**73RD AMENDMENT ACT: THE THIRD STRATUM
KARNATAKA'S NEW STEP BACKWARDS**

Would 16.64%* for 5 years, redeemable after 3 years, increase your
interest?

*Annualized yield, computed @ 16% p.a., payable half-yearly

ICICI Bonds

the bonds provide the yield — the name assures the safety.

PUBLIC ISSUE OF 16% UNSECURED, REDEEMABLE BONDS IN THE NATURE OF PROMISSORY NOTES OF RS. 1000/- EACH FOR CASH AT PAR AGGREGATING RS. 200 CRORE WITH A RIGHT TO RETAIN OVERSUBSCRIPTION UP TO RS. 200 CRORE (IN ALL RS. 400 CRORE)

HIGHLIGHTS

- One of the premier all India development finance institutions in the country
- Assisted over 4000 companies for over 8000 projects involving total disbursements of over Rs. 14000 crore
- Uninterrupted dividend payment since 1986 (i.e., from the second year of operation).
- Compound annual rate of growth (CARG) in profits of over 25% over the last 5 years
- Professional Management — Board of Directors comprises personalities having vast experience in various fields
- Terms of the Issue
Face Value Rs. 1000/-

Interest 16% p.a., payable half-yearly
Maturity 5 Years

- Easy liquidity
A Bond is transferable by endorsement and delivery. B Listing on Bombay Stock Exchange. C Option to call for redemption on the expiry of 3 (three) years from the date of allotment.

RISKS AS PERCEIVED BY MANAGEMENT

- The present issue of Bonds carries the following normal risks associated with the activities of a development finance institution
- Projects financed by the Company could encounter delays in implementation, overruns and, in some cases, failure as well

- Recent deregulation of interest rates could expose the Company to risks arising out of fluctuations in the interest rates
- The Company could expose itself to a liquidity risk if there is a maturity mismatch between its assets and liabilities
- Due to the current and expected non-availability of low-cost funds through Government guaranteed bonds, the Company has to resort to tapping funds from various commercial sources including the capital markets.
- The Company has entered into interest rate and currency swaps. This involves some risk to the Company arising from possible default by counterparties.

Women's Agency: Limits and Possibilities

The question of women's agency is central for feminists, both in relation to practical organisation and to historical reconstruction. Marxist and socialist feminists have worked with a notion of *direct* agency, at the point of its emergence into self-consciousness and its transformation into collective political will. However, women's agency remains problematic in both theory and practice. Because women are simultaneously class differentiated and subject to the frequent cross-class expansion of patriarchal ideologies, their agency is not open to historically self-evident modes of collectivisation. More attention needs to be paid, therefore, to socially structured and often sanctioned forms of *indirect* agency, in their specific articulation of consent and resistance as significant signs of the ways in which men and women make their histories or are inhibited from doing so. **867**

Panchayats and Self-Government

The Constitution (73rd Amendment) Act has in essence constitutionalised panchayats as a third stratum of government at and below the district level. Its implications are far-reaching and perhaps not fully grasped even by those who legislated the measure. **859**

The enactment of the new Karnataka Panchayat Raj bill in replacement of the earlier Act of 1983 reveals not so much a commitment to progressive decentralisation of government as a unanimity among legislative members belonging to all parties on strengthening their hold on panchayati raj institutions. **847**

Dealing with Public Debt

The answer to our current concern about the size and burden of internal public debt is certainly not to take fright and slash government expenditure in order to reduce public borrowing. Policy-makers should instead focus attention on reviewing the allocation of government expenditures with a view to allocating the maximum possible proportion of these expenditures in areas and in a manner that contribute to the growth of national income. **883**

Mothers and Workers

Much concern is currently being expressed about the trend towards decline in breast-feeding and its implications for the health and development of children. The efforts being made to promote breast-feeding through social policy and new legislation consequently tend to focus attention almost exclusively on the welfare of the child. However, keeping in mind women's dual roles as workers and citizens on the one hand and mothers on the other, it is necessary to raise certain issues related to working mothers and the law so as to take a more balanced view of the needs of both women and children. **887**

Paying for Education

While higher education does involve significant externalities justifying some element of subsidy in its provision, consumers ought to be made to pay a price which is commensurate with their annualised private benefits. **891**

Illusion of Access

The market access which the Dunkel proposals appear to provide for agricultural produce of countries like India is illusory because these countries do not have a comparative advantage in agricultural exports. The market access approach together with the proposals with regard to intellectual property rights will on the other hand raise agricultural costs and render further non-competitive agricultural and industrial products from these countries. **8**

Forests and Floods

The Centre for Science and Environment's third Citizen's Report on the state of India's environment has sought to question the view, vigorously propagated by environmentalists, that afforestation of the Himalayas is the sustainable solution to the problem of floods in the northern and eastern plains of the Indian subcontinent. **849**

Money in Rural Banking

There is nothing inherently non-viable about banking in the rural areas. The much-talked-about losses of banks' rural branches have to be attributed to the incompetence of individual banks' managements. **853**

LETTERS TO EDITOR

Plight of Bhopal Gas Victims

THE victims of the world's biggest industrial disaster—the Bhopal gas leak disaster of December 2/3, 1984—continue to suffer in various ways. Till January 30, 1993 only 1,710 cases (out of a total of over 6,00,000 claims, including 14,000 claims on account of death) had been decided upon in the 30 claim courts. Meanwhile, the payment of interim relief to over 5,00,000 victims, which had been going on for the last three years, ceased from April 1993. It had been loudly proclaimed that it was to provide immediate relief to the victims that the settlement of February 1989 with Union Carbide Corporation had been hastily concluded. But, while the victims who are in acute need of immediate relief have been left in a state of helplessness, even the absurdly truncated settlement sum lying in the custody of the Supreme Court remains largely unutilised. Given the tardy pace of adjudication of claims, should not a simpler and speedier method be evolved to disburse the compensation? Is it not a fair demand that interim relief to the gas victims be continued until their claims are adjudicated?

As a result of intense lobbying by victim groups, the government of India had on March 5, 1990 allocated a sum of Rs 360 crore as interim relief for the Bhopal gas victims. The interim relief, which was to benefit 5,00,000 victims, was to be adjusted against their final compensation. While the last instalment of interim relief was paid in March, the process of adjudication of claims has been extremely slow. At the rate at which it is progressing it will take several years for the 6,00,000 odd claims to be settled. Therefore, in order to mitigate the hardship the victims may face until their claims are amicably settled, the demand was made of the government that it continue to pay interim relief as it had done during the last three years.

The government may not have to mobilise additional resources for continuing the interim relief. There was an alternative suggestion. It was pointed out that the settlement sum of \$ 470 million paid by UCC in March 1989 now amounts to over Rs 2,000 crore (at the current exchange rate) and generates interest of around Rs 200 crore per annum. The total amount that is required to pay interim relief to the victims annually (which is about Rs 140 crore) could easily come out of the interest that is accruing on the settlement sum. The task of continuing interim relief need not, therefore, become a financial burden on the government.

It was also pointed out that the government had set up a special industrial area for the economic rehabilitation of the gas victims. Despite several representations, the government has not taken any step regarding economic rehabilitation of the gas victims. The demand, therefore, was that the government immediately provide additional jobs

by setting up appropriate industries in the industrial area earmarked for gas victims.

In the claim courts where poor victims have to plead their case themselves, compensation has unjustly been denied in 1,152 cases or almost 70 per cent of the 1,710 cases adjudicated so far. While in the 558 cases where compensation has been awarded, the amounts have been miserably low. Another disturbing fact is that the quantum of compensation is being determined only according to the wages lost due to death or injury. An alternative and more equitable scheme would be to allocate a fixed sum of money to every resident present on the night of December 2/3, 1984 in the 36 gas-affected wards of Bhopal. This would ensure a basic minimum of compensation to all gas victims. The underlining assumption is that all those who were present in the gas-affected areas must have inhaled a significant amount of the toxic gases.

It is reliably learnt that the government has discontinued 24 of the 26 studies on the effects of the toxic gases on the life systems of Bhopal. If the government has, indeed, moved in that direction, it is a highly deplorable step. The government must desist from any attempt to discontinue research on the effects of the toxic gases. The government must also be asked to make public the results of all studies carried out by the Indian Council of Medical Research and other agencies on the effects of the toxic gases. Lack of access to such information, on the one hand, denied the gas victims a source of vital evidence which could strengthen their claims for adequate compensation. On the other hand, the judges of the claim courts, who are totally unaware of the medical consequences of the toxic gases, cannot be expected to give fair judgments in the absence of adequate information on the nature of the injuries sustained by the gas victims.

The Bhopal gas tragedy is certainly an issue of national concern and political dif-

ferences must not stand in the way of relief, rehabilitation, compensation disbursement, medical research, criminal prosecution and other related matters. It would be a matter of national shame if the nation continues to remain indifferent to the tragic plight of the Bhopal gas victims. It is hoped that all concerned people from all walks of life would again come forward to speak up for the gas victims.

Maltreatment of Working Children

THE members of Bhima Sangha are children who are working for a livelihood. Though our contribution amounts to 20 per cent of the GNP of our country, we remain deprived of basic facilities and rights. We are constantly ill-treated. To protest against these, we have created this forum through which we are determined to build a better future for ourselves. For this, we need support from all of you who are concerned about working children.

Maltreatment of working children in the hotel industry must stop. To move ahead in this direction we have the following appeal to make: To effectively stop such atrocities, a special committee should be set up. This committee should consist of officials from the labour department, officials from the corporation, officials from the police department, representatives from organisations like the Concerned for Working Children and Bhima Sangha. This special Task Force must be given powers to check the violence and labour mismanagement in the hotel industry.

Radha, Gulzar, Naywani, Vinayaka and Others.

Bhima Sangha,
Bangalore.

No Escaping EFF

THE obviously orchestrated reports on the government's intentions with regard to further borrowing from the IMF have sought to suggest that difficulties have arisen because its ability to satisfy the quantitative performance criteria and the policy benchmarks prescribed by the multilateral agencies is wearing thin, particularly against the background of the fragile socio-political situation in the country. Earlier indications were that the government would go in for additional borrowings under the IMF's extended fund facility (EFF) in combination with the enhanced structural adjustment facility (ESAF). There was an explicit commitment to that effect in the government's memorandum of economic policies for 1992-93 submitted to the IMF in early June 1992 as part of the requirement for the current stand-by arrangement. But more recently the government has been trying to convey the impression, through inspired reports in the press, that it would seek assistance from the IMF via some alternative route, not the EFF/ESAF one.

It is true that the fiscal deficit target of Rs 35,450 crore (or 5 per cent of GDP) for 1992-93 may be missed by a wide margin. There have occurred large shortfalls in the government's revenue collections as also in the sale of shares of public sector undertakings. While the revised estimates for 1992-93 had put the budget deficit at Rs 7,202 crore, it may now turn out to be at least Rs 3,500 crore more. Considering the persistence of recessionary conditions, further fiscal compression in pursuit of the IMF-dictated target of fiscal deficit would be suicidal. Financial sector reform has similarly come up against formidable roadblocks. Finally, some questions may also be raised about whether India really needs fresh balance of payments support right now since official data show the level of the country's foreign exchange reserves to be around \$ 7 billion.

The IMF is, however, playing for much bigger stakes in India and it is not likely that relatively limited technical considerations such as those mentioned above are what will count in the ultimate analysis. The completion of the process of opening up of the Indian economy will be a big feather in the cap of the IMF bureaucracy and it is not surprising, therefore, that the Fund's managing director, Michel Camdessus, has chosen to state publicly that he is looking forward to

giving more assistance to India under EFF/ESAF. He has expressed satisfaction over the pace of India's reforms so far as also over the programme for the future as spelt out by the Indian government. That apart, it is not likely that the IMF's Board will now agree to let India borrow under conditionalities less rigorous than those stipulated for EFF/ESAF loans. Following the well established pattern, stand-by arrangements typically cover periods of one to two years with the focus on macro-economic policies. As Camdessus has himself emphasised rather pointedly, a stand-by programme is only the beginning and the Indian government's commitment to open up the economy, effect major structural changes, push ahead with privatisation and ensure more effective use of public resources (a euphemism for cuts in government expenditure, especially public sector investment outlays) "can fit in very well with the kind of strategy we can support particularly under EFF or ESAF". Thus the slippage in some of the technical performance criteria notwithstanding, the IMF is all set to welcome India under the EFF/ESAF umbrella so that the liberalisation and structural adjustment processes can be pushed through even more vigorously.

On the government of India's part, the logic of the economic policies it is pursuing leaves it no option but to make the inevitable transition from the present stand-by arrangement to borrowing under EFF/ESAF, however bitter the consequences of this for the large majority of the country's people. The government's posture of not wanting to borrow under the EFF can be taken seriously only if there were some evidence of its readiness to pursue more independent economic policies which would reduce the need for exceptional financing from the multilateral agencies. In fact, without such a drastic change of economic policies, even the additional funds pumped in under the EFF will not resolve the structural imbalances in the economy. After all, despite a \$ 5 billion borrowing under the same EFF in 1981-82 and despite the windfall of a sharp rise in domestic petroleum production, it did not take very many years for the Indian economy to find itself back to square one in terms of having to knock at the IMF's doors to be bailed out all over again.

POLITICS Creating Space for Fanatics

DEMOCRATIC rights have always been a scarce commodity in India for ordinary citizens. But they are generously offered by the state to fanatics of all shades—communal, chauvinist, xenophobic, obscurantist. Their 'democratic' right to propagate venomous prejudices against minority communities, indulge in all sorts of parochial caprices, and organise communal riots, is indefatigably defended by the executive, the police, the judiciary—and, on certain occasions, even by politicians of all hues. Anyone daring to exercise the constitutionally guaranteed right of expressing any opinion that may be different from that held by these fanatics is immediately hauled up by the state.

We thus watch the curious spectacle of the Shiv Sena chief Bal Thackeray enjoying all immunity against prosecution despite his repeated nonchalant avowal of his followers' participation in the Bombay riots. Yet when an innocuous article appears in a weekly reiterating old historically recorded facts about Shivaji, the government immediately clamps a ban on the publication—to the satisfaction of the Shiv Sena. It seems that the state government of Maharashtra has handed over to the Sena the right to administer affairs in the film world there. It decides which actor or actress should be debarred from productions, according to the Sena's perceptions about their degrees of patriotism, or lack of it! It can not only dictate terms to the producers and directors, but can also stop the exhibition of any film which may have an actor who is not acceptable to the Sena.

The anxiety to protect the 'democratic' rights of communal organisations like the Shiv Sena is not peculiar to the state government of Maharashtra. Take Uttar Pradesh, which is now under central administration. Soon after the demolition of the Babri mosque (carried out under the direct supervision of the then BJP government there), the 'kar-sevaks' were allowed to install some idols on the spot. A brick structure is now coming up there to protect those idols, with the administration going out of its way to permit the construction—thus paving the way for the Sangh parivar's ultimate plan to build a temple there. Whenever the Naxalites in some obscure village of Andhra Pradesh build a memorial for their martyrs, the ever-alert administration immediately sends the police to demolish it. But in Ayodhya, the Sangh parivar is given a free hand to demolish an ancient historical monument, and replace it with some

structure to mark the fictitious birthplace of an imaginary hero.

The judiciary has not been far behind in indirectly lending credence to what appears to have become a national duty to uphold the 'democratic' right of all those who swear by the mumbo-jumbo of Hindutva. In Uttar Pradesh, the court was reported to have expressed its anxiety to provide a firm roof for the idols in Ayodhya. In West Bengal, the court overruled the state government's ban on the BJP rally and allowed the Sangh parivar leaders (most of whom belonged to the banned organisations, RSS and VHP) to address a public meeting. In Orissa, the court has issued orders on the Cuttack administration to open the lock put on the office premises of the VHP there. The honourable judges, of course, quoted laws in defence of their judgments.

Our ambiguously worded legislations always provide loopholes for hair-splitting sophistry. But is it just coincidental that such casuistic interpretations of the laws are opening up legitimate space for exactly those forces which by all standards are fascist?

GOVERNMENT FINANCES Blaming the States

IT is a standard practice now for the *Economic Survey* to cover in its review of fiscal developments during the year not only the finances of the centre but also the finances of the states and union territories. Following this practice, the *Economic Survey 1992-93* includes a section on the latter, which starts with these words: "There was a sharp deterioration in the finances of the states and union territories in 1991-92 with the combined budgetary deficit touching Rs 1,896 crore as compared to only Rs 139 crore in 1990-91." Does this statement really stand scrutiny?

What the authors of the *Economic Survey* have done is to compare the revised estimates of budgetary deficit for 1991-92 with the actuals for 1990-91, overlooking the fact that there could be considerable divergence between the actuals and revised estimates for the same year. To illustrate, the revised estimate of deficit for 1990-91, for the states alone, was Rs 429.4 crore (as against the budget estimate of Rs 1,742.6 crore). The combined actuals for states and union territories turned out to be less than a third of the revised estimates. It should be added that the ability of the states to actually incur deficit depends very much on the willingness of the centre to release ways and means advances to the states and bears little relationship to what the states provide on this account while preparing

their budgets. It is, the authors of the *Economic Survey* seem to have ignored, inherent in the budgeting exercise of the states and union territories, more than that of the centre itself, that the actuals are far below the budget and revised estimates. Any judgment based on such faulty comparisons is seriously flawed and is bound to be overdrawn one way or the other.

But deterioration in state finances, even going by the actuals, will have to be assessed with far more caution than seems to have been exercised in the latest *Economic Survey*, which is obviously in a terrible haste to take whatever credit it can for central transfers to the states to reduce the gap between current revenue and total outlay. The increase of Rs 13,998 crore between 1990-91 and 1991-92 (RE) in the current revenue of the states and union territories is attributed "almost entirely to an increase in grants from the centre and the states' share of income tax and union excise duties collected by the centre". The budget documents of the centre do not, to say the least, bear out this claim.

Between the two years, the actual amounts transferred to states and union territories by way of grants declined by Rs 81 crore and those by way of share of income tax and excises increased by Rs 2,662 crore; the net increase in revenue account transfers was thus Rs 2,581 crore, that is, 18 per cent of the increase in the current revenue of the states and union territories. Assuming that the actuals did not fall far short of the revised estimates of their total revenue receipts in 1991-92, it is clear that the bulk of this increase was secured by the states and union territories on their own steam.

Why were the authors of the *Economic Survey* in such a hurry to make these untenable claims when they must have had available to them the figures of actual transfers effected to the states and union territories? Obviously to cover up the fact that the centre's own tax effort measured as a proportion of GDP left so much to be desired.

HEALTH Dark Areas

AMONG the important sectors which will be affected by structural adjustment programmes, directly and indirectly, will be health. This is not only because financial allocations for the health sector in general are going to fall, but also because the deteriorating socio-economic conditions for the majority will generate an increased demand for health services. However, if appearances are to be kept up, attempts must be made to prescribe a cure for the ailing health system and this is just what

the World Bank has done. In a recent review of the health sector, the World Bank is at pains to point out that health and family welfare have received a declining share of total spending after 1970 with a 'precipitous decline' after 1980. Taking the central budget of 1992-93 as a 'first test' of the government's interest and ability to respond positively to adjustment, the review professes to have been shocked to find that the allocation for health had remained more or less unchanged from the previous year's. In fact taking into consideration the special assistance of Rs 80 crore for the AIDS programme, the central allocation had actually dropped and budget cuts of up to 40 per cent had been made in vital programmes like malaria eradication, whereas the allocation to programmes with few 'externalities' had risen at the expense of those which benefit the poor. On a self-congratulatory note it goes on to point out that the finance minister was prevailed upon to 'adjust' the health allocation upwards. The review's prescriptions for a healthier future include: strengthening the health budget and doubling allocations to endemic disease programmes; improving equity and targeting externalities, that is restoring cuts to disease programmes which affect large numbers; defining an effective package/standard of input to primary level institutions; protecting capital investment by ensuring maintenance budgets; improving cost recovery from the affluent for hospitals (currently less than 1 per cent of the cost is collected from patients and this should be increased to 20 per cent); and enhancing private sector effectiveness by adequate quality control.

What has been the impact of this advice on the central budget for the health sector in 1993-94? The total plan and non-plan allocation for 1993-94 is Rs 2,060.47 crore, an increase of 15.4 per cent over the revised estimate for 1992-93 and 31 per cent over the budget estimate for that year. This represents a minuscule 1.58 per cent of the total estimated plan and non-plan expenditure of the centre. Although central allocations for health comprises only about 6 per cent of the total public expenditure on health, they set a trend motivating state spending. Moreover, the central allocations go to epidemic disease programmes which have large externalities. The current budget thus shows no signs of a change in perspective. Slightly more than 62 per cent of the total (Rs 1,280.72 crore) goes to the family welfare programme. It has often been pointed out that this causes a distortion in priorities which goes beyond the expenditure figures. Family welfare (earlier family planning) has continued to take an

increasingly large share of the total central budget allocations for health—rising from 1.3 per cent in the First Plan to 49 per cent in the Sixth Plan. Family planning comprised 1.8 per cent of the total allocation for all sectors in the Seventh Plan. In the current budget 2 per cent of the total has been earmarked for family welfare, the same as in 1992-93.

Of the total health and family welfare budget, epidemic disease programmes account for 15.4 per cent. Of this, the major portion, about 29 per cent, goes to the National Malaria Eradication Programme (NMEP) and 23 per cent to the National AIDS Control Organisation. The World Bank review points out that the budget cut in the health sector has particularly affected disease control programmes, with the NMEP suffering a massive reduction. The allocation in the 1993-94 budget does mark a restoration of the cuts made earlier, but hardly reflect any awareness of the seriousness of the spreading incidence of malaria. Similarly, although the allocation for the TB control programme has almost trebled over 1992-93, it only comprises 11 per cent of the public health budget. And this when the *Economic Survey* acknowledges that an estimated 1.5 per cent of the total population is currently affected by the disease. Clearly, if this is the situation after so many decades, it would mean that the programme has been inadequate and weak and requires strengthening. Interestingly, while the *Economic Survey* has also shown concern over leprosy, pointing out that 2 million people are estimated to be suffering from the disease, the proportionate allocations for the programme has remained static at 11 per cent of the public health budget and it is the only programme which has not been allocated increased funds over the revised estimate of 1992-93.

A point worth mentioning here is that public health expenditure comprises only a small proportion of total expenditure on health. One study indicates that the per capita private expenditure on health is 10 to 15 times that spent by the state and accounts for 7.6 per cent of total household consumption expenditure. This trend of increasing private expenditure on health is bound to gain strength, especially if World Bank prescriptions of cost recovery in health are followed.

SPECIAL 301

Well-Timed Bullying

IT is remarkable how the US and the rest of the western world together with Japan have penetrated the markets of the

developing countries and of eastern Europe, including the erstwhile USSR. To achieve this they have exploited every multilateral and bilateral forum to their advantage. Their dominance of the boards of the World Bank and the IMF has been used to browbeat the developing countries into accepting a patently iniquitous world economic order. And having achieved their goals in the international product markets, they have shifted their attention to trade in services, to trade-related investment measures (TRIMS) and to trade-related intellectual property rights (TRIPS). The US has been particularly concerned about these areas and, finding some important developing countries such as India and Brazil somewhat hesitant to fall in line, it has adopted aggressive postures. Thus came the Super 301 and Special 301 under the US Omnibus Trade and Competitiveness Act of 1988 and the threat of naming countries in the 'hit list' under these provisions with the objective of forcing them to enter into negotiations and eventually accept the US demands.

It cannot have escaped the notice of the US and the other developed countries that opposition is building up in India to the country accepting the Dunkel Draft proposals, particularly those relating to TRIPS and, among them again those dealing with patenting of food, medicinal, agricultural, horticultural and biotechnology-related products. While the bureaucracy and the political leadership in the country have blown hot and cold on these issues right from the start of the GATT negotiations, the opposition from farmer interests and from the progressive intelligentsia has certainly made an impact.

The Indian Patents Act, 1970 has stood the test of time in striking a balance between investors' interests and societal concerns. The provisions under the Act for grant of only process patents for food, medicines, drugs and bio-chemical substances and for denial of patents for atomic energy, agriculture and horticulture have been shown to be necessary for the country at its present stage of development. It is well known how today's advanced nations, when they were at the developing stage, resisted product patents or did not have patent laws at all. Actual experience across countries has brought out that prices of generic drugs have invariably remained much lower than those of patented products. And introducing patentability into agricultural and horticultural products, in which many MNCs have acquired a dominant position, will have serious consequences for a still predominantly agricultural economy such as India's.

Precisely when opposition is building up in India to the Dunkel Draft, the US has once again named India as a 'priority foreign country', along with Brazil and Thailand, under the Special 301 provisions of the Trade Act on the ostensible ground that not enough progress has been made over the past one year towards providing effective patent protection in India. The objective seems to be to force India to tone down its position in the GATT negotiations on TRIPS. Against this background, the government of India is not confronting the basic issue when it asserts, by way of a response to the US action, that multilateral forums, such as the GATT, are the best means for resolving such disputes. As it is, the government lost more than half the battle when it, along with China, caved in and agreed in the first place to negotiations on services, TRIPS and TRIMS as part of the GATT system. But even at this late stage it is necessary to take a clear position that the provisions of the present Indian law regarding patenting of agricultural and pharmaceutical products are not negotiable, whether bilaterally or multilaterally.

INDIA-PAKISTAN RELATIONS Nuclear Brinkmanship?

A correspondent writes:

SEYMOUR HERSH is not a stranger to the Indian public. Whether or not one accepted the results of his investigations into the existence of a CIA mole in Indira Gandhi's cabinet, it goes to his credit to have exposed the fact that the CIA had access to the goings on at the highest level of decision-making in India.

Now Hersh has come out with the disclosure that when, in mid-1990, the Bush administration dispatched Robert Bates, the deputy national security adviser to the US president, to Pakistan and India on an urgent mission, it was only after it "became convinced that the world was on the edge of a nuclear exchange" between the two countries. One of the key informants of Hersh was a former CIA officer, Richard V Kerr, who "co-ordinated the intelligence reporting in May of 1990". According to Kerr: "It was the most dangerous nuclear situation we have ever faced... It was far more frightening than the Cuban missile crisis."

Still the Bush administration had then formally debunked reports in the US media of an India-Pakistan nuclear crisis as exaggerations. Why? Hersh's explanation is that the US intelligence community has been haunted by the fact that "the Reagan administration had dramatically aided Pakistan in its pursuit of the bomb"

turning a blind eye to "illegal Pakistani enrichment activities"—and those too mainly in the US itself. That the CIA was engaged in what Hersh refers to as "constant spying" in India as well as Pakistan is fully documented. US analysts had concluded in the mid-70s that India had gone nuclear. As for Pakistan, the CIA had "a complete set of floor plans for an ambitious uranium enrichment plant at Kahuta". And once Kahuta was operational, it "found a way out to obtain first-hand information, in detail, about nuclear weapons work there". Another facility, this one for manufacturing weapons grade enriched uranium metal near Islamabad but not at Kahuta, was also known to CIA. And despite all this information, the Reagan and Bush administrations continued to certify Pakistan as non-nuclear. So how could the Bush administration all of a sudden admit publicly that India and Pakistan were on the verge of nuclear war? And that too when the CIA information, based on its monitoring of the movements in and out of Kahuta and other facilities, especially the one in Baluchistan, led it to the conclusion that Pakistan was readying for a first strike. Hersh reports an American analyst who participated in White House 'situation room meetings' as saying: "We thought the reason for the evaluation of Kahuta was that they expected a retaliatory attack by India, in response to a Pakistani first strike."

Whether or not a nuclear war between India and Pakistan had been so imminent in mid-1990, Hersh does establish one point, namely, that the situation did seem to the US watchdogs of the scene on this subcontinent to be leading to such a conflagration. It also appears that during this period not only was India having a rather weak administration headed by V P Singh, but also in Pakistan the administration of Benazir Bhutto was flagging and security decisions had more or less been pre-empted by Ghulam Ishaq Khan, the president, and his trigger-happy army chief, General Beg.

Now once again the subcontinent faces a situation in which Ghulam Ishaq Khan has taken over the reins of power in Pakistan with an army chief of his choosing at his beck and call. In India the government of Narasimha Rao is getting weaker by the day, thanks to the internal party dissensions in the Congress and the continuing economic stalemate. Given that both countries possess a nuclear strike capability, should we not be worrying about the likelihood of a mid-1990-like scenario building up again? Of provocations there is unlikely to be any lack on either side. The Bombay blasts need not be the last episode of the suicidal game.

TWENTY YEARS AGO

EPW, April 28, 1973

Whatever be its influence on the governance of the country in the years to come, the case involving the 24th, 25th and 29th Constitutional amendments, on which the Supreme Court pronounced judgment on Tuesday, has already shaken up the Court's statistical records. The case was heard by 13 judges, the largest bench ever of the Supreme Court, and the 69 days of arguments made the hearing the longest ever in the Court's history. The counsel for the petitioners argued for 33 days, the counsel for the Kerala government for 22 days and the attorney-general for 10 days. In all 93 lawyers were retained by the various parties, including several state governments. The joint and several judgments of the judges apparently ran into 1,240 foolscap pages. The one figure that is not available yet is that of the total cost of this many splendoured legal battle to the private parties, to the various governments and to the Court. It is to be hoped that some cost-benefit enthusiast will shortly undertake the necessary calculations.

It has been claimed that as a result of the Court decisively reversing its earlier ruling in the Golaknath case, parliament's "sovereign power" to amend the Constitution has been restored. This is one aspect of the Supreme Court's verdict... Another aspect... While acknowledging parliament's right to amend the Constitution, the court has nevertheless kept to itself sizeable authority to sit in judgment on the constitutional amendments that may be actually enacted by parliament. This is evident in regard to three issues at least.

First, nine of the 13 judges have ruled that while under Article 368 parliament may certainly amend the Constitution, the article does not "enable parliament to alter the basic structure or framework of the Constitution". What exactly constitutes the basic structure and framework of the Constitution has been left to be decided by the Court as and when the occasion arises.

The second area retained for judicial review by the Court relates to Article 31 (C) of the Constitution introduced through the 25th amendment. Under the first part of this article, which has been unanimously upheld by the Court, no law giving effect to the Directive Principle of the Constitution dealing with control and ownership of the material resources of the community so as to subserve the common good and so as to prevent concentration of wealth and means of production shall be deemed to be void in the ground that it abridges or takes away the Fundamental Rights mentioned in Articles 14, 19 and 31. However, by a majority of nine to four the Court has declared invalid the second part of Article 31(C).

Third, by a majority of 8 to 5 the Court has decided that in the case of acquisition of private property by the state, though the word "amount" has been substituted for "compensation" in Article 31(C) through the 25th amendment the "amount" should still bear a reasonable relation to the value of property acquired and must not be "arbitrary" or "illusory". To that extent the objective of the 25th amendment to put compensation for private property acquired by the state beyond the pale of judicial review has been at best only partially fulfilled.

Bharat Zinc

BHARAT ZINC is promoted by the Gupras, Hari Mohan, Madan Mohan and Rajiv Mohan, who own the daily *Dainik Jagran*. It is setting up at Mandideep in Madhya Pradesh a Rs 7.83 crore project with a capacity of 2,800 tonnes per annum of electrolytic grade zinc and 4,253 tonnes per annum of GOB zinc metal. The project cost, appraised by the IFCI, was originally placed at Rs 4.70 crore in March 1991, but was revised to the present figure in December 1992. It is to be met with equity share capital of Rs 4.62 crore (promoters' contribution being Rs 1.14 crore) and Rs 3.60 crore of loans from the Madhya Pradesh Audhyogic Vikas Nigam. The company already has on books a paid-up share capital of Rs 1.50 crore. It is issuing now 31.20 lakh shares of Rs 10 each at par, offering out of this 12 lakh shares to the NRIs and the balance 19.20 lakh shares to the public. The issue opens on May 3 under SBI Capital Markets and IFCI as lead managers. The company is to procure 40 per cent raw material requirements from indigenous sources and import the rest 60 per cent from the US, Germany and Canada. Sulphuric acid is to come locally. IFCI has projected for the company sales of Rs 31.07 crore at 60 per cent capacity utilisation for 1993-94, Rs 36.25 crore at 70 per cent capacity utilisation for 1994-95 and Rs 41.43 crore at 80 per cent capacity utilisation for 1995-96. Net profit is estimated for the respective years at Rs 1.79 crore, Rs 2.08 crore and Rs 2.43 crore. EPS is placed at Rs 3.87, Rs 4.50 and Rs 5.25 respectively for the three years, while the IFCI has estimated dividend at 20 per cent for the very first year.

Aircommand Airtechnics

Aircommand Airtechnics is another venture by the Panthaki family in Gujarat in the area of portable airconditioners after Aircommand India which came in the market in April 1991 for its Rs 6.50 crore project. There is a third company, Aircommand International, which caters to exports, and which has plans to go into shrimp farming and production of animation films. Aircommand Airtechnics is to use the same brand name of Aircommand India for its airconditioners. It is engaged since incorporation in the year 1984 in trading in airconditioners and components. From trading, it is now going into manufacture of airconditioners. Its project is appraised by Bank of India at Rs 18.35 crore. This is being financed with equity share capital of Rs 15.50 crore (promoters' contribution amounting to Rs 6.20 crore), lease finance of Rs 2.20 crore and unsecured loans of Rs 50 lakh. The project at Waghodia Industrial Estate, Gujarat, is to cover production of 3.25 lakh units of portable airconditioners and 25,000 units of window airconditioners.

Trial production is expected in August this year and commercial production is to start from September. BoI projections are Rs 180 crore turnover at 30 per cent capacity utilisation for 1993-94 with net profit placed at Rs 2.80 crore and EPS at Rs 2.80. The company is issuing 1.35 crore equity shares of Rs 10 each at par and offering 88.35 lakh shares to the public on May 4 under Subhash Dalal Financial Consultants as lead manager.

Gujarat Narmada Knitwear

Gujarat Narmada Knitwear is a promotion by Hasmukh Desai as a 100 per cent EOU for export of cotton yarn and knitted garments. Since such exports now fall within the purview of GATT's multifibre agreement, they are regulated by quota system. Initially, Gujarat Narmada Knitwear will be buying export quota from the market at premium ranging from 10 to 15 per cent. It will be only after it establishes its potential that it will be allotted a quota by the government. Capacity in use will be restricted to 40 per cent for the first year and will not be more than 60 per cent till the year 1995-96. Nevertheless, the company has projected a 15 per cent dividend in the very first year. It has been sanctioned a concessional World Bank credit line by Bank of Baroda. BoB has appraised the project to cost Rs 5.98 crore at Panoli in Bharuch district, Gujarat, to manufacture 11.25 lakh kg of dyed fabric and 24 lakh garment pieces annually, all for export. The company expects to explore non-quota markets for

exports and has, besides, entered into an agreement with a firm in the UK and another in Canada for marketing its products abroad. The project cost is being covered by a BoB term loan of Rs 1 crore and equity share capital of Rs 4.70 crore of which the promoters are contributing Rs 1.30 crore. The company is issuing 23.90 lakh shares of Rs 10 each at par to the public on May 5 with BoB and Gujarat Lease Financing acting as lead managers.

IPCL

Indian Petrochemicals Corporation (IPCL) will be making a rights offer to its existing public shareholders. A decision to this effect was taken at a board meeting of the company held on April 19. The issue will involve offering a maximum of 2.85 crore equity shares of the face value of Rs 10 each on rights basis at a premium not exceeding Rs 40 per share. The offer is proposed to be in the ratio of one equity share for every five fully paid up equity shares held on the record date to be fixed. However, a minimum of 100 shares will be offered to a shareholder whose name appeared on the register of members as on April 19 and continues to so appear on the record date. For employees who were allotted shares reserved in the issue that closed on November 19, 1992, the offer is proposed to be in the ratio of one equity share for every one fully paid up equity share held. The date of the issue will be decided in due course after all the formalities are completed.

HIGHER EDUCATION REFORM IN INDIA

Experience and Perspectives

SUMA CHITNIS & PHILIP G ALTBACH (editors)

The higher education system in India has experienced immense growth since the country achieved independence in 1947. Universities and colleges have had to cope with massive and often unplanned expansion. In response, periodic attempts have been made by the concerned authorities to reform the system. This volume constitutes the first full-scale analysis of the efforts at reform and the changes that have taken place in Indian higher education in the past four decades.

Trailing the Market

Jairaj Kapadia

THE hitherto wholly state-owned Indian Petrochemicals Corporation is appealing investors after it opened its doors to the public with a share capital issue it made four months ago at a premium of Rs 150 per share for an aggregate amount of Rs 320 crore. It has now decided to make the investors who had subscribed for that issue and become the shareholders a rights issue of 2.85 lakh shares of Rs 10 each at a premium of Rs 40 per share in the ratio of one-for-five and in a higher ratio of one-for-one to those of the subscriber-shareholders for the earlier issue who were allotted the shares from out of the employees' reserved quota. It is not clear who this category of shareholders whom the IPCL is placating are, but they are

more likely to be institutional investors rather than the common public, as institutional investors are usually the beneficiaries picked out for allotment of unsubscribed surplus out of employees' quota of capital issues by the companies. As these are offered rights shares in 1:1 ratio, the average price of their shareholdings is to amount less at Rs 110 as against Rs 142 for the rest of the subscriber-shareholders for the earlier issue.

The IPCL board meeting in Bombay on April 19 decided to make the rights issue at Rs 40 premium clearly to make amends for the high premium of Rs 150 per share at which it had made the public issue four months ago. Since then, against the issue

price of Rs 160, the IPCL share has been eroded on the market by 38 per cent to Rs 100 currently, and the management has professed to make good investors' losses by proposing a rights issue at almost one-fourth the rate of premium fixed for the public issue. The rights issue coming close on the heels of the public issue also demonstrates the urgency of funds for IPCL for its massive Rs 3,484 crore integrated gas-based petrochemicals complex at Baroda and the downstream units near Bharuch.

After the proposed rights issue the average price of the shareholdings, because of the premium differential compared with the public issue and the difference in the ratio of rights, is to work out to Rs 110 for those shareholders who got the unsubscribed employees' quota out of the public issue and for the rest of the shareholders to Rs 142. However, this is still more than the current market price of IPCL shares of Rs 100. This, besides, is the present price. What the price might be after the rights issue, it remains to be seen. If it turns out to be still less, even the Rs 40 premium for the rights issue may prove high, just as the Rs 150 premium had for the public issue.

When that rate of premium was fixed by IPCL for the public issue, it was without reference to the market price, as IPCL was then not listed on the stock exchanges. After the issue opened and the share was listed, it was quoted at once at a discount over the issue price. IPCL had then demanded spot trading in the share from the stock exchanges. But that had not helped secure a higher market rating.

NEW INDIA SUGARS

Rise in Production

Profit before tax of New India Sugar Mills during the year ended June 30, 1992 more than doubled from Rs 68 lakh to Rs 154 lakh. But of this Rs 130 lakh has gone as tax while from the remaining surplus the dividend has been declared at Rs 3 per share, the same as in the previous year. The increased results with net sales improving from Rs 2,175 lakh to Rs 2,902 lakh have been despite average sugar recovery working out lower as compared with the previous year in both the sugar factories of the company at Hasanpur and Sidhwalia in Bihar. But while sugar recovery was lower in the Hasanpur factory at 9.54 per cent (10.2 per cent the previous season), it was the second highest among all of sugar factories in Bihar. In the Sidhwalia factory, however, the average recovery was down by more than one percentage point from 9.26 per cent to 8.24 per cent. The lower recovery was due

* Rs 20.19 preference dividend. ** Rs 12 lakhs preference share capital

to the longer duration of the crushing season (234 days as against 176 days in the previous year) and adverse climatic conditions, according to the directors. In Hasanpur, the crushing season lasted 197 days as against 177 days previously. In both the factories, the quantity of cane crushed was more. In Hasanpur it was 25.17 lakh quintals as against 22.05 quintals during the previous season and in Sidhwalia it was 23.56 lakh quintals as against 18.85 lakh quintals.

Sugar production amounted more to 4,31,778 quintals against 3,95,730 quintals in the previous year with molasses recording an increase from 1,64,590 quintals to 2,22,211 quintals. Quantity of sugar sold also was more at 4,15,490 quintals compared to 3,35,253 quintals in the previous year, although molasses sale registered a drop from 1,90,567 quintals to 1,29,819 quintals. Closing stocks of both sugar and molasses were higher at 2,05,678 quintals and 1,67,870 quintals, respectively, against 1,89,390 quintals and 75,478 quintals in the previous year.

The factories paid a higher cane price of Rs 43.25 per quintal against Rs 41.50 per quintal in the previous year. This was more compared to the statutory price fixed by the state government of Rs 32.12 per quintal for the Hasanpur factory and Rs 29.36 per quintal for the Sidhwalia factory, as against the rates of Rs 27.60 and Rs 24.35 respectively for the two factories for the previous season. The price of levy sugar for the factories of Rs 634.92 was fixed on the basis of the BICP report and was more as compared to the rate of Rs 570.32 which was decided for the 1990-91 season. For the 1992-93 season, against the cane price fixed at Rs 27 per quintal linked to a base recovery of 8.5 per cent last year, the BICP has reportedly recommended a higher price. Sugar production by both the factories during 1992-93 season is likely to be more compared with 1991-92.

VULCAN ENGINEERING

Enhanced Design Capabilities

Vulcan Engineering's profits down the line have worked out higher for the year ended March 31, 1992 in the wake of much improved gross sales income of Rs 1,312 lakh compared to Rs 710 lakh for the previous year, coupled with increase in other income from Rs 198 lakh to Rs 231 lakh. The figure comprises, in addition to the usual 'other income' which amounted more at Rs 41 lakh against Rs 39 lakh previously, engineering, software and service charges received were Rs 112 lakh against Rs 56 lakh, and net work-in-progress in respect of turnkey projects was less at Rs 78 lakh against Rs 103 lakh. In line with the improved working, the company has declared a higher dividend of 18

per cent against 15 per cent for the previous year which covers a higher paid-up share capital of Rs 120 lakh against Rs 109 lakh following the conversion of debentures into equity on October 29, 1991. As the dividend was declared *pro rata* on the equity issued against debentures on conversion, the pay-out has gone up by a modest Rs 5 lakh from Rs 16 lakh to Rs 21 lakh. Profits appropriated to general reserve, on the other hand, have increased by Rs 21.50 lakh at Rs 35 lakh. Reserves and surplus, moreover, include now Rs 36.50 lakh under share premium account following the premium realised on equity on conversion of debentures compared to Rs 28.50 lakh in the previous year. Debenture redemption reserve has amounted to Rs 6.96 lakh against Rs 5.20 lakh in the previous year, while there is Rs 54 lakh under revaluation reserve against Rs 56 lakh in the previous year.

The directors state in their report that the company has been managing available funds to optimum levels so as almost entirely to eliminate dependence on banks and other lending institutions and minimise interest charges. At the end of the year the company had nil short-term loans, long-term loans were reduced from Rs 54 lakh to Rs 34 lakh, and interest charges for the year amounted less by Rs 3 lakh at Rs 9 lakh. And all this while operations progressed substantially.

The major turnkey project at Durgapur steel plant involving design, manufacture, erection and commissioning of a 900 tonnes per day lime calcination plant (the largest of its kind in India) for which an order was received from SAIL amounting to Rs 2,311 lakh was scheduled for completion in December 1992. Among other orders executed was a prestigious one for design and supply of equipment for an automated continuous steel strip plant coating line (first of its type in India) for Shree Precoated Steels. The company ended the year with orders of a value of Rs 4,650 lakh while it carried out itself substantial expansion and modernisation of its design and engineering capabilities enhancing these with computer design facilities. Having achieved a certain degree of expertise in computerised controls and automation for industrial processes, the company is ready to diversify and develop computer-related applications in the field of tele-communications. With its advanced design and manufacturing facilities for the steel, chemicals, glass and other thermal process industries coupled with capabilities for import substitution and of export potential, the company sees its future prospects as very bright.

An order worth Rs 286 lakh for export of a reheating furnace to Indonesia for a steel rolling mill was successfully completed during the year. An order for design and supply of equipment for an automated continuous steel strip galvanising plant to Mexico, amounting to over

Rs 200 lakh, is in advanced stage of execution with shipments started in July 1992. The company was expecting to finalise a Rs 400 lakh export order for a 120 tonnes per day capacity of lime kiln to Bhutan under World Bank credit. Export of design and engineering services especially to developed countries is of priority consideration while having set up a full-fledged export division, the company is planning to establish an export-oriented subsidiary abroad. Foreign exchange earnings during the year through export of design and engineering services amounted to Rs 39.93 lakh while the outflow mainly on royalty and foreign travel expenses totalled Rs 13.46 lakh.

At home the company received an order for design and supply of equipment for 600 tonnes per day annealing lehr for manufacture of float glass. This is based on a new technology developed and tailor-made by Stein Heurtey, France, and is the first plant to be installed in India utilising negligible amount of imports. Again, based on Stein Heurtey technology, the company has received a Rs 1,150 lakh orders from Lloyds Steel for design and supply of a 150 tonnes per hour walking beam slab reheating furnace for completion during the current year by manufacture almost entirely in India for the first time. This is a landmark achievement for the company.

MODELLA WOOLLENS

Starved of Finance

That the once famous wool top company, Modella Woollens, has gone sick is known. But what is worse is that even as a BIFR case it is not to be growing out of sickness. And this despite the scheme of rehabilitation sanctioned by the BIFR by its orders dated October 31, 1990 and April 15, 1991 having been accepted by Central Bank of India as the funding bank. Let alone funding which it did not provide by declining limited credit facility during the year ended March 31, 1992, Central Bank did not issue the 'no objection certificate' so as to enable the company to obtain working capital from other banks. Following the BIFR's sanctioning the scheme of rehabilitation, the company paid up the entire principal amount of Rs 1.18 crore to its bankers and agreed to pay a sum of Rs 38 lakh as interest on the principal amount at 6 per cent simple interest. While it kept its part of its commitment, because of the attitude of the bank, it was starved of finance to operate the plant viably. And even as it did function partially, the results were adverse. Significantly, there was some assets stripping as gross block declined from Rs 721 lakh to Rs 702 lakh, while losses eroded reserves from Rs 225 lakh to Rs 204 lakh, which is the amount represented now by revaluation reserve.

PANCHAYATI RAJ

Karnataka's New Step Backwards

K S Krishnaswamy

The enactment of the new Karnataka Panchayati Raj bill in replacement of the earlier Act of 1983 reveals not so much a commitment to progressive decentralisation as a unanimity among legislative members of all parties to strengthen their hold on panchayati raj institutions.

M Y GHORPADE, the Karnataka minister for rural development and panchayati raj, has these days the air of a person who has fulfilled a mission. He has succeeded in replacing the Karnataka Zilla Parishads, Taluk Panchayat Samithis, Mandal Panchayats and Nyaya Panchayats Act of 1983 by a new Karnataka Panchayat Raj Act of 1993, as required under the Constitution (72nd Amendment) Bill 1991 which has now been ratified by a sufficient number of state legislatures to become an effective Act. His efforts have, further, been symbolically applauded by the Congress Working Committee as a model for other states; and a special session of AICC(I) is to be held at the end of May to discuss this further. No wonder Ghorpade is pleased as punch with what he honestly believes to be a major step forward towards decentralised government.

Purely as a matter of political upmanship, there is little doubt that Ghorpade and Moiley, the chief minister, have won this round. Since his short tenure at the same ministry under Veerendra Patil three years back, Ghorpade had been wanting to 'improve' upon the late Abdul Nazir Sab's original statute on decentralised governance in Karnataka. The local government structure created under that statute was a remarkable experiment in devolving political and administrative authority to zilla parishads and mandal panchayats. Undoubtedly, there was plenty of room for further advance in that direction. But the 1983 Act had a clarity of purpose, viz., "promoting the development of democratic institutions and securing a greater measure of participation by the people in the said plans and in local and governmental affairs" (italics added). With this objective in view, its structure and details were built around three basic principles of democracy—(i) that sovereignty vests ultimately with the people who elect the 'government', (ii) that those elected representatives who constitute the government of the day are accountable to the people, and (iii) that no outside functionary, elected or otherwise, has any authority in the area assigned under the Constitution or statutes in force

to the "local government". In the 1983 Act, only some of the developmental functions had been devolved to zilla parishads and mandal panchayats; but the promise existed of a progressive transference of the full responsibility of governance—the legislative, executive and judicial functions as applicable to the area under their jurisdiction—to the panchayati raj institutions.

But Ghorpade's new bill marks no advance in any of these respects. Its purpose has in fact been quite different from the very start; and that purpose consisted of ensuring proper control over the functioning of zilla parishads and other panchayat raj institutions. Several of the new regulations in the bill are justified by him as necessary for preventing misuse and misappropriation of funds by individuals elected to office in these local bodies. In addition to tightening the control measures for these purposes, the new bill converts the two-tier system of zilla parishads and mandal panchayats in the 1983 Act into a three-tier set of panchayat raj institutions at the district, taluk and village levels as envisaged in the Constitution (72nd Amendment) Act of this year. The area of operation of the local bodies remains limited as before to development schemes and programmes. All other governmental functions remain with the state government, which will now operate much more openly through its civil servants as a monitoring authority.

When more than two years ago, the late B Basavalingappa and Ghorpade as ministers in charge of panchayat raj in Veerendra Patil's government decided to modify the 1983 Act drastically, they at least had thrown open the subject for general discussion. But this time Ghorpade held everything close to his chest and revealed the full measure of his 'reforms' only at the stage of introducing the bill in the Karnataka legislative assembly at its last session. With its absolute majority in the assembly, the Congress government had no difficulty in securing the passage of the bill. But the Congress Party does not enjoy such control of the legislative council, where the combined opposition could have defeated

the amendment. When things appeared as if the bill would be voted down, the chief minister and his minister for panchayat raj got the leaders of the opposition to a special breakfast meeting at which a deal was struck. The deal was that if the opposition helped the ruling party and passed the amending bill now, the Congress Party assured that it would incorporate later on any amendment to the new legislation which would strengthen the process of decentralisation. This assurance, according to the leader of the Janata Dal in the council who is also the leader of the opposition, had been given by the chief minister in the presence of some of his other colleagues and the leaders of other opposition parties!

This entire episode reveals in essence not so much a commitment to progressive decentralisation as a unanimity amongst legislative members of all parties to strengthen their hold on sub-state organisations. It is astonishing that the leaders of the Janata Dal in the two houses of the Karnataka legislature have become a party to the new bill on nothing more than 'an assurance' given by the chief minister and his colleagues at a private conclave over breakfast. If the government intended seriously to fulfil its assurance, such a private understanding should have been formalised by a full statement by the minister in the legislature, specifying the particular amendments to the new legislation which the government had undertaken to carry out after the passage of the bill. There is so far no press report of such a statement by the minister, let alone a press release by the ministry of rural development and panchayat raj to inform the public. A major adjustment in the political structure within the state is not just a matter for the legislators to arrange as convenient to them; it is *par excellence* a matter for public discussion and electoral decision. By treating a matter of such vital importance to the people as something to be settled in a mutually advantageous manner over a cup of tea is worthy neither of the chief minister nor, especially, of the leader of the opposition. It is probably a good business-like way of doing things; but it certainly is not democracy.

Equally worrying are the implications of the new bill. By enlarging the role of the panchayat at the taluk level, and by making the M.L.A. from that constituency the chairman of that panchayat, it has destroyed one of the main purposes of the earlier Act—namely, to enable the local electorate to identify government with the zilla parishads and the mandal panchayats. Similarly in the name of ensuring proper control over village panchayats, local bodies at the taluk and district levels have been assigned monitoring powers over village panchayats which often tend

to be exercised by civil servants in the name of the governments they serve. The chief secretary of the zilla parishad and the deputy commissioner are now required to report directly to the state government. While in the case of the deputy commissioner this has always been the case, the 1983 Act had taken care to ensure (a) that the chief secretary was accountable to the zilla parishad and (b) that he would be senior in rank to the deputy commissioner, so that it would be possible for him to obtain any reports he required directly from the deputy commissioner.

The new bill changes all of this. By reinstating the MLA at the taluk level and giving him greater authority over village panchayats, the principle that village panchayats are accountable to the local electorate and not anybody else is diluted if not totally lost. Secondly, by enlarging the role of MLAs in local bodies at all levels, it reduces the importance of the zilla parishad 'adhyakshas' and other elected functionaries. By changing the status and responsibilities of the chief secretary, the new bill obscures the clarity that should exist between local government officers and state government officers. This has been a considerable problem since the start of the panchayat raj system in 1987; but instead of going further in the direction originally indicated—namely, converting after a period deputation of staff from state cadres to local authorities to increasing the scope for direct appointment of their officers and other staff by local bodies—the present bill is retrograde. With the passage of the new bill, a basic principle that is important in any federal structure, namely, that a person elected to the legislature of government at one tier cannot at the same time and on the basis of the same election be a full member of another elective body, is completely lost. The objective that the new bill fully achieves on the other hand is to restore completely the power and the patronage of the MLAs in their constituencies, which they have all along felt is threatened by the growth of panchayat raj institutions. Ghorpade and the leaders of the opposition parties in the Karnataka legislature have thus achieved a common objective for themselves and their members; the new bill in no way diminishes their authority through decentralised government, notwithstanding whatever Ghorpade says or assures.

Indeed it is highly questionable if the intent of the 72nd Amendment is really the creation of a decentralised polity in India. That amendment, which differs from the late Rajiv Gandhi's infructuous 64th Amendment only cosmetically, is more likely to become an instrument of strengthening the power of the central ministries at the local level via the rules and regulations that apply to development activities. It is not accidental that in the 1993-94 budget, the largest increase in the transfer of resources from the centre to the state plans is under centrally-sponsored

THE TATA IRON AND STEEL COMPANY LIMITED

NOTICE

Notice is hereby given under Section 154 of the Companies Act, 1956 that the Register of Members of the Company will be closed from Tuesday, 15th June 1993 to Tuesday, 6th July 1993 (both days inclusive) for the purpose of payment of dividends for the year ended 31st March 1993, when sanctioned.

The Transfer Books of the Company will also remain closed for the aforesaid period.

Notice is also hereby given that the dividends for the year ended 31st March 1993, when sanctioned, will be made payable to those shareholders whose names stand on the Register of Members of the Company on Tuesday, 6th July 1993.

No tax at source will be deducted if the dividend payable to a shareholder does not exceed Rs 2,500/-. Other members whose income is below the taxable limit and who desire to get their dividend without deduction of tax may file a declaration in Form 15G, in duplicate, before Tuesday, 15th June 1993 with the Company's Registrars:-

Tata Share Registry Limited,
Army & Navy Building,
148, Mahatma Gandhi Road,
Bombay 400 001.

Dated this 27th day of April 1993.

By Order of the Board of Directors

(Y. M. Bhangle)
COMPANY SECRETARY

Registered Office:

Bombay House,
24, Homi Mody Street,
Fort, Bombay 400 001.

schemes. The argument used by the centre in defence of this is precisely the same that Ghorpade uses in the case of the local governments, that is to say, to prevent misuse and misappropriation by certain individuals at the state-level. When one puts all these together, it is not accidental that the Congress Working Committee should consider the latest Karnataka bill as a model to be recommended to the other states. And it is symbolic that the full dress convention on this 'march towards decentralisation' should be held

at Amethi next month.

There is perhaps a 'covert purpose' also. The Karnataka government is under Supreme Court orders to hold panchayat raj elections before the end of June 1993, and nothing has so far been done to fulfil that obligation. Apparently, the breakfast assurance of Moily's government has been given under duress: it badly needs a fig-leaf to avoid being hauled up for contempt of court when it appears before the Supreme Court next June. Is the new bill, then, basically that fig-leaf?

plead for afforestation of the Himalayas as a sustainable solution to the flood problem of the vast plains in northern and eastern Indian subcontinent. Little wonder, then, that the report has been coldly received by environmentalist groups. Before long, a critique of the CSE volume too would emerge, in the process enriching the literature in this area. This is an inevitable paradigm of advancement in the research world. Therefore, the CSE ought to take the criticism, bitter or otherwise, in its stride.²

The second observation pertains to the CSE announcement about the contents of its future reports on the nation's environment. "We now find that completed chapters go out of date even before we reach half the book. The result is an unending chase to document changing events in an ambitious attempt to produce a comprehensive report... Having gone through a difficult experience over the last five years to produce the third report, chasing events which continue to move with considerable rapidity, we have now decided to publish the third report not as a comprehensive report but as a series of reports on specific issues." The present one on floods is, therefore, the first of this new series.

For an organisation to "move away from journalism into policy research" is a radical transformation, requiring in the first place a sea change in the mindset. Among other things, it demands both patience and perseverance in probing something akin to 'art for art's sake'. It requires a curb on the craving to publicise paradoxical discoveries, striking discrepancies in data base, glaring contradictions, etc, so as to attract public attention. Furthermore, requirements of quality research poses the problem of creating an in-house expertise of specialists in diverse disciplines. Without requisite financial support on a durable basis, not to mention still scarcer resource persons, the quality of research and the substantive content of the subsequent reports may be difficult to ensure. Too much dependence on short-run project support from outside agencies and on outside experts has its own perils.

It would appear that the CSE has largely opted for the latter course in bringing out the present research report. This is suggested by the numerous contributors listed at the place that carries the authors' names. Twenty-six names from the Gangetic-Brahmaputra basins are listed for the concrete inputs supplied by them. ("This report would not have been possible without the support of....") Anil Agarwal and Ajit Chak did both the co-ordination and editing work, and the writing of the report has been done by Anil Agarwal, Neeraj Labh and V A Nambi with the help of additional contributions from Mukul Sharma, Ajit Chak and Sangeeta Synghal. To make a sensible amalgam out of diverse contributions is a hazardous task, more so in the

Coping with Floods in Himalayan Rivers

B D Dhawan

THE Centre for Science and Environment's third Citizens' Report on the state of India's environment titled Floods, Flood Plains and Environmental Myths has sought to question the view, vigorously propagated by environmentalists, that afforestation of the Himalayas is the sustainable solution to the problem of floods in the northern and eastern plains of the Indian subcontinent.

INDIA is a country of such continental diversity that one can form contrary impressions or opinions about any of its major characteristics. When a periodic drought occurs, a feeling that nature has been too niggardly in the matter of water endowment comes to many of us. As news of flood havoc in years of excessive rainfall pours in, we begin feeling a sense of tyranny of our water bounty. In between these fluctuating moods, we get occasionally baffled by the seemingly paradoxical phenomenon of simultaneous occurrence of drought and flood in the same calendar year, sometimes in the same state!

It is these extreme oscillations in natural phenomena that give rise to the pertinent question: why cannot the government undertake major water conservation measures, whereby surplus flood waters get effectively stored up, to be used later either in rainless months of the year, or carried over to subsequent years to cope with drought in the main monsoon season? Another related question is: why can't we harness the huge surplus waters of our highly flood-prone eastern Indo-Gangetic plains, presently flowing to the Bay of Bengal, so as to relieve *inter alia* the great natural water scarcity in the drought-prone tracts of the western and southern parts of the country? Though these two questions have not been squarely answered in the third Citizens' Report on the state of India's environment entitled *Floods, Flood Plains and Environmental Myths*,¹ released recently by the Centre for Science and Environment (CSE), New Delhi, yet one can conclude that the CSE's answers to these questions are primarily in the negative. For, its cen-

tral message for the nation is that it must learn to cope with the periodic flood hazard. In point of fact, the authors are so overwhelmed by their stunning research findings that they dedicate the report to the people who have learnt over the ages the art of living with floods.

CSE'S ROLE

Before elaborating the contents of this signal contribution to Indian research literature on floods, some observations about the CSE itself are necessary. First, the prefatory remarks of the series editors, Anil Agarwal and Sunita Narain, announce the CSE's decision to now transform itself from essentially a compiler-cum-diffuser of ongoing transformations on Indian environment to a policy research body.

It is possibly this change that has emboldened the authors to live up to the image of a researcher, namely, to tell the truth as he discovers it through painstaking research endeavours without fear of upsetting holders of contrary views, however numerous they be. No wonder, this report has caused much dismay and disbelief among those who have for long believed in the 'sponge effect' of forests in eradicating the flood menace. 'Dam the Himalayas with forest cover, not with engineering dams' has indeed been one of the main slogans of those who are opposed to the idea of big dams in the Himalayas, as also elsewhere in the country as well as in the world as a whole. To put it bluntly, the CSE has shown that environmentalists and the Indian media supporting them have been propagating a sheer environmental myth when they

research world. To guard against the risks of misperceptions, misplaced emphasis, or outright mis-reporting (these risks are unduly high while dealing with an immensely complex resource like water), the CSE might have held a seminar to which select flood water experts (more so from the government bodies which figure adversely in the report) could be invited. The need for this kind of filtration of a compounded research document prior to its publication is all the greater because CSE's reports tend to be read widely and quoted avidly but uncritically, more so by those who happen to be outside the academic portals. This poses the danger that some of its own weak/soft conclusions might become a source of new half-truths, if not outright myths. Let me concretise this point with a pertinent example.

On flood damages, the authors have assiduously compiled yearwise statistics for the period 1953-87, giving the mean value of damage per year plus the maximum value for the worst year. Since they do not adjust for the persistent price inflation that occurred in this period—something that is so routinely done in applied economic research—the entire analysis gets distorted. Assuming that the Indian rupee depreciated to ten paise between the 50s and the 80s, the extent of rise in the value of flood damage would be nearly four-fold, not forty-fold. Because of this neglect of inflation factor, the computation of the mean value of damage per year and the identification of the worst year of flood damage become misleading exercises. Without price adjustment, it is open to question whether the incidence of flood damage is rising over time.¹

DEFORESTATION NOT THE PROBLEM

This illustrative criticism is not to detract from the central proposition of this report that is reproduced below in the authors' own cautious wording:

Floods in the plains below the vast Himalayan ranges may not be greatly exacerbated by deforestation. Floods are, in fact, and will remain, an inherent feature of these plains whether the Himalayan mountains are well clad with a green cover or whether they are deforested and barren. The Himalayan mountains constitute an extremely fragile ecological system. They are the youngest mountains of the world and, therefore, highly erodible. They are lashed by rainstorms of an intensity that probably no other mountain system faces. They are extremely seismic, periodically witnessing some of the world's worst earthquakes. Water and silt, therefore, move out of these mountains in explosive waves. Floods and shifting of river courses is, therefore, inevitable.

Deforestation can aggravate the problem but afforestation cannot get rid of it. Now this may not be true with other flood plains with different watershed

characteristics, hydrological conditions, rainfall parameters and other ecological characteristics. In fact, the information presented in this report leads us to the inevitable conclusion that the societal susceptibility to the flood problem in the Indo-Gangetic plains has increased more because of the enormous social and ecological changes that have taken place in the flood plains than the changes that have taken place in the higher reaches of the Himalayan watersheds (p vi, emphasis added).

So what has been amiss (a) with our earlier faith or belief in the role of forests in averting floods, and (b) in our ongoing planning of building multipurpose dams and network of embankments along rivers for containing the periodic floods? The authors provide cogent and convincing arguments/evidence on the futility of constructing river embankments and covering Himalayan slopes with forest cover as protection against the ravages of Himalayan rivers. The same, however, cannot be said categorically about their negative perceptions about the utility of big storage reservoirs in flood proofing task. Before dwelling on this debatable point, let us grasp the argument as to why the sponge effect of the forests fails to work out fully in the case of the Himalayan rivers.² Since there is nothing new or novel about the other argument about the ultimate futility of embankments in the case of rivers with large silt load and volatile fluctuations in day-to-day flows, this aspect needs no more than a passing reference in what follows.

Though rainfall, in the ultimate analysis, is the source of water flows of a river, yet analytically it is useful to distinguish different components of such flows. One component is the 'base' flow which is a sort of minimal flow that is often seen in a river despite the absence of any current rainfall precipitation in the catchment area. This flow originates from some natural storage bodies in the river catchment. Two such noteworthy storage bodies are snow mountains and water held underneath in the soils, including soft rocks and the crevices/cracks of hard rocks. Snow melt and water discharge from groundwater table into a river are the two principal sources of the base flow, which does vary depending *inter alia* upon solar activity and the height of groundwater table above the river bed. Snow melt tends to peak during summer season precisely when groundwater component of the base flow tends to be minimum.

CRITICAL FACTORS

Occasional breaches³ in natural lakes formed by landslides blocking the course of a river in its upper reaches with high gradients lead to additions to the base flow. If such a breach is in the nature of a dam burst, it can lead to flash floods in the upper reaches. But most common-

ly flood in the lower plains of a river basin results from surface water runoff in the wake of a downpour. As this rainfall runoff gets superimposed on the base flow (about 15 to 20 per cent of the mean annual flow), the river swells in size, the extent of swelling depending on the volume and intensity of the runoff water which in turn depend on three distinct factors: (1) quantity, intensity and simultaneity of rainfall, (2) the slope or gradient of the land mass and the relative share of mountainous catchment, and (3) soil depth and soil cover, especially on the hillsides.

Needless to say, these three factors (as also some less important factors not mentioned here) have an interacting impact on the runoff. Thus a rainfall of high intensity (given the same slope of land and soil depth) would still generate lesser runoff when the land is well covered with trees and grasses which blunt the force with which rain drops strike the ground, thereby facilitating its infiltration into the soil. However, the depth of the soil and the porous space within it determine how much (infiltrated) water would get stored up in the soil. Once this storage limit is reached, the subsequent rainfall must wholly runoff to the river channel down below, irrespective of the extent of the forest cover. From this point onwards, forests, bushes, grasses and other vegetation no more impede the water runoff phenomenon. Such flora, however, do continue to impede the other runoff phenomenon, namely, soil erosion from land surface, better known as *sheet erosion* which has to be distinguished from other kind of soil erosion, such as *hillsides toppling over* in the shape of big land slips or landslides that block, partially or wholly, stream channels.

It is this thickness (and porosity) of the weathered soil on the mountainous slopes that essentially determines how much of the rainfall will be stored up ('dammed up' in Sunder Lal Bahuguna's terminology) in the upper, hilly catchments of a river basin. Thus the sponge effect of vegetative cover tends to diminish as one moves up a hillside because depth of soil diminishes from bottom valley to the hill top. Likewise, the sponge effect tends to be inversely related to amount of rainfall. In other words, afforestation or integrated watershed management programme is likely to prove *ceteris paribus* much more effective in conserving water *in situ* in low rather than high rainfall, hilly terrains.⁴ It is this perception or experience about low rainfall tracts that has probably sustained the widely-held view of forests functioning everywhere or universally as sponges for absorbing rainfall which would otherwise end up as floods in the valleys and the plains down below.

In passing, it may be pointed out that runoff of surface water can occur even before the porous space is fully saturated with infiltrated rain water. The likelihood

phenomenon is all the more when intensity of rainfall is high, that is to say, when rainfall drops come in intense succession in a short span of time. When this intensity is low, rainfall infiltration occurs in a smooth fashion. That is to say, infiltrated water, pulled by the force of earth's gravity, has enough time to travel inside the porous voids of the weather mantle of the earth.

Not only the rainfall but also geologic conditions of the Himalayas are unfavourable for effectively arresting, through afforestation, the soil as well as water erosion. True, the storage space for rain water here at places is often unusually large owing to much less compaction of soils having occurred in the Himalayas. But this looseness of soil militates against the stability of the hillsides once these get impregnated with infiltrated water inside their bodies or bowels. In the absence of solid, rocky walls to hold back such stored waters, two things happen. First, subsurface runoff occurs in a big way, carrying with it both the infiltrated water and the loose soil. That is to say, we have a case of leaky storage, the leaks becoming gushing muddy subterranean channels owing to the force of earth's gravity, ending up finally into surface streams at the valley floor.⁸ Second, the phenomenon of landslides and toppling of hillsides into surface streams is hastened by the inner movements of silt/debris-laden water. So the more we promote rainfall infiltration via vegetative covering of the hillsides, the greater the danger of landslides toppling, more so in a seismically active region like the Himalayas.

The authors of the report underscore the surface hydrology, geology and hydrogeology of the Himalayas in order to bring home the following crucial point. "Landslides contribute more to soil loss in the Himalaya than surface erosion. Deforestation is often blamed for landslides, but forests can only inhibit shallow landslides. They have little effect on deep landslides" (p 40). When heavy rainfall over a two- or three-day period occurs, there is neither enough time for infiltration of rain water into the soils nor is there enough soil depth in hills to store such huge quantities of water even in geologically compacted mountains. Storing 82 cm of rain—norm of September 18, 1980 (as occurred, according to the report, in central Himalaya over a two-day duration with its centre at Nagina in Bijnor district of Uttar Pradesh) requires 4 to 5 metres thick *dry soil* which is almost an impossibility at the fag end of a monsoon season.⁹ No wonder, such intense rainstorms produce devastating swelling in river flows. For instance, the three-day rainstorm of late September of 1924 in the western Himalayas (Simla-Kumaon hills) gave rise to the following consequences:

The Yamuna catchment up to Tajewala received heavy rains during the first two

days. A peak discharge of 14,000 cumecs (about half lakh cusecs) passed down Tajewala headworks on September 28 and 22 km upstream the Yamuna at Paonta rose by 13.1 m (about 45 feet) on the same day. Four days later, on October 2, the water level rose by 0.94 m above the danger level at Delhi railway bridge. Hundreds of people and thousands of head of cattle were washed away in Dehradun, Saharanpur, Ambala and Karnal districts (p 33, box item titled 'Rains of Terror').

WHY NOT STORAGE RESERVOIRS?

We might rightly ask at this stage: why not create man-made storage reservoirs to hold back the flood waters? This is indeed a sensible idea, which has been not well explored in the report. There are techno-economic limits to this option.¹⁰ First, rivers cannot be dammed usefully once these have emerged from the hills onto the flat or deltaic plains. Low height dams here do not create any worthwhile storage of flood waters in high rainfall basins. On the other hand, construction of high dams here would submerge very large tracts of valuable land with many human settlements. Roughly speaking, each hectare of land area benefited with irrigation from such stored waters would mean another productive hectare of land going under the reservoir, not to mention the large-scale uprooting of masses on these high density lands. It is only in the hilly portion of a river basin that the ratio of submerged land to benefited land can be kept at tolerably low levels. Typically, a big dam in India submerges land equal to 5 to 10 per cent of the benefited land, whereas a small dam, like the ones used in south India for tank irrigation, submerges area equal to 15 to 20 per cent of the land it benefits.

Second, dam sites for erecting big dams are naturally rather scarce. Because of this scarcity dam engineers are tempted to build mega dams on a few dam sites identified through survey and investigation work in a river basin. However, this temptation is greatly tempered by technical parameters (rock geology, hydrology, meteorology, soil characteristics, etc) on the one hand and socio-economic factors on the other. If a dam site can sustain a huge reservoir both technically and socio-economically, why not build one to have the maximum multipurpose benefits of flood control, hydel power generation, irrigation, water for industrial and municipal uses, etc? The Hoover dam on the mighty Colorado river in the US is a good example of such a mega reservoir that can store *three times* the normal or average annual flow of that river. This widely acclaimed feat of American engineering of the 20th century¹¹ effectively stores up most of the above-normal flood waters, as do most other big American dams which are designed with

storages far higher than the mean annual flows of their rivers.¹² Such dams truly 'kill' a river in the words of Baba Amte, the veteran opponent of the big dam idea on the sacred Narmada river, that is to say, these mega dams fully harness river water resources for economic prosperity, allowing little loss of river water to the seas.

In contrast, few Indian reservoirs are so designed. These are mostly designed on '75 per cent dependability' basis, whereby their storage is inherently incapable of impounding any above-normal inflows into them. Owing to this, their managers are forced to let out such excess inflows through the dam spillway system, only to be berated in public fora for aggravating the flood problem instead of controlling it. The authors of the study under review too harbour such misgivings, writing as they do in bold letters on the billboard page preceding each chapter the categorical sentence that "dams have become an important cause of floods" (page before chapter 1).¹³ In what follows the Damodar Valley (DVC) case is taken up for an instructive analysis of why dams can occasionally aggravate the flood menace in the Indian conditions.

DVC EXPERIENCE

The DVC project, consisting of a few big dams and a strong component of soil and water conservation programme in the upper erodible reaches of the Damodar river basin, is patterned after the famed, multipurpose Tennessee Valley project (TVA) of the US, with flood control as one express objective, to achieve which a part of the storage behind dams is *exclusively earmarked* for flood water storage. With such an allocation of storage capacity, the conflict between economic uses (irrigation, power generation and navigation) and flood control gets eliminated. But unfortunately the DVC management has not been allowed to use this earmarked storage. Why? Because the state administrations of this inter-state project have been unsuccessful in fully completing the task of shifting many of the dam oustees from the reservoir areas. These unshifted oustee villages, located at higher elevation in the catchment area, would be submerged in the reservoirs if the reservoirs are filled up to the full dam heights. As a result, excess inflows in years of exceptional rainfall (in amount as well as time of the year) have perforce to be let out, though these can be impounded provided the DVC management is enabled to utilise the hitherto *unutilised* flood storage capacity of its system. This brings us to the pertinent question as to why the state administrations, under the aegis of the state politicians, fail to carry out the eviction task as per the original project plans. Thus we come face to face with the socio-economic factors that have a great bearing on the decision about the size of a big dam to be built on a given dam site.

When population density is low, land (including forest land) resource is plentiful in relation to population resource. In such favourable resource endowment, costs on account of land submergence and the resultant dislocation of human populations by big reservoirs tend to be low. For instance, in the US some reservoir sites were totally bereft of human settlements, as in the case of the Hoover dam, the highest dam in the world (till the construction of Naurek dam in the former Soviet Union). In other sites, the unfortunate dislocated people could be easily relocated on a land-for-land basis and that too very near their original places of habitation. It is thus not surprising that mega dams, with storages capable of impounding even exceptionally high inflows, are the order of the day in the US.

But these circumstances do not prevail in densely populated nations like India where the number of dam-disrupted persons is usually sizeable and convenient alternative locations for their rehabilitation practically non-existent. As a result, these persons are very adversely affected by the development of dam-based irrigation/power projects. Hence one encounters widespread opposition to the proposed big dams on mighty rivers like the Ganga and the Narmada. In a way, this opposition brings poignantly home the meaning of the great rider on cost-benefit analysis, namely, whose costs and whose benefits?

Economic theory offers no satisfactory solution to this intractable problem; economists here offer mere sops in the form of financial compensation to the dam oustees. As the ability to handle finance of the low-educated people living in great isolation from the mainstream is fragile, they are, by and large, unable to restart life once they are uprooted from their original environs.¹⁴ This is one inhuman face of the development process that has dismayed many a sensitive soul.

In an engineer's calculus of the height of a dam, the benefits of a multipurpose dam *ceteris paribus* increase much faster than the proportionate rise in the dam height almost in an accelerated manner (i.e., the relationship is non-linear, probably quadratic).¹⁵ But so is the relationship between land submergence/number of affected persons and the dam height. Thus, the more the multifarious benefits we attempt to confer on villages and towns on the *downstream side* of a dam, the higher become the costs of submergence and dislocation on the *upstream side* of the dam. It is a well known geographical fact that the density of population, when already high, tends to rise as one moves away from the *flood zone* of a river basin. This crucial factor militates strongly against Indian dam-builders desire to emulate their American counterparts in building mega reservoirs, each with a storage capacity well above the annual flow in a river. The DVC failure to utilise the flood storage spaces in its

dam is to be understood in this aforesaid social milieu of the country

DAMS AND FLOODS

Let us return to the issue of dams being a cause also of floods. As a multipurpose dam comes up on a river in a given region an impression goes round that floods would become a thing of the past on downstream side of that dam. The impression is fostered both by the engineering fraternity and the regional politicians, irrespective of whether flood control is a specific objective in building the dam. This encourages land-hungry populations to begin settling down in the *flood zone* area of a river basin.

Even when there is no express provision for storing flood waters in the reservoir, the extent of which a *part* of the flood waters originating on the upstream side of the dam are held back in the reservoir for irrigation and hydel generation, it reduces the flows to the downstream plains, thereby reducing the area of flood zone. But people moving into the flood zone for settling down permanently have no idea where exactly the new boundary of the diminished flood zone lies. The resource-poor among them, and more so those who are already eking out a precarious living out of the *khadar* lands of a river, tend to overspill, knowingly or unknowingly, into the newly defined (but undelineated by any government agency) flood zone area. These people suffer not only in the event of even a normal flood in the river, but most devastatingly (in life, cattle, standing crops, assets, etc) from an exceptional flood. The situation is best summed up by the proverbial saying: deed has in it the seed of destruction. The partial security against floods afforded by a dam becomes a means of destruction for the unwary.

This spillover or encroachment into the flood zone of rivers, especially in the Gangetic plains, has been occurring ever since the density of population has been rising inexorably. It is this population-pressure-related encroachment of the flood zones that is the root cause of rising flood-related losses (even when nominal values are adjusted for price inflation) in India.¹⁶ Disaster management experts in general and Indian geographers in particular have been urging the centre in vain, time and again, to enact flood zoning laws. Can governments meaningfully enforce such laws in the face of a burgeoning population for which opportunities for gainful absorption are lacking in both agricultural and non-agricultural occupations outside the flood zones?

Because of our socio-economic compulsions we cannot build mega dams that can truly hold back both the exceptionally high water inflows and vast quantities of silt and debris following the occurrence of intense rainstorms at the *far end* of the monsoon season. With extra storage for water as well as for silt and debris, the

multipurpose mega dams provide not only surer and greater economic benefits but also provide these on a far more sustainable basis. We have perforce to do without such mega dams. As a matter of fact, we actually need to scale down a bit the heights of our planned dams, so as to keep the serious problem of dam oustees within manageable limits. Such scaled-down dams would still remain big dams but with substantially reduced economic benefits and flood prevention role. Even so, these could help in combating the flood menace to some extent. In point of fact, the administrative back-up needed for the recommended CSE option of living with the floods in the Himalayan river plains would be much more exacting without (a) some big dams, (b) selected afforestation programmes, (c) massive integrated watershed programmes and (d) selective embankment and river training investments. Without the component (a), living with floods would be horrid. Therefore, we need to look afresh at the CSE-ruled out option of big dams in the Himalayas, without over-reacting to the seismic hazard posed by such dams.

Notes

- 1 It is available, both in paper back (Rs 150) and hard bound (Rs 350), from the CSE.
- 2 A telephonic conversation with Anil Agarwal on April 22, 1992 (after he had been sent the first draft of this paper three weeks earlier) revealed that he was quite exercised over the criticism of the report, more so from Vandana Shiva and N D Jayal. I have seen only the review by Jayal in *India Today*, and did not appreciate his high-minded advice that such reports would weaken the environmental movement. Jayal's own body, INTACH, has not always advanced the cause of truth. Its own two anti-big dam studies, under the authorship of Vijay Paranjpye, are full of half-truths, not to mention their weak analytical content on economic points. For more details, see my reviews of these (*EPW*, August 31, 1991 and *Journal of the Indian School of Political Economy*, Vol 4, No 1, January-March, 1992).
- 3 This illustration be better taken as a response to editors' solicitation that "comments, as before, would always be welcome".
- 4 The exposition from now onwards is based on the reviewer's own understanding, now and then reinforced with data from the CSE report.
- 5 These breaches usually occur at the point of confluence of two tributaries of a stream. At this point the process of sedimentation gathers strength because of slowdown in the pace of the smaller of the two tributary.
- 6 By 'in situ' conservation the connotation is that water is stored near about the place where rain drops fall on the ground. Water conservation, however, has a broader usage that includes water harvesting (in farm ponds or in large metallic containers), and construction of percolation tanks, irrigation tanks, diversion works, major reservoirs, etc.
- 7 The speed of this infiltrated water is very low, more so in sticky or clayey soils.
- 8 Those who have visited the famed Sukhomajri watershed near Chandigarh

might have observed land subsidence near the edges of the watershed. Such subsidence is due to heavy soil erosion underneath the land, where subsurface water channels remove a great deal of soil too.

- 9 The monsoon normally ends by the middle of September. It was such a post-monsoon storm in the Bhakra catchment that created havoc in 1988 in part of the Punjab plains falling in the Sutlej basin. For more details, see p 12 of the report.
- 10 The expository write up from this point onwards is once again this reviewer's handiwork.
- 11 For an excellent, highly readable account, see Joseph E Stevens' *Hoover Dam: An American Adventure* (University of Oklahoma Press, Norman and London, 1988).
- 12 For half a dozen dams each in the US and India, Z Hasan gave ratios of storage to mean annual inflow, while presenting his paper on Surface Water (jointly with R S Prasad and O K Rao) at the Third National Water Convention at Nagpur, February 5 and 6, 1992.
- 13 Later in the chapter they conclude on a less unacceptable note when they state that "the Indian experience, therefore, shows that dams are only a mixed blessing as far as flood control is concerned" (p 13). No less

interestingly they cite instance of dam burst for all categories of dams: the big dam at Mutha (Maharashtra), the medium dam at Morvi (Gujarat) and a small dam at Gopinatham (Karnataka).

- 14 Sometimes, tribal forest dwellers among the uprooted people in India have been resettled in other forested tracts so as to minimise for them the hardship of restarting life in dissimilar environs. Since the forest cover of the nation too is already below the needed level, the option of relocating tribal populations in suitable habitat has become very problematic.
- 15 Some of the Narmada Bachao Andolan activities are lately veering round to the view that heights of Narmada dams can be reduced, a point also commended by this reviewer to water planners for the last two years. But they are incorrect when they assert that lowering of the Nargam dam by 15 per cent, from 455 to 388 feet, would not materially affect Gujarat's irrigation benefits from this dam.
- 16 Reported statistics on the value of economic losses from natural disasters need to be taken with a pinch of salt because states have been increasingly inflating such losses, so as to get more central assistance which has become now an important source for meeting the budget deficits.

statutory pre-emptions. Despite these and other limitations, some of which have been corrected by appropriate modifications, the exercise may be useful in understanding the profitability of branches in rural areas as compared to those in other areas.

As the figures of working funds of branches at urban/metropolitan centres are somewhat inflated by large institu-

BANKS

Myth of Non-Viability of Rural Branches

Analyst

Dissection of the profitability of the branches of a nationalised bank shows that there is nothing inherently non-viable about banking in rural areas. The much-talked-about losses of banks' rural branches, when they do actually occur, are to be attributed to the incompetence of individual banks' managements.

ONE frequently hears that rural branches of banks, with low volumes of deposits and advances, and the latter at low interest rates to priority sectors, are financially non-viable and eat into the profits made by branches at other centres. Therefore, to improve the profitability of commercial banks it is often suggested that rural branches should be delinked from commercial banks either by forming subsidiaries or by creating a separate All-India Rural Bank. Against this background, it is useful to analyse the profitability of the branches of a nationalised bank grouped according to the population of centres served.

The bank in question had over 2,000 branches of which 56.5 per cent were in rural areas covering both agriculturally developed and backward states. The per branch deposits and advances of the bank in rural areas were higher than those of all public sector banks, by 20 per cent and 25 per cent respectively. This bank may not be representative of the banking industry, but its experience throws light on

the potential profitability of rural branches if properly managed.

The basic data for the accounting year 1991-92 were taken from the annual balance sheet and profit and loss statement of the branches. As the branch data include inter-branch transactions, the sum of the working funds of branches exceeded that of the bank as a whole by 11 per cent. Similarly, the sum of the gross profit made by branches exceeded that of the bank as a whole because transfer payments to branches exceeded the income of head office from deployment of funds in

tional deposits at the year-end, we have also worked out the ratio with reference to the average of working funds as at the end of March 1991 and March 1992 for each population group. Table 1 gives the share of each population group in the total working funds and branch profits and also the ratio of profit to working funds, both year-end and average. The table shows that rural branches are the most profitable, whether profitability is worked out with reference to year-end working funds or average of two-year figures. The average figures substantially improved the profitability ratio of metro branches, making them second only to rural branches. Despite this correction, some distortions remain to be corrected to get a true picture.

Two major sectors contributing to the interest earnings and expenses are transactions with customers and transactions with head office. Interest charged on advances and paid on deposits constitute customer-related interest and is shown in Table 2. While interpreting this table it may be kept in mind that interest received/paid is for business throughout the year while figures for advances/deposits are as on last day of the year 1991-92. Since last-day figures are normally inflated, the rates of interest worked out by us are likely to be somewhat lower than the actual and especially so in urban and metro areas where the quantum of year-end spurt in both deposits and advances is substantial. It may also be pointed out here that urban and metro branches may be having a higher proportion of non-performing advances and to this extent the interest received would be proportionately low.

As per Table 2, rural branches earned the highest interest rate on advances (12.77 per cent) with metro branches coming next (12.35 per cent), followed by urban and semi-urban branches. One would expect return on advances to be the highest in metro centres and lowest in rural branches. It seems that relatively low year-end figures and low non-performing advances in rural areas are the main causes of the above pattern of spread.

Metro branches had the lowest interest cost of deposits, as a result of which they had the highest spread (margin) between the interest rates on advances and on deposits. Urban branches had the lowest spread between the two rates mainly due to the inordinately high cost of deposits.

Interest payments from/to head office (HO) are the other major source of income/expenditure of branches. In this area, there is an important distortion related to interest income/expenditure. The interest rate allowed on balances kept with HO by branches in rural/semi-urban areas was higher by one percentage point as compared to the rate allowed to urban/metro branches. Similarly, the interest charged on borrowing of urban/metro branches was higher by one percentage point (for six months only) as compared

to the rural/semi-urban branches. To eliminate this distortion, interest income and expenditure relating to transactions with HO were reworked on uniform interest rate for all branches. This income was added to interest income from advances to get the comparative total interest income of branches. Similarly, interest costs were worked out on uniform interest rate basis for borrowings from HO. The revised interest cost and interest income of branches grouped according to population of centres are given in Table 3.

Table 3 shows that the interest margin is the highest at 4.40 per cent for rural branches, followed by metro branches with 3.41 per cent. The spread was the lowest for semi-urban branches.

Profitability is also affected by non-interest income from commission, exchange, etc. and non-interest expenses like staff costs, premises costs, etc. The difference between the non-interest cost and the non-interest revenue is called 'burden' since the non-interest cost always turns out to be higher than its revenue counter-part. Burden as percentage of working funds is referred to as 'burden

efficiency ratio'. The difference between the interest spread and the burden gives profit and, similarly, the difference between the spread ratio and the burden-efficiency ratio shows the profitability of the unit. Table 4 gives details of burden for different population groups.

Table 5 shows that, after making adjustments for the major distortions, the profit ratio of rural branches at 2.56 per cent was below that of metro branches but was above that of semi-urban and urban branches as well as the entire branch network of the bank. This shows that in terms of profitability, the rural branches are not a liability to the bank. The oft-repeated theme of non-viability of rural branches is thus not an industry-level issue but one at the level of the units in the banking industry. Just as mismanagement is the major cause of industrial sickness, inadequate management competence in individual banks is a major cause of the non-viability of rural branches of many public sector banks. In all possibility, in banks with low profitability of rural branches, the situation may not be different for branches in other population groups also.

Subsidies, Patents and Market Access in Dunkel Draft

Rajaram Dasgupta

While the fiscal measures recommended in the Dunkel Draft seem to give Indian agriculture a boost in the international market by forcing the developed countries to reduce the subsidy level, the proposals on intellectual property rights will make production costlier because of royalty payment to multinationals for genetically engineered seeds and bio-substitutes, thus taking away the advantage given by fiscal measures.

THE recommendations of the Dunkel draft (DD) which influence agricultural economy can be broadly divided into two groups: fiscal and trading measures and intellectual property rights (IPRs).

The fiscal trading measures in DD include: (i) Reduction of agricultural subsidy, (ii) Conversion of all barriers on agricultural imports into tariffs (tariffication), (iii) Guaranteed minimum access for farm imports of between 3 and 5 per cent of consumption, (iv) Reduction of public distribution system (PDS) activity, and subsidised food only to those eligible on the basis of clearly defined criteria related to nutritional objectives, (v) Phasing out multi fibre agreement (MFA) which allows developed countries to impose discriminatory restrictions on textile imports inconsistent with GATT rules within 10 years, (vi) Removal of trade restrictive and distorting investment measures and extension of "equal national treatment" to multinationals (MNCs) within 5 years, and (vii) Treatment of foreign service enterprise on equal national footing with domestic service enterprises [1].

The list of intellectual property rights incorporate the following: (i) Patents available for any invention whether products or process, (ii) Patent right enjoyable without discrimination as to the place of invention, the field of technology, and whether products are imported or locally produced, (iii) Life of patents to be 20 years, (iv) In case of violation burden of proof lies on the accused, (v) Patents for plant varieties, (vi) Patents for living organisms, and (vii) Deletion of the provision for compulsory licensing, where a patent-holder does not want to manufacture an item in a country, and treatment of import at par with domestic manufacture for purposes of definition of the working of a patent [2,3].

The diminishing returns in agriculture has been well accepted in theory and has been empirically found to be correct at

least in the case of fertiliser use, which is the most important input today for increasing productivity [4]. This only implies an increase in the cost of production of agricultural output, specially food items, and hence increase in the price of these items. As food is the most important item of wage basket in a developing country like India, this increases wages and reduces profits of all the sectors. Also, the increase in foodgrains' prices gives a boost to inflation. And most importantly, food is considered as a different class of item. It is a basic need for both the rich and the poor. This is why even developed countries with a very small agricultural component in their national income try to protect the interests of farmers by providing subsidies in different forms so that adequate marketable surplus is generated and the non-agricultural population need not pay high price. This is the reason why these proposed fiscal measures have been opposed by developed countries. While France opposes the subsidy clause, Japan, South Korea, Switzerland, Norway, Canada and Israel, etc, have been opposing tariffication [1].

Aggregate measure of subsidy (AMS) has been considered as an index of subsidy in the DD. AMS has been recommended to be brought down to 13.3 per cent by 2003 [5]. According to Gulati and

Sharma, producer subsidy equivalent (PSE) can be taken as a proxy for AMS [6].

$$PSE = \frac{\text{total transfer to agricultural sector}}{\text{value of agricultural products}} \\ Q(P_d - P_w \times X) + D + I \\ Q \times P_d + D$$

Where

- Q = Agricultural production
- P_d = Domestic price of agricultural products
- P_w = International price of agricultural products
- X = Exchange rate for domestic currency
- D = Direct transfer by government to agricultural sector
- I = Indirect subsidy to agricultural sector.

According to their calculation PSE for India is negative and as high as 72.5 for Japan (Table 1). This gives an impression that if DD is accepted, Indian agricultural products will become competitive in the world market and hence agriculture will be a foreign exchange earner for industrialisation. The agricultural sector thus is supposed to play a vital role in the development process in India.

This is, however, not as simple as it appears. Firstly, India is not a country self-sufficient in food if the total nutritional requirement is to be met. If India does not regularly import foodgrains, it is only because of the lack of purchasing power. More than 30 per cent of the population lives below the poverty line and because of their meagre income do not demand even the minimum food. India in true sense does not have exportable surplus in foodgrains at present. In the international context, India constitutes 17 per cent of the world population and accounts for only about 12 per cent of total cereals and pulses production (Table 2). On the other hand, the US while constituting about 5 per cent of total population accounts for 13 per cent of foodgrains production. What Table 2 suggests is that exportable surplus in

TABLE 1: PRODUCER SUBSIDY EQUIVALENT (PSE), PER CENT

foodgrains lies generally with developed countries only. And it can be safely assumed that these countries are not exporting at the cost of domestic consumption.

If we now look at the trade pattern of agricultural products (food, beverages and tobacco), the US, Canada, and other Asian countries appear to be net exporters. In the case of India, tea is a

major export item. Recently superior rice and horticultural products along with animal products are gaining importance. India seems to have comparative geographical advantage in trading with her neighbouring countries, eastern half of African continent, and middle east countries and perhaps erstwhile USSR. Africa's net import is quite negligible, and low income does not seem to attract the import of high valued cereal crops and other agricultural products from India in future. Japan's trading advantage will continue to lie with the US and neighbouring Asian countries, and Europe's geographical advantage outside the continent lies with Canada, the US, Mexico, North Africa and the middle east. India therefore has to depend mainly on West Asia, neighbouring countries and erstwhile USSR for her agricultural exports.

Now, even if we concede that India will be allowed to increase its PSE from 2 to 13, and the US, Canada, Mexico and the European community, are forced to reduce it to 10 from existing high figures, India would not possibly gain from this.

Firstly, as we have seen earlier, India does not have much geographical advantage with the net importing regions. Secondly, since India does not have exportable surplus of foodgrain items, either more area has to be brought under cultivation or the yield rate has to be increased to have surplus farm products for sale. The scope of increasing net area is almost nil. Gross area can be increased by raising cropping intensity. But for that a large amount of investment in irrigation is required. In the case of India, growth of minor irrigation has taken place mainly in areas where canal irrigation has spread. Under the scheme of reducing fiscal deficit, the major victims has been the development sector including irrigation.

although the Eighth Plan has emphasised the same. On agricultural finance front the financial sector reforms do not seem to be priority sector friendly. Under the given circumstances the only reliable alternative left is to increase the yield rate which can be possible through either high yielding variety of seed or higher dose of fertiliser which again requires credit and does not have much importance in the context of financial sector reforms.

So far as raising yield rate is concerned, India is in a quite disadvantageous situation because of poor soil fertility. It is quite evident from Table 4 that India's yield rates of cereals, pulses, sugarcane and potato are the lowest. This, however, does not say much about inferior soil quality which is evident from Table 5

which shows the fertiliser consumption of a few countries. The US yield rates of cereals, pulses, sugarcane and potato are 2.5, 3, 1.2 and 2 times more than India's whereas the US consumes only 43.4 kg of NPK per hectare compared to India's consumption of 64.1 kg. Similarly, Canada, Argentina, Mexico and Thailand, although have higher yield rates consume less amount of nutrient per hectare compared to India. Yield rates of cereals, pulses and potato in France are 3.3, 9 and 2 times more than those in India whereas France consumes only 3.1 times more fertiliser than India in each hectare. Although Australia's cereals yield rate is lower than that of India's, pulse, sugarcane and potato yield rates are much higher. However, Australia's fertiliser consumption is only 2.4 kg per hectare compared to 64.1 kg in India. In other words, because of diminishing returns to fertiliser use, cost of agricultural items in India will rise so much that they will not be competitive, specially to those from the US, Canada, Argentina, Mexico, and Australia.

Given this background of non-competitiveness and Dunkel recommendation that all the countries have to import 3-5 per cent of their agricultural consumption (not export of 3-5 per cent of agricultural production), most of the import requirement will be met by the US alone. Given the world production of cereals and pulses at 2,014 million tonnes, the world import requirement at 5 per cent

level, the total world import will be 100 million tonnes. With 500 kg of per capita annual requirement of cereals and pulses, the US domestic consumption would be 125 million tonnes, and hence a surplus of 189 million tonnes which is more than the stipulated minimum import requirement for the rest of the world. With similar assumption Europe's surplus seems to be 40 million tonnes out of which 30 million tonnes come from France alone.

Therefore, 13 per cent of PSE does not seem to help India much because of her poor soil fertility, and hence the comparative disadvantage in the case of foodgrain items. India, however, can still export high value cereal and horticulture crops. To produce these crops, India has to shift cultivation away from usual foodgrain items. If the present level of purchasing power is maintained this implies a supply gap in foodgrain items which would necessitate rationalisation of food import. Initially it may seem to follow the rule of comparative cost advantage and India may obtain her imports at competitive price. However, as mentioned earlier, food is not only a basic necessity item, it is a great political weapon too. The developed countries with the engineered demand increases and artificial price hikes can play havoc with India's sovereignty. Besides this, if foodgrains production is de-emphasised, it will be grown on inferior land and the cost of production may further rise. This will induce prices of imported foodgrains to go up.

Now as food is the most important item in the industrial wage basket, rise in food price tends to increase the wage rate, inflation, reduce profitability and dampen

the spirit of investment. And because of increase in the cost of production, these industrial goods lose export competitiveness. Alternatively more capital intensive technologies may be used displacing labour. First of all, we are not sure whether this will help us in the international market to compete with the developed world which has technological advantage of at least 10 years which they are going to further improve by IPR, the other aspect of Dunkel draft. Secondly, even if capital intensive technology helps in the growth process, the fruits of growth will be confined to a few deciles as the labour force will be kept out of this process.

INTELLECTUAL PROPERTY RIGHT (IPR) EFFECT

IPR is another dimension of the Dunkel draft. The present Indian Patent Act covers (a) process patent for food, medicine, drug and chemicals, (b) product patent for other items, and (c) neither process nor product patent in connection with agriculture. DD on the other hand demands protection for (i) product, (ii) plant varieties, and (iii) living organisms. The US at present has all the above patent facilities. However, it must be noted that only since 1980, the US has implemented the second and third types of patent. Another point to be noted is that after 1970, when process patent system was implemented, India made tremendous progress in pharmaceutical sectors with remarkable presence in the international market because of lower price achieved through discovery of cheaper process for pharmaceutical products.

Bio-technology which is the technology of tomorrow for agriculture has applications in vaccine, drugs and mining. This technology employs production processes based on living organisms like bacteria, living forms like plants and other living beings. DD may affect Indian agriculture very adversely through new patent laws which restricts the research and use of bio-technology. The main non labour inputs in agriculture are land, water, seed, fertiliser, and pesticides. Last three items are going to be patentable, and hence are going to affect agriculture.

Genetically engineered varieties of seed of food and cash crops owned by multinational bio-technology companies will be sold in India [3]. Price of these seeds will have royalty component which has so far been absent. Naturally this increases seed price. As successive generation of seed is protected by patent, the farmers may not be allowed to save seed out of their own harvest to sow their next crop. Even in some countries where there is intellectual

protection for plant varieties like plant breeder's right, there are two exemptions. (i) It allows plant breeders/scientists to use protected varieties for further breeding work without paying royalty, and (ii) It gives the farmer the right to save seed for his personal use from his harvest.

Since unlike in other areas, improved varieties of embryo requires an earlier generation of embryo, the above exemptions ensure that the socially useful activity of breeding new improved varieties continues unhindered. If DD is accepted, this advantage will no longer be there. Research will be monopolised, and gains will not trickle down. In that case India will not be able to increase the yield rate through high quality seeds to make her produce competitive in the world market. Whatever progress India has made in bio-technology will be completely diluted and then technology available with India will be about 20 years old.

BIO-SUBSTITUTES

Because of pressure from environmentalists, and operation of diminishing returns, agricultural sector is compelled to move away from the use of chemicals to bio-substitutes (bio-fertilisers and bio-pesticides)[3]. This may reduce the cost of cultivation also. Research has already started, and India has been taking part in the research in this area.

Plants cannot use nitrogen from the air, chemical fertilisers fix nitrogen in the soil for the plant. If bio-technology succeeds certain bacteria in the environment can donate ammonia to the plant; blue green algae can fix nitrogen through water fern called azolla. A group of fungi called mycorrhiza enter the roots of trees, shrubs and crops and solubilise iron phosphate in low fertility soil thus making them available for plants; in addition they mobilise other nutrients like copper and zinc. *Bacillus megaterium*, a special kind of bacteria increases the phosphate status in the soil, minimising or doing away with the need for chemical phosphates. Certain kinds of soil bacteria when injected with methane from the air release enhanced amounts of phosphorous, potassium, calcium and magnesium. A whole range of insects and worms have been re-discovered to be pressed into service to fight pests. The Ladybird beetle feeds on bugs attacking crops as diverse as mustard and cauliflower; another kind of worm eats up the larva of insects attacking the cowpea thus protecting the crop.

Certain micro organisms function as natural pesticides. There are more than 100 kinds of known bacteria, virus and fungi which attack insects. *Rehizobacteria*

that promote plant growth are useful agents of biological pest control. *Bacillus thuringiensis* kills insects by producing a toxin which is safe. *Bacillus papillae* is effective against beetles. In addition to these naturally occurring micro-organisms, genetically engineered insect pathogens are being tried out as biological agents of pest control.

What is therefore clear is that there is going to be a revolutionary change in agricultural technology in which living micro-organisms are going to play an important role. If DD is going to patent all these, the control over entire range of seed, fertiliser and pesticide will be with multinationals which not only have a lead in bio-technology, but also command enormous capital to invest. This will, no doubt, render all research in the hand of multinationals which would make all inputs costly because of monopoly. Agriculture thus will turn out to be a capital intensive field of technology. Small and marginal farmers will then have no relevance in the agricultural production.

DD thus seems to give benefit to India in the international market by forcing subsidy reduction across the countries. This however, is quite illusive as India does not have a comparative advantage in agricultural export. Market access approach on the other hand forces India to import foodgrains for which foreign exchange has to be earned at the cost of domestic cereals production. This and the IPR effect together increases agricultural costs and makes the agricultural and industrial goods which are now going to have higher wage content non-competitive because of the increased price and higher royalty component. DD therefore makes us lose our sovereignty by forcing us to change our Constitution for accommodating new patent rules and tries to cripple the economy which otherwise has extraordinary potential.

The Third Stratum

Nirmal Mukarji

The fundamental question before panchayats everywhere in the country has for long been whether they are there for development functions only or for the wider purpose of self-government. The central objective of the Constitution (73rd Amendment) Act must, therefore, be seen as self-government, unabridged by the quite unnecessary references to economic development and social justice and the wholly avoidable Eleventh Schedule.

THE Constitution (73rd Amendment) Act has, in essence, constitutionalised panchayats as a third stratum of government at and below the district level. Hitherto the country had lived with a two-layered governmental system, the union and the states. The terrain below the states was left unprovided for, except only for a Directive Principle for setting up self-governing village panchayats. For four decades and a half the Directive Principle remained unacted upon. Now, to the credit of the present-day law-makers, the omission has been rectified and more. The amended Constitution requires the states to constitute panchayats as institutions of self-government not only for villages but also at intermediate and district levels. Consequently there will, henceforth, be three strata of government: the union, the states and the panchayats. A more radical change is difficult to visualise. Its implications are far-reaching, perhaps not fully grasped even by those who legislated the measure.

I

A major obstacle to understanding lies in the content of the 73rd Amendment. For, on the one hand, it defines panchayats by whatever name called to mean institutions of self-government. It also makes it mandatory for every state to constitute panchayats at the three levels mentioned, sensibly not insisting on the intermediate level in tiny states. Further, and most crucially, it provides that state legislatures "may, by law, endow the panchayats with such powers and authority as may be necessary to enable them to function as institutions of self-government". The plain meaning of these provisions, read by themselves, is that self-government for panchayats is the central objective. The only point on which controversy could arise, and very likely will, when it comes to the state legislatures endowing powers and authority to the pan-

chayats, is about the meaning to be given to the expression 'self-government', especially when applied to each level. But more about that later.

Yet, on the other hand, there is the qualification that the very same law to be enacted by a state legislature "may contain provisions for the devolution of powers and responsibilities upon panchayats at the appropriate level, subject to such conditions as may be specified therein, with respect to (a) the preparation of plans for economic development and social justice, and (b) the implementation of schemes for economic development and social justice as may be entrusted to them including those in relation to the matters listed in the Eleventh Schedule". The Eleventh Schedule painstakingly spells out 29 items. It can be no one's case that economic development and social justice are not desirable goals. Therefore planning for them cannot really be objected to, though implementing entrusted schemes in this field might, because that could reduce panchayats to mere executors of handed-down programmes. But the more important question is whether this later and somewhat over-elaborate provision dilutes the objective of self-government. Does it, in other words, abridge the rights of the state legislatures down to endowing development functions only?

The fundamental question before the panchayats everywhere in the country has, for long, been whether they are there for development functions only or for the wider purpose of self-government. Article 40 of the Constitution explicitly visualises self-government for village panchayats. The relatively limited notion of development came in with the Balwantray Mehta Report, 1957. Going refreshingly beyond its terms of reference, the Mehta Team recommended democratic decentralisation to a three-tier panchayat structure, but this would handle development work only.

Seen against the provisions of Article 40, panchayats were no longer to be confined to the village level, but their functions were to be restricted to less than self-government. The recommended pattern was, with some variations here and there, adopted by most of the states. It was also persisted with in the Asoka Mehta Report, 1978, although a nominal bow was made to self-government in an annexure containing a draft Constitution amendment bill.

In his dissenting note to the A Mehta Report, E M S Namboodiripad stated: "Democracy at the central and state levels, but bureaucracy at all lower levels—this is the essence of Indian polity as spelt out in the Constitution...I cannot think of the panchayati raj institutions as anything other than the integral parts of the country's administration with no difference between what are called the 'development' and 'regulatory' functions...I am afraid that the ghost of the earlier idea that panchayati raj institutions should be completely divorced from all regulatory functions and made to confine themselves only to developmental functions is haunting my colleagues." He set the goal as follows: "What is required is that, while certain definite fields of administration like defence, foreign affairs, currency, communication, etc, should rest with the centre, all the rest should be transferred to the states and from there to the district and lower levels of elected administrative bodies." This was clearly a plea for going beyond development to self-government, although that expression was not used.

The fact of the matter is that it is entirely within the competence of the state legislatures to decide what powers and authority the panchayats should have in order that they function as credible institutions of self-government. This was the Constitutional position all along; the 73rd Amendment has served to reaffirm it. The introduction of the development motif in the amendment, perhaps, limits the competence of the legislatures only in the sense of indicating the minimum that each state legislature should transfer to the panchayats. There is, in other words, a floor but no ceiling. How far above the floor a particular state may go is a question of policy for that state, bearing in mind that the panchayats from now on are to be (1) Constitutional bodies, and (2) institutions of self-government. The central objective of the amendment must, therefore, be seen as self-government, unabridged by the quite unnecessary

references to economic development and social justice and the wholly avoidable Eleventh Schedule.

II

Had there been just the 73rd Amendment, unambiguously proclaiming self-government for the panchayats, shorn of the obfuscating references to economic development and social justice, the central purpose of Constitutionalising a third stratum of government would have been clear. What has made for further confusion is the simultaneous enactment of the 74th Amendment for municipalities. For, although self-government for these bodies is surely to be welcomed, the legislation of two separate amendments divides the governing space below the state level into two parts, rural and urban, and gives the partition Constitutional legitimation. The idea of a single third stratum, therefore, becomes difficult to grasp.

The 74th Amendment seems to be a hasty afterthought. For one thing, it is almost a carbon copy of the 73rd Amendment, with the identical references to economic development and social justice with its own pointless Twelfth Schedule. It looks as if some independent thinking went into the panchayat law and then, one day, the Municipalwalahs suddenly woke up and said "we too, please" and were simply served the panchayat dish with municipal sauce. Secondly, it thoughtlessly constitutionalises an artificial dichotomy between rural and urban when all previous thinking has stressed the continuum between the two. Thirdly, in a frantic bid to cover this lapse, it gives Constitutional status to district planning committees, which will "consolidate the plans prepared by the panchayats and municipalities" and "prepare a draft development plan for the district as a whole". Neither the Planning Commission nor State Planning Boards have even statutory backing, leave aside Constitutional recognition. Planning from below has indeed taken a strange route, especially as these high-status district bodies will be constitutionally limited to preparing only draft plans.

There is a firmly embedded concept that panchayats are for the rural areas. It is rooted in the historical reality of village panchayats having existed from ancient times. The Directive Principle of State Policy in Article 40 also requires the organisation of village panchayats. The democratic decentralisation devised by the B Mehta Report rested on village panchayats at the base. So, with some refinements, did the scheme of the A Mehta Report. The linking of panchayats with the rural areas has now received Con-

stitutional endorsement by the 73rd Amendment. Administrative arrangements reflect the linkage in that the union has a ministry of rural development looking after panchayat matters and many states have ministers for panchayat and rural development. The panchayats are thus locked into a 'rural only' bind.

As far back as 1963, a Rural-Urban Relationship Committee was appointed by the government of India to make "recommendations regarding the relationship between the urban local bodies and the panchayat raj institutions". The committee observed that urbanisation should be considered as a 'continuous process of transition from rural to urban', that "a whole area should be treated as one unit for administrative purposes" and, further, that "rural and urban areas falling within it should be treated as integral parts of the area" for the purposes of planning and implementation. Recalling this, the A Mehta Report remarked that the "evolution from rural to urban way of life is a continuous process with sequences from a tiny hamlet to a sizeable city". Instead of an urban-rural dichotomy it saw a rural-urban continuum, which called for linking up the rural areas with urban focal points.

There is growing evidence of the transition from rural to urban in the shape of a large number of urbanised villages. At present, these are growing in a haphazard manner with little or no civic amenities. If there is no proper town planning from now, these will become ugly urban spreads, the redevelopment of which will be enormously costly later. With the growth of agriculture and increasing prosperity in the countryside, more such centres are likely to come up as focal points of business, trade, marketing and servicing. In West Bengal, for instance, places like Dhupguri in Jalpaiguri district and Garbeta-Amlagora in Medinipur district have grown beyond recognition in the last decade or so, and are now bustling urban market centres. Notwithstanding their 'rural only' origin, the panchayats must squarely shoulder this rapidly growing urban reality in their respective rural areas. If this enlargement of their functions calls for suitable legislative, administrative and financial backing, that should be forthcoming from the states.

It bears repetition that the 73rd and 74th Amendments have, unfortunately, constitutionalised what is in fact an artificial dichotomy between rural and urban self-government. If there is a continuum stretching from hamlet to city, what is called for is an overarching institution which does away with dichotomy and reflects the reality of the continuum. The district planning committees implanted,

somewhat strangely, in the 74th Amendment are not the answer, because without executive functions they will not in any sense be institutions of self-government. Eventually the two amendments will need to be amalgamated to provide for integrated self-government for the continuum, in the process relieving them of unnecessary clutter. Until then, each state must seriously think of integrative legislation to merge existing panchayat and municipal laws in order to build a coherent third stratum, without offending the basics of the two amendments. While megalopolises like Calcutta-Howrah may be governed in a manner suited to their requirements, the municipalities and the panchayats in the districts should become component units of self-government within an overall set up of district self-governance.

III

More telling than any shortcoming in the two amendments is the all-pervasive mindset amongst the ruling elites that the natural mode of governing the country is through governments at the union and state levels only, as originally conceived by the founding fathers, and any attempt to insert a third stratum below the states would be fraught with unpredictable perils for the polity. Support for this view comes from the fact that the Constitution describes India as a Union of States, that its federal scheme divides powers between just the union and the states and that the union states duality runs through its entire content. Support also comes from the familiar *status quoist* argument that if things have not worked out well the fault is not so much with the system as with those who have operated it. Finally, support also comes from the plain fact that the 73rd and 74th Amendments make no consequential change in the pre-existing two-layered scheme of government outlined in the Constitution.

We may look at these points seriatim. The Constitution that "we, the people of India" gave ourselves in 1949 was a combination of two elements: concepts and structures. The concepts reflected free India's aspirations. Mainly these were embodied in the Preamble and the two sections on Fundamental Rights and the Directive Principles of State Policy. This was the creative part, providing the bedrock of all else. The structural part, by contrast, was pedestrian. It set out how the country was to be governed as a "sovereign, democratic republic". Mimesis rather than creativity was its distinguishing feature, for it borrowed heavily from the Government of India Act, 1935. Perhaps carrying on with what was

already there was most convenient at the time. Perhaps this also suited the then ruling elites, politicians and bureaucrats. The structures devised were, at best, appropriate only for that stage of the republic. Unlike bedrock principles, these can hardly be treated as binding for all time. "We, the people of India" have to keep inventing new structures appropriate for our times, which means that mindsets should go.

That a system is as good as the people who work it is undoubtedly true. But, equally, even the best people cannot make a system work once it becomes out of tune with changed circumstances. Two indices of how much things have changed are: one, the country's population has more than doubled since independence; two, thanks to adult suffrage and frequent elections, political awareness has enormously grown among previously quiescent people. The bureaucracy, to which the two-layered system entrusted the business of government below the state level, is wholly unable to cope. It has also become so corrupt that Rajiv Gandhi, as prime minister, had ruefully to admit that only 15 of every 100 paise of development money reached the intended beneficiaries. Increasingly the people want to manage their own affairs. 'Panchayati raj', whether of the apolitical B Mehta variety or the political A Mehta one, will no longer do, because the 'raj' element is wholly missing in both. Indeed the expression 'panchayati raj' has acquired a bad odour. A third stratum of self-government is the structural invention we now need.

The absence of consequential changes is a point well taken. It is neither possible nor necessary to alter comprehensively the union-states duality built into the Constitution. It is sufficient to focus attention on the single issue of decentralisation, which after all is what a third stratum is all about. Owing to the then prevailing circumstances, the framers of the Constitution opted for a federation with a strong centre. Subsequently, the logic of the strong centre concept shaped Congress politics and the policies of central planning in such a way as to make the union much stronger and, correspondingly, the states much weaker than the Constitution-makers ever visualised. If now the states endow meaningful powers downwards, the system will resemble an hour-glass, with the states at the narrow waist, the union powerwise broad at the top and sub-state institutions functionwise broad at the bottom. Politically, this is unlikely to be acceptable to the states. Therefore, the union must first decentralise to the states so that they in turn may have enough to decentralise to lower formations.

IV

If there is one factor above all that is responsible for the negative features that have emerged in the polity and the economy, it is the over-centralisation of powers and functions at the union level. In many ways, this has converted what was meant to be a two-layered federal arrangement into a Delhi-centric unitary system. One has only to see the sprawling ministries in the capital dealing with subjects in the State and Concurrent Lists to get an idea of the enormity of the union's usurpation of state functions. In the federal scheme, the union and the states were to share the burden of governing the country, with the states acting as the vital communicating links with the people. The states have been too enfeebled to fulfil this allotted role. For one thing, they have been reduced to begging the union for finances and battalions. Secondly, the fear of dismissal under Article 356 haunts them and they have thus been rendered less than partners in the government of the country. Consequently, we have the strange spectacle of a bloated union, far removed from the people, attempting to govern almost singly in sectors best left to the states.

The principle of a 'federation with a strong centre' impelled the Constituent Assembly to ensure that the union was more than well provided with financial resources, consciously leaving the states with less than their requirements. The idea was to give the union financial leverage to deal with the states. But what has happened is that, with over-centralisation, the union has used its surpluses in profligate spending rather than in balancing the requirements of the states. For a dozen years or more, it has had to divert capital resources to cover its revenue deficits. Especially during the 80s, its financial management has led to irresponsibly heavy borrowings abroad. The economic crisis that engulfed the country in 1991 was entirely the creation of the ruling elites at the centre, who acted as if accountable to no one. If there is a silver lining to this dark cloud of over-centralisation, it is only that the crisis compelled the elites to begin dismantling the corrosive licence-permit raj. So far, however, the new economic measures have had little impact on corruption or prices and none whatsoever on poverty.

As noted earlier, there has been a phenomenal rise in the political consciousness of the people. This has awakened dormant aspirations among groups at the periphery of the polity. Thus dalits are organising against upper castes, tribals launching movements from Bodoland to the Narmada basin, backward classes using Mandal to advance, Muslims think-

ing anew after the Babri Masjid, and so on. Punjabi Sikhs and Kashmiri Muslims have taken to militancy, much as the Nagas and the Mizos did a generation ago. It looks as if the periphery is in revolt against the dominance of a 'mainstream', firmly entrenched in its over-centralised fortress of governance and politics. Instead of seeing the positive message in all this, the 'mainstream' has reacted in two ways. Politically, it has tended to treat all such revolts as anti-national. On the governmental side, it has overutilised the coercive instruments of draconian laws and armed forces, virtually outlawing human rights, except when it came to 'mainstream'-sponsored violence, such as at Ayodhya and resultantly at Bombay, Surat and elsewhere. The siege mentality of 'mainstream' elites, whether in power or not, is hardly suitable for governing sub-continental India on the move.

On one bank of the river of national life is the overcentralised Indian state, thinly composed of the ruling elites in the union and some of the so-called national political parties. These are the self-styled 'mainstream' who never tire of exhorting others to join them. On the other bank are massed the people of India, amongst them being in myriad groups that make us rich in diversity. Obviously there must be a bridge to connect the two, but the river is wide and requires several spans. Those who wrote the Constitution built only the single span linking the centre with a mid-point pier where the states were clustered, the journey beyond being left to bureaucratic boats. This first span having been severely damaged through misuse, the Indian State is left stranded on one bank, out of touch with the people on the other side. Without first repairing this span, the 73rd Amendment has commenced construction on the portion between the states and the people. The project is well-intentioned but absurd. It is the entire river which needs a bridge, not merely a section of it.

Leaving the analogy behind, it is imperative that the Indian State should abandon the distortion of over-centralisation, which has not only made a mockery of what the founding fathers intended but has brought the polity and the economy to the brink of disaster. Having regard to the changed circumstances, the earlier principle of a 'federation with a strong centre' needs to give way to a 'federation with a strong centre and strong states'. It is no longer sufficient for the centre to decentralise merely to restore the position originally written into the Constitution. Strong states will come about only if the states themselves decide how much autonomy they must have. So long as this is within

the framework of the Constitution, in the sense that the basic features are not infringed, that should become the new dispensation, subject to parliament ensuring that the centre is enabled to perform its due role. Only then will it be reasonable to expect the states to part with enough power to make the third stratum truly self-governing.

Finally, after this lengthy detour, two inter-connected questions need to be addressed. Neither the 73rd Amendment nor what is virtually its annexure, namely, the 74th Amendment, are of help in answering them. (In what follows, for the sake of simplicity, only the 73rd Amendment and panchayats will be referred to.) First, what does self-government mean if each of the three levels of panchayats in a typical state is to have this commodity? Second, when it comes to endowing powers and authority, how far should the state legislatures go to ensure self-government at each level?

The literal meaning of self-government is autonomy or government without outside interference. But obviously the panchayats cannot enjoy full autonomy, set as they are within individual states. Nor can the states, placed as they are within the Indian union. What the 73rd Amendment has done is not only to constitutionalise three strata of government but also, within the third stratum, three levels of panchayats. Therefore, there will now be a five-storeyed pyramid of governments rising from the village panchayats at the base to the union at the apex. At each level below the union there can be no more than an appropriate measure of autonomy. Thus self-government at a particular level means such partial autonomy as is appropriate for that level. The principle holds for the states as well as for each panchayat level.

But, then, how much is appropriate for each level? The very idea of autonomy, partial though it must be, suggests that the basis for appropriateness should be entitlement from below rather than endowment from above. Consequently, village panchayats should be entitled, by law, to do what they can best do at their level. Thereafter, intermediate level panchayats should be similarly entitled, and the same for district panchayats. The functions to be performed at the state level, as a consequence, would be the sum of what the union must decentralise, on the one hand, and, on the other, such remnant functions as are left over from panchayat entitlements which need to be attended to only at the state level. In the determination of entitlements, the concerned levels would have to be involved. Just as the states themselves rather than parliament unilaterally should decide their entitlement to autonomy, as suggested earlier,

the district panchayats too should determine their entitlement rather than leaving the question entirely to the state legislatures. Modalities will need to be worked out to extend the principle further down also.

These are fundamentals to be borne in mind. In practice, state legislatures will be influenced by objective circumstances. In several states, the dominant castes constituting the ruling elites may be reluctant to part with power in any significant measure. Even assuming that some states will have enlightened enough leadership to transcend self-serving considerations, there may be nagging doubts about the wisdom of politically empowering panchayats controlled by the already powerful in social and economic terms. Any zeal to decentralise may be moderated by the sobering thought that feudal structures and panchayats do not go well together, for the combination further weakens the disadvantaged. The argument has been around for a long time that structural change through land reform is an essential prerequisite to empowering panchayats. But so has the counter-argument that democratic panchayats will, at least in the long run, foil feudal power. It is such considerations that have produced varying patterns of underdevelopment in the panchayat systems of nearly all the states.

West Bengal's panchayats are by far the most developed in the country. They are the first in the country of a new generation of panchayats in which political parties openly participate in elections. In the earlier generation, panchayats were consciously sought to be kept apolitical on the ground that politics would promote divisiveness and retard development. The Asoka Mehta Report, 1978 favoured open participation by political parties as this would "ensure clearer orientation towards development programmes and facilitate healthier linkages with higher level political processes". West Bengal immediately opted for political panchayats. Secondly, the panchayats of the state have by now endured long enough to be treated as essential components of the state's system of governance. The first panchayat elections were held in 1978 and since then elections have been held regularly every five years, the fourth in the series being due on May 30. In most other states, panchayat elections are not held on time. In the three states that followed West Bengal's lead with their own versions of political panchayats, viz, Karnataka, Andhra Pradesh and Kerala, the experiments did not survive changes of government at the state level. At present, therefore, West Bengal is the only state which has going political panchayats.

On coming to power in 1977, the Left Front government embarked upon a programme of rural resurgence which had

two legs, panchayats and land reform. Even prior to the enactment of the West Bengal Panchayat Act in 1973 and long before elections on its basis were held in 1978, the concentration of land in a few hands had been substantially broken. This was because, during the years 1967-70, a massive drive had been undertaken under the first and second United Front governments to detect and vest lands that had been clandestinely retained by landowners beyond their entitlements. Over a million acres of good agricultural land had thereby been taken over. This considerably weakened the hold of the big landlords who had traditionally led rural society because of their dominant economic and social position. Thus when the first panchayat elections took place the power structure in the rural areas had already altered substantially. As a result, instead of empowering the already powerful, the panchayats in West Bengal placed power in the hands of new-comers who belonged to a middle category of society. The dedicated work of this group is responsible for the present standing of West Bengal's panchayats.

Over the years, West Bengal's panchayats have achieved two important objectives. First, they have recruited new people into politics and given them on-the-job exposure to the art of self-governance from the grassroots level upwards. They have thus served as nurseries for new entrants and have by now created a rich pool of experienced leaders. What is particularly impressive is the high rate of new intake. In some of the panchayats, only two or three members are survivors from the previous five-year spell, all the rest being new-comers. Also impressive is the 'upward mobility' to be seen. Many panchayat functionaries have on the basis of their performance, moved up to higher levels. Successful former sabhadhipatis have become ministers in the state government. Second, in spite of some deficiencies and weaknesses, the state's panchayats are regarded as a success story by almost everyone, regardless of political affiliations. An index is the vigour with which panchayat elections are fought. Acceptance by the people is the most significant aspect. To a considerable extent, there is now acceptance even by that last bastion of conservatism, the bureaucracy, especially its younger elements.

As a result, West Bengal is well placed to be the first off the mark with self-governing panchayats, much as it was with political panchayats 15 years back. But other states may not find themselves as happily situated. Some have virtually no panchayats; many have ineffectual apolitical panchayats; a few have had experience with political panchayats. All are now required to move on to self-governing panchayats. It will be interesting to see how far they succeed in bringing a third stratum of government into existence.

Surat under the Raj

Vinay Lal

Rhetoric and Ritual in Colonial India: The Shaping of a Public Culture in Surat City, 1852-1928 by Douglas E. Haynes; University of California Press, Berkeley, 1992; pp 363, \$ 49.95.

THE accommodation to, and contestation of, colonial rule by Indian 'elites' has long been a subject of great interest to historians of modern India, and Douglas Haynes' monograph, which focuses on the politics of Surat, is a contribution, albeit with a difference, to that literature. One would have thought that this subject had been pretty much exhausted; indeed, over the last decade or so the more prominent works in Indian historiography have taken us along different directions, so that the voices we hear now are mainly of women, peasants, rebels, and other 'subalterns', and government functionaries or English-educated Indians do not appear to be the only sources of 'agency'. Haynes returns us to a preoccupation of the earliest literature, that is the appropriation by Indians of liberal or 'western' political values, but he does so with interpretive models that in his view owe more to Gramsci, ethnohistory, and 'cultural studies' than they do to Weberian social science, which has long been dominant in the American academy, with its emphasis on 'modernisation' 'westernisation', and rationality. Haynes proposes, in short, to infuse his work with a focus on "politics as symbolic action and discursive practice", so that the intrusion of democratic values into political life is seen less as the consequence of "forces external to the political process" than as a process resulting from "day-to-day struggles for power and justice under colonial domination" (p 5). Haynes rejects the 'evolutionary' model whereby the emergence of democracy is seen as "an outgrowth of a universal human drive for freedom (as defined in western terms)" and the acceptance by the non-western world of the values associated with liberalism as somehow "natural". It is the tension between the appeal of western ideas, and the constraints that colonialism necessarily imposed in the shaping of a democratic ethos, that informs Haynes' exploration of the political culture that south Asian elites set out to fashion for themselves.

It is with a quick sweep that Haynes traces the history of Surat from the 17th century, when it occupied a dominant place in India's domestic and international trade, to the late 19th century, by which

time it had been reduced to something of a mofussil town, certainly a pale image of its former self, hovering in the shadows of Bombay's gigantic hulk. The 'serious contraction' in Surat's economic activity owed a great deal, in the first instance, to the "growing insecurity of trade routes in the Mughal empire" and increased pressures upon traders by Mughal noblemen, and secondly to the establishment of British colonial rule. Throughout this period of decline, and indeed into the 20th century, there remained intact what Haynes, obviously invoking E. P. Thompson, calls a "moral economy of domestic manufacture". Business relationships were built around certain social ties, whether constituted as "joint-family, caste, community, and patron-client relations", which ensured that even in times of hardship and financial insecurity merchants and artisans were not left without some means of pecuniary support. As Haynes points out, an understanding of this moral economy would suggest the severe shortcomings of social science models that posit an incompatibility between these kinds of social structures and market-oriented economies (p 39). Although colonialism wrought great changes, and compelled the residents of Surat to adjust to new institutions, such as railways, postal services, and customs, indigenous commercial networks displayed a remarkable resilience (pp 45, 46). Surat was not only able to retain its niche, however small, within the metropolitan colonial economy by sustaining "forms of commerce that did not compete with European products", such as trade in pearls and spirals of silver and silver gilt, but it also reproduced 'pre-existing social relations' (p 50). Perhaps the transition from 'status' to 'contract' was not as complete as some historians have suggested.

Haynes moves from the larger picture to a more microscopic view of the different social groups that comprised Surat's population. Under the rubric of the inner politics of the city, he considers the idioms by means of which members of the merchant castes marked their presence, and also the place of Hindu 'communities of low and middle status', Muslims, and Parsis in the economic, social, and cultural

life of Surat. Merchants engaged in religious giving because they, no doubt, saw it as a form of *dharmic* activity, but just as significantly it allowed the transformation of 'financial capital' into 'symbolic capital' that worked to generate and enhance their standing within the community. Religious munificence is, as Haynes notes, "common to Hindu commercial communities all over India", but it has had a special place in Surat and the rest of Gujarat (p 60). There the 'mahajans' with tightly knit organisations constituting a form of corporate activity, wielded an enormous influence not only in commercial affairs, but in the civic life of the community as well by endeavouring "to protect the economy of trust from being overwhelmed by a commerce based on contract and courtroom" (pp 62, 63). When, for example, famine struck in 1899-1900, the mahajans not only created Hindu orphanages, but also exercised pressure upon grain merchants, accompanied by the threat of sanctions, to cease all exports (pp 66, 67). Whatever the impulses of capitalism, and the institutional pressures of colonial rule, the inner life of the Hindu communities continued to reproduce a social order where questions of family status and reputation remained predominant, "in which older idioms of authority met the challenges posed by changes in the larger world", and "collectivities based upon descent often retained the cohesion necessary to enforce a wide range of group norms" (p 80). Much like the Hindus, the Muslims and Parsis too persisted with the structures and idioms of their social life, and "not because of any inherent intransigence to change", which is what those who argue for an inalienable divide between a 'stagnant' India and an ever changing west would like us to believe, "but because these social forms remained relevant to the material and psychic needs of the population" (p 80).

Surat's residents lived, from the 16th century onwards, under the rule of outsiders. The 'outer politics' of the city was thus characterised by accommodation to the Mughals and then the British, and this took the form of, deferential behaviour, tribute, acceptance of imperial patronage, and even small acts of resistance. Haynes does not dwell very long on Surat under the Mughals, for it is the advent of a new public culture under the British, succeeding the initial establishment of what Haynes calls the 'Anglo-Bania Order', that is the subject of his study. In the evolution of this public culture, 'public opinion' was to assume great importance, for, though the colonisers might argue that

France. The war also required the introduction of exchange control and its administration was the responsibility of the Bank—a task not much to the taste of the Old Lady, especially as it involved direct contact with the public. On the whole, work increased greatly while staff declined. In consequence, office machines found their way into Threadneedle Street, but more importantly, the employment of women in the Bank shot up. Very early in the war, in 1940, the number of women employees exceeded that of men and this position, we are told, has continued unchanged.

The position of women employees is one of the most interesting strands that run through the book. The bank is seen as always awkward and often ambivalent about its women staff but not entirely because of male chauvinism. Much of the work in the Bank was dull and routine in nature, but the standards of quality, accuracy and efficiency expected were very high. Not very much is said in the book about pay scales beyond a footnote to the effect that they were higher than those of clearing banks, but with the differential declining. Men of the type the Bank wished to employ were put off by the prospect of several years of routine work before reaching a position of some responsibility. Women were naturally worse placed. The worst job of all, that of examining and counting notes, was reserved for them. It was cheaper for the Bank to have this vast and fast-growing work done by lower-paid women and 'young persons', or girls recruited at the relatively tender age of 16. The other female preserves were typing, filing and operating office machines. There were enough women employed in all these jobs to require a supervisory functionary (a woman of course) designated 'Controller of Women Clerks'. Nevertheless, finding sufficient women clerks was a problem. The schools from which 'young persons' were recruited began to advise their better students against joining the Bank. There were other deterrents, apart from the nature of work, such as the need to work on Saturday mornings and—this is likely to amuse many—the absence, in the Bank's 'city' environs, of such facilities as shops for food and clothes "which made life easier for working women".

The war did provide opportunities for women to prove their worth, especially in the Bank's branches where their skill at virtually all the jobs previously done by men was noted "with a faint but perceptible air of surprise". Nonetheless, women did not derive any lasting benefit from the war beyond the suspension of two restrictions, the requirement to quit service on marriage and that to come to work dressed only in plain, sombre coloured clothes.

But women continued to have separate lunch sittings—and they were denied job opportunities at higher levels.

It has to be added that the Bank was concerned about this state of affairs. In 1958, after "five years of almost continuous examination of the problems of the relative positions of men and women in the Bank", a new 'Scheme of Classification' of the staff was adopted. This included a category called 'Classed Staff' which comprised men and women working together under similar conditions of service. But even with this it would seem that women did not get very far very soon. In the most important sections of the Chief Cashier's office known as 'Rooms 1 and 2', where a small group of specially selected clerks finalised the Bank's accounts and analysed the figures, it was only in 1959 that a woman "did the books". This was apparently a landmark event as Hennesy records the name of this woman. She adds "several more years passed before another woman did so".

All these details of the problems that attended the appropriate staffing of the Bank of England illustrate a very significant feature—that there was (and very probably is) no short cut to a high position in the institution and no direct appointments at the top, which meant that a respect for the professional expertise of the Bank of England was a part of the British tradition. The book records the nurturing and development of that expertise through the importance given to staff training, primarily at the instance of governor Coblind. There are a couple of references to discontent among the staff, but nothing else is added. Tensions in personnel relations are largely ignored by the author either because they were not considered serious or out of a deliberate attempt to play down unpleasant events. If the latter is the case, the picture of the Old Lady's domestic situation cannot be considered complete.

At the same time, Hennesy's light touch renders even dull, mundane subjects interesting. For instance, the chapter on Note Issue contains, apart from details of printing, cancellation and destruction of currency notes, an engrossing account of the hassles involved in the issue of a new series. We are told of the tensions that followed the decision to use the 'Queen's portrait on a new £1 note (the first such royal appearance) with sharp differences of opinion between the artist designing the note and the society photographer responsible for the special portrait).

Hennesy is equally felicitous in dealing with more substantive matters. The Treasury-Bank relationship is not entirely outside her purview, though her interest in this subject of perennial relevance is mainly in regard to the introduction of ex-

change control—something of a trauma for the Old Lady. The importance attached to guidance to emerging central banks is described and there is a remarkably clear account of the profitability of the Bank. This includes certain special features (the direct transfers of the profits of the Issue Department to the Treasury and the fact of the profits of the Banking Department being taxable) as well as the ways in which reserves were built up. This discussion brings to light the extraordinary secretiveness that characterised the Bank's relationship with the public, which made the Annual Report of the Bank of England "the dullest central bank report in the world" (R S Sayers quoted by the author). That the Bank had a responsibility in gathering, interpreting and publishing important financial information was accepted only after the Radcliffe Committee reported.

Regrettably, the date of that crucial report more or less coincides with the end of the period covered by this book and the reader cannot help a slight feeling of frustration. In the course of the book the author herself remarks on later changes in the Bank's set-up. Governor Leigh-Pemberton in his Foreword says, "the Bank described here is very far from the Bank of today". He commends the book "both to those who know the institution from inside and to those who know it only by repute". The first category can fully enjoy this purely historical sketch of what the institution was like in the fairly recent past. But the latter category, the lay reader, will keenly miss the absence of an updated picture, especially as it will necessarily have to be a long wait for the next instalment of the official history of the Bank of England. Britain has a thirty-year ban on public access to official documents.

Consent, Agency and Rhetorics of Incitement

Kumkum Sangari

Women's agency or transformative capacity remains problematic in both theory and practice because women are simultaneously class differentiated and subject to the frequent cross-class expansion of patriarchal ideologies.

This article discusses the socially structured and often sanctioned forms of indirect agency in their specific articulation of consent and resistance as significant signs of the ways in which men and women make their history or are inhibited from doing so.

WOMEN's agency being a contextual question there are dangers even in modest generalisation. Nor is any generalisation feasible about Indian women. This essay is confined to posing a few problems about a working notion of women's agency or transformative capacity which may help in more rigorous contextualisation. The centrality of the question of agency for feminists, both in relation to practical organisation and to historical reconstruction, needs little elaboration. Marxist and socialist feminists have worked with a notion of direct agency, at the point of its emergence into self-consciousness and its transformation into collective political will. However, women's agency remains problematic in both theory and practice because women are simultaneously class differentiated and subject to the frequent cross-class expansion of patriarchal ideologies, their agency is not open to historically self-evident modes of collectivisation. I think more attention needs to be paid to the existing definitions and constitution of agential structures for women in order to forge interventionary possibilities adequate to a thoroughgoing politics of change. In this essay I will discuss an area seldom taken into account, that of socially structured and often sanctioned forms of indirect agency, in their specific articulation of consent and resistance, as significant signs of the ways in which men and women make their history or are inhibited from doing so. In order to understand consent, a major impediment to organised resistance, we need to work with a notion of materiality which can extend from minuscule arrangements of daily life to broader features of a social formation as well as work towards a sharper understanding of the differences between the nature of change brought about through individual acts of resistance and through collective, organised resistance.

Feminist recognitions of systemic regularities and 'generic' similarities—both in and across historically and socially specific contexts—have been a poignant and revealing enterprise which have per-

sistently renewed the question of structures. Conceptions of individual or collective transformative agency and struggle are vacuous without an accompanying understanding of their dialectical relation with determining material, epistemic, institutional and ideological structures which they both reproduce and transform. Perhaps structures are best seen as multiple, intersecting, at some levels interactive [Leacock 1981, p 218] and at other levels in dialectical contradiction, and structuration grasped as a continuous, renewing, changing, unresolved historical process. At once determined and determining, the condition and outcome of human agency structures are not a fully fixed a priori—some may be in place, others being evolved by or displaced through the conscious collectivisation of agencies.

I

It may help to begin with two broad definitional tendencies which inflect a great deal of contemporary writing on Indian women, and which have made it difficult to situate, understand or evaluate women's agency. In liberal schemes (often carelessly incorporated into mainstream history of different political persuasions) a historical process which has produced the split between the political and the economic as well as an ideological division between the public and the private as discrete domains, is unquestioningly analysed in its own terms. This has led to conceptually identifying women's agency with direct or conscious political action and with direct participation in the capitalist labour process. Not only does such a conception of agency usually devolve on narrow notions of political or economic participation, but it is based on a devaluation of women's labour and an overvaluation of their social passivity. The work of several socialist and Marxist feminists has shown that the domains of both the political and the economic expand considerably when they are gendered, and has challenged the notion of women being either peripheral or

passive [Etienne and Leacock 1980, p 4]. However, procreative activity, household labour, subsistence labour and other forms of the sexual division of labour are seldom integrated into the political economy. The division of public and private into discrete domains, when taken as an a priori instead of as a changing historical variable functions as a form of obfuscation. The effects of this division at a given historical moment—women's lack of direct access to the 'public' sphere or to direct forms of social action as well as the production of corroborative patriarchal ideologies—are used not only as an indice of women's existing agential capacity but become the theoretical grid through which their agency or emancipation is defined. This not only theoretically reproduces, even reinforces the division, but forecloses a rigorous historicisation of the categories of the private and the public [Sangari and Vaid 1989, pp 10-11]. In practice 'public' and 'private' not only interpenetrate in various, often systematic ways [Jaggar 1983, p 146] but are produced together, connected in relations of condensation or displacement and display different levels of articulation. In this sense the 'private' sphere is a distinct 'political' site for the direct and tangential formation of the gendered subject.

A major obstacle to the theoretical expansion of the political and the economic is the virtual absence of family histories even of 19th and 20th century India, with the notable exception of some field studies, by feminists. Without histories of the articulation of families with political structures and the economy, we can only speculate about the differential ways in which divisions between the public and private have been made both in terms of class and in terms of a sectoral development of capitalism in the past two centuries, the diverse household structures which sustain a specific mode of production, or indeed the nature of the household structures which sustain the complex articulation of surviving and emerging modes of production, the changes in the definition, corporate power

and affective relations of kin groups, the structural changes which occur for women with the insertion of families as a unit of consumption in the market economy and with the introduction of land as private property and commodity, the reorganisation of labour patterns (including the sexual divisions of labour) with individuals beginning to replace family units or kin-based groups, the loosening of family ties amongst migrant labour, or the extent to which the household remains a unit of production thereby giving a different leverage to the 'private' sphere. Apart from the complacent neglect of feminist issues and the consistent evasion of their capacity to alter our understanding of history as a whole, the changing and contingent histories of families have also been neglected because mainstream historians scarcely acknowledge other forms of productive activity or labour outside the designated spheres of artisanal labour, agricultural labour and the working class, and virtually refuse to acknowledge gender differentiation as an integral part of class formation. In the political domain it is becoming possible to indicate, at least superficially, how the state, implicated in familial ideologies, intervenes in the valuation and definition of labour, as well as legally in marriage, inheritance and other areas endorsing and reproducing divisions of public and private. However, at least three significant areas remain obscure: the way at any given time the state changes the wider context in which local and kin-based power structures operate; the degree to which state structures penetrate local power and authority structures and so become involved in the manipulation of marriage, caste or kinship rules; and the range of actions which take forms that are difficult to fit into commonly understood typologies of organised political activity [Moore 1988, pp 131, 179].

On the other side, a side often more alert to feminist issues, an equally narrow culturalism has emerged in which the subjectivities and perceptions displayed in literary or cultural production are projected as the privileged if not sole forms of women's agency. The creative activity of women is not only pitted against an amorphous notion of patriarchal restriction but also posited as a separate transgressive space—a space for overly individualised 'private' resolutions. These resolutions, howsoever worthy of attention and respect, seem to make any direct, collective confrontation of power structures redundant. One problem in such analyses is that patriarchies, themselves seen as either ideological constructs or as a set of more or less customary constraints in the 'private' sphere, become either a

singular or inverse determinant of women's creative activity. Where they are a singular determinant, the other material and historical co-ordinates which suffuse even the formal properties of literary and cultural production are ignored while discursive and ideological constructions are presented as if they operate outside the play of other determinations. Ironically, this only functions to circumscribe the wider social agency of the very modes of cultural production being valorised. The projection of patriarchies as an inverse determinant is underwritten by the curious assumption that patriarchies preclude creativity *per se*. All forms of social inequality undoubtedly block off a great deal of human potential but equally we know that in pre-capitalist social formations, divisions of labour by caste, class or gender produced specialised enclaves of creativity, including artisanal forms, which often made for the 'aesthetic' deepening or enhancement of certain forms of daily labour. A characteristic fallout of the writing within such a framework—which displays different degrees of investment in the 'necessary non-correspondence' of the ideological and the material—has been the naive separation of 'cultural' from 'material' agency, whereas in fact since patriarchies are sustained in both base and superstructure in ways which mark the reciprocity of the two, the material factors which shape women's agency are seldom separable from the cultural forms or practices which embody them. Indeed the issue here could well be that of the ideological determination of women's access to either socially accepted languages for expressing or political modalities for constituting individuated and collective interests.

A related tendency is visible in reviews of the spheres of 'power' reserved for women in 'traditional' and 'semi-traditional' societies like ours. Quite apart from the frequent rehash of the tradition-modernity binarism, here such spheres are read as signs of women's agency or as spaces for their subjectivity within recognisably unequal societies, or even as signs of the transgressive excess by which women escape being fully contained by social structures. Though often written from avowedly anti-enlightenment or anti-colonial positions, they display an inordinate and helplessly 'modern' respect for 'traditions' in a country which is both renowned for its many coercive and oppressive traditions as well as rich in lesser known strands of irreverence. This contemporary reverence for transgression and alternate spaces, howsoever feminist in its orientation, leaves little space for making alternatives outside traditions. Further,

this reverence is but a short step away from interpreting women's access to all forms of power—even in conservative, indigenist or right wing formations—as self legitimising and/or inherently subversive. In political terms it amounts to a capitulative tendency and that too in a characteristically 'feminised' mode, i.e. working through a play of compensations. Transgressions or subversions can perpetuate power structures unless they are linked to other collective, confrontative, radical forces of change.¹ On the whole, in evading the precise social content and ideological location of these valorised spheres of female 'power' and so of their subversive potential, this tendency implicitly refuses to recognise how patriarchies function.

Patriarchies—I use the term broadly to denote systems of subordinating women—function simultaneously through coercion or the threat and practice of violence, through making a wide social consensus drawn from and dispersed over many areas of social life and through obtaining in various ways, different degrees of consent from women. Women's agential capacity within so-called 'traditional' societies and accompanying discursivities may actually be one of the ways by which consensual elements in patriarchies are often made—for unless certain distributions of power are made within patriarchal arrangements it is difficult to imagine how any degree of consent from women can be obtained.²

II

In the following paragraphs I will sketch a working notion of patriarchal systems within a class differentiated social formation—referring only to patrilineal, patrilocal and not to either matrilineal or tribal systems. My emphasis will be on consensual elements which are usually neglected but are important in building an understanding of agency and my attempt will be to shift the locus of consent from victimisation and/or the ideological misperception of their own interests by women to the wide social processes in which patriarchies are embedded.

Women's agential capacity is distinct insofar as women are subject to the determination of patriarchal structures.³ Patriarchies are resilient not only because they are embedded in social stratification, divisions of labour, other political structures, religious/cultural practices, institutions and categories, but also because of the contractual and consensual element in them, which along with patriarchal systems is open to constant and consistent reformulation. These elements, stretching across a continuum from acquiescence or passive acceptance to active collusion,

need to be analysed not only as produced through the coercive and ideological operation of patriarchies, but also as specific articulations of patriarchal ideologies and material factors: the bases of these elements, which lie in the social structuring and particular material base of a patriarchal system, also seem to inhere in the very mechanisms of its reproduction—a process to which women are subject but of which they may also be agents. The persistence of these elements may have some connection with the fact that the modalities of the reconstitution of a patriarchy work through both overlap and reformulation: over a period of time, its various constitutive elements may have different durations and tempos of change. Women's consent is neither an essential nor a historically frozen category, but a part of this uneven process of the reconstitution of patriarchies.

The question of consensuality is a complicated one. Since patriarchal systems are linked to others, neither the consent nor the resistance of women can be interpreted as a manichean drama with an enveloping patriarchy alone. So when women accept, consent to, are complicit with or invest in patriarchal values, practices or arrangements, it need not be construed as consent to these alone since the patriarchies they are subjected to are simultaneously located in specific modes of production, in class structures and in particular forms of caste-class inequality. Conversely, patriarchies help in inculcating an acceptance of social inequality in different historical periods and in making structures of deference which are wider than the relations between men and women. In other words, patriarchies are not only laterally related to other structures of legitimisation but enter the wide dialectic of social legitimisation needing commensurate broad-based forms of collective resistance. (However, while patriarchies are variously related to other structures of social inequality, they remain distinct and are not collapsible into them.) Though the relation between classes and patriarchies is complex and variable, being both direct and indirect, and class formation and social differentiation are themselves uneven and contradictory processes, even so women's consent or investment may extend to those structures in relation to which that particular patriarchy operates and is open to a class differentiated analysis. Further, consensual elements may either be garnered from without or honed from within patriarchal arrangements. Consequently, the problem of evaluating the hegemonic power or social effectivity of a so-called determinant is knotty, entangled with many other questions about the role it plays in the

reproduction of patriarchies and other related structures, as well as about the nature and degree of the articulation of particular patriarchal structures with others. I would go so far as to say that just as the conditions which govern women's consent are wider than patriarchies, so women's consent may itself be one of the nodes of the condensed articulation of patriarchies with other social structures in specific historical conjunctures.

The means by which a degree of reciprocity is established for consensual and contractual elements in patriarchies may be both material and ideological; careful analytic distinctions would need to be made between consent resting on material arrangements which guarantee women rights, compensations or protection ((despite the usual asymmetry between rights and obligations), consent resting on ideological ensembles which offer at best precarious, at worst illusory rights, compensations or protection, and consent resting on forms of coercion which push women towards normative behaviour.⁴ The consensual, contractual elements combine agential power with subjection for women and produce a mixture of consent and resentment. They would seldom produce just consent. Nor is there anything straightforward about the element of consent since it may rest on a series of factors ranging from wide social consensualities, economic dependence, social pressures congealed into structural necessities or dispersed as moral systems, the pull of affective relationships and the perceived legitimacy of the offer to protect women from the patriarchal violence of other individuals or groups. The particular articulation of consensual and coercive elements within patriarchal systems would also be shaped by a range of other factors including the nature of women's access to resources and insertion into the labour market as well as the interplay between women's productivity or participation in 'recognised' forms of labour and in 'invisibilised' forms of labour. Even so women's implication in the contractual, consensual elements of a patriarchy, not only puts them in a contradictory relation with that patriarchy itself but also tends to situate their social agency in fairly contradictory fashion as both complicit and transgressive. There is not much to be gained in valorising one term over the other, both need to be seen in relationship to each other and to the reproduction of any given ensemble of social relations.

A class differentiated analysis of consent would need to bear in mind that while patriarchal arrangements differ, and sexual divisions of labour occur within a

specific set of social relations, patriarchal ideologies have more fluid, permeable boundaries. Women from the propertied classes or the upper layers of social hierarchy should especially be looked at in the full range of complicities and extracted compensations. Women may often derive their class status from men but they conjointly live out class relations and participate in their reproduction. They share to some extent the structural capacities derived by the class as a whole by virtue of its position in the relations of production. The modalities of their oppression deny women from the upper and middle strata many of their interests and rights (both *de facto* and *de jure*) but do they deny all those which accrue to a class? Does their consent rest on the pincer logic of bondage produced through caste-class affiliations and privilege or power exercised over others? We have to think quite seriously about the class, caste and communal assertion which is built into patriarchal norms, as for example the good wife in middle class domestic ideology, or the chaste upper caste Hindu woman. Both carry a set of aggressions and are not as innocuous as they seem. In other words the question here would be about the forms of social agency which can accompany normative patriarchal ideologies and the degree of customary or class or otherwise institutionalised power they provide some women over others—whether men or other women.⁵

Women from the labouring classes, who broadly speaking are not in a position to exploit the labour of other individuals or classes, are subject to different patriarchal systems, though some aspects of these are structurally related to the patriarchal practices and ideologies of the upper strata; their 'consent' is nuanced differently, often even centred on the facts of their wide-ranging social subordination. Tied to the family unit in an economy of survival, subject to the coercive patriarchal practices of their own class as well as to the exploitation of their labour and sexuality by upper strata, women's 'acceptance' is poised at the nodes where at least two contradictions are at their most acute: that between the economic and ideological dimensions of the family as well as that between the myth of the responsible male protector-provider which men are either unable or unwilling to live up to and the reality of women's labour as being an indispensable and sometimes primary source of the family subsistence.

Given the complications of consent, our starting point could well be to formulate the questions which are latent in just this insistent, structural pressure produced by women's contradictory location in patriarchies: who or what women's

THE PAST DECADE : HIGHLIGHTS

- **Business grows annually by 28 percent**
Loan sanctions increase by 28 per cent
Disbursements increase by 32 per cent
Loan outstandings increase by 30 per cent
Guarantees issued increase by 23 per cent
- **Export bids increase annually by 50 per cent**
— Export bids approved aggregate Rs. 50,000 crores (approximately).
— Export contracts finalised aggregate Rs. 6500 crores (approximately).
— Exports to 60 countries.
- **Export markets, products diversify**
— New products: Design, manufacture, supply and commissioning of gas turbine generator sets in Malaysia, an example of a turnkey project, civil construction work of laying 211 kms pipeline for

- transportation of petroleum products in Indonesia, an example of a construction project
- Service contract for operation and maintenance of a cement plant in Saudi Arabia
- Printing machinery and silk designer garments to USA, tissue culture plants and studded jewellery to Japan, hand made carpets and dried flowers to EEC, examples of product exports
- **Components of our strategy**
— Competitive finance for product development, investment capital, export vendor development, export marketing and term export credit
— Export advisory services
— Analytical research on markets and export opportunities.

All a part of a composite strategy.

agency is on behalf of, the quality and precise nature of the combination of power and subjection, the cost of either such power or of subsistence within compensatory structures for women. Do we want them at all? Are all modes of empowerment for women equally desirable? Do we prefer to define ourselves not merely as we are but also as we would wish to be? Are the rights or compensations on which consent rests structurally available to all women of that group or to some? How would collective struggle effect them? How far do contractual and consensual elements persist because of the absence of external support structures for women and how far do they actually inhibit their formation?

As far as the question of the contradictory structuring of women's agency within families is concerned I think analyses need to be reinflected in at least two ways. Firstly, we need to attend to the gap between familial ideologies and the family as a social entity or a concrete constellation of relationships and resist the tendency to read the desired ideals of familial ideologies as the existing structure and organisation of households at any historical moment [Coontz 1980, p 13; Moore 1988, p 117; Barrett 1982, p 85]. Given the plethora of ancient and modern prescriptive texts which have functioned as modes of ideological homogenisation disguising both the contests undertaken and the actual heterogeneity of family arrangements, it is misleading to read prescriptive texts as unproblematic descriptions of family forms: familial ideologies are not reproduced mechanically in the family as a material institution.

Secondly, families need to be seen not merely as an undifferentiated site of women's socialisation and oppression but also a site of struggle and of the daily recreation of inequality in which women participate. In at least the 19th and early 20th centuries, class formation and emergence has not been tantamount to class solidarity; given the range of intermediary strata between direct producers and the state, horizontal affiliations have continuously been made in part through reconceptualising the family as a social unit, a unit for the social reproduction of caste and class inequality. From the 'middle-class' writing of this period, there is evidence not only of the contentious relation between existing or emerging ideologies and actual household arrangements but the family also appears to have been a self-conscious arena of heated battles about the regulation of sexuality, the definition of gender roles, control over marriage and reproduction. At the same time, familial ideologies—compounded of romantic love, female nurturance and self-sacrifice, masculine protection and finan-

cial support—were becoming a way of distinguishing between classes. With upward mobility being uneven, significant differentiation emerged within families even generationally: there is ample evidence of the differential enactment of class as a relation by individuals within a family—in nuclear units identifying with wider kin networks, in extended families, and in the nucleated units of semi-extended families. Different external class locations being played out by individual members within a family surface in memories and descriptions of conflicts, rivalry, shifts in power, resentment, and were sought to be resolved in a fixing of status through various kinds of family narratives. Further, in these narratives individuals appear as the complex bearers of past, emergent and desired class positions. How were women located in such intra-family class divisions? What was the nature of the contradiction between the moral onus on women to hold family units together and the actual suspension of morality in such friction or abrasions within the family? One facet of this may be the evident struggle over control of available resources. Women seem to have been as much a party to this as men especially where household resources were concerned. The politics of the household seem to be structured according to the degree of access women have to patriarchal power (as for instance the mother-in-law), in the form of some control over the redivision of household labour among women—daughters, daughters-in-law, unmarried women and especially widows, over marriage alliances, over sons and in other forms accruing from an acceptance of delegated or surrogate patriarchal roles which included the surveillance of other women. Not only did these produce tension among women but ensured that in family situations women were only able, if at all, to form an uneasy collectivity. Is it that consensual elements in patriarchy functioned to divide women both within the family and in a broader sense? Did the struggles within 'middle class' families for power open avenues of 'compensatory' power for women though they seldom altered their position in other ways? Did the invisibilisation of women's household labour also push them into compensatory structures? What was the precise nature of the articulation of affective relationships and material factors in families as well as the nature of the bonding which took place across this range of contradictions?

III

The question of feminist historiography is an extensive one and here I will discuss only a few aspects related to agency and consent.

The historical constitution of notions of 'female agency'—as offered cultural abstractions—have an especial bearing on the problem of historical reconstruction and constitute another reason for discarding the simplistic notion of a woman acting for 'herself'. Who is she? So thoroughgoing is the social constitution of notions of femaleness, self or identity, that the question of women's agency is inescapably linked to or determined by other available histories—family, class, religion, other existing notions of moral order, extant modes of individuation and collectivisation. With patriarchies being tied into cosmological or bourgeois moral notions, women's consent may not always be instrumental or 'rational'.

The question of dispersed social 'identities' also arises; women's identity like other social identities need not be sought along a single unified axis. It may be useful to interpret multiple identities through several crises-crossing ideologies rather than a single one. However, these multiple identities may exist, not as atomised entities but in significant relation with each other at other levels of the social formation, especially since hegemonic ideologies may themselves operate at different sites.

One problem of historical reconstruction then hinges on understanding the particularly complex relation which obtains between social practices and representational forms. Since patriarchies function in and through relations of production and divisions of labour as well as through diverse forms of discursivity, the material and discursive are mutually implicated—but there is no single relation between the two. Material and discursive modes of constituting women's agency may coincide or conflict. The connection between the material and discursive may not always be open to direct description; it may be more available through the contradictions and consensualities generated, which serrate both offered ideologies and enacted agencies. Indeed, the peculiar emphases of consensualities is one way of marking a possible or latent contradiction. For instance, prescriptive condensations and narrative elaborations play out consensualities in different ways. Prescriptive texts may be as much histories of dissent and social contests—since patriarchal ideologies too are formed through processes of social contestation—as of hegemonic ideologies and achieved cohesion. Their desired ideals are open to being measured against the social 'imperfections' or 'aberrations' which they seek to contest or eradicate, and they require sustained analysis as thematised, mediated, often contradictory documents. Further, though they function as pressure, offered prescriptions and ideologies, however

stringent, are seldom identical with enacted agencies or the actual range of possible choices.

Nor can a straightforward opposition between prescription and agency be maintained. Rather, for feminists it remains important to see women as evaluative agents, even as simplistic and essentialist notions of women are rejected and a sense of how deeply women are embedded in ideological and epistemological structures is retained. Even when evaluation is not articulated or part of an explicit political, collective self-consciousness on the part of women, there may be an implicit evaluation of patriarchal structures acting as both horizon and limit (enabling certain forms of agency while restricting it in other forms), as well as of the forms of agential power available or denied within patriarchal consensualities.

Narrative elaborations, each bearing their own social and formal histories, refract, work out, extend or repress potential social agencies, they can play a significant role in making relationships between offered and practised agencies, re-entering the latter into evaluative systems of ascription and so may even attempt to refold widening social agencies into normative modes. Narratives themselves need to be evaluated in a matrix of social practices, especially since they may, situationally acquire direct agential roles. Perhaps the degree to which a narrative or prescriptive unit (or for that matter any particular structure) is implicated in both base and superstructure, will effectively increase its capacity to determine, as indeed will the degree to which a particular structure is dispersed in the social realm as well as over time as a culturally consolidated or sanctioned unit. That is why in looking at the sedimented histories of prescriptive and narrative forms, an understanding needs to be developed that they bear not only the histories of patriarchies but of many different social tensions.

The co-ordinates of women's agency need to be established—the conditions of possibility, of proscription, of loopholes, of contradictions—before racing to conclusions about it. How is agency being defined or redefined at that moment—in the range of material factors, historical circumstances and ascription? A transitional historical moment, for instance medieval bhakti or the 19th century, may open possibilities unforeseen in 'discourses' alone because of social disjunctures, the inconsistencies, or even schisms between women's agency as it is represented and as it is practised, the qualitative shifts in the historical constitution of volition, subjectivity, female knowledge, and the changing relation between moral strictures and affective structures [Sangari 1990,

1991]. The conjunctural sites of underdetermination are also of some importance: the points at which agencies slip through structures—in new situations, at transitional moments or in liminal areas; those factors which allow individual women to act differently, independently or even contrary to the demands of structured relationships; and the situational ability of individuals to act against their own immediate interest to maintain structured relations of collective power—e.g. family, caste, community—leading to complicated forms of 'self' oppression and/or oppression of others. In each reconstruction the delicate and variable relations between ideologies and agencies comes up.

Historical reconstruction then becomes a matter of provisionally eliciting structures, through the aggregation of actions, events and agencies, of narrative, prescriptive and other discursive genres and performative modes, of divisions of labour, mechanisms for the generation of surplus and the distribution of resources, family forms and households arrangements, and so on. Through the juxtaposition, collisions, contradictions of these not only could practised agencies be reconstructed to some extent, but a recursive relation between structures and agencies may be tentatively established.

At one level, 'structure' is an approximation through analytic abstraction, a cognitive grid of a social terrain more complex or dense than the sum of structures which may be seen to constitute it. Not only may a social formation contain a subjectively valid underlife of forces and events for which there may not be decisive evidence, and where the nature of these events or forces may preclude even immanently objectified traces [Brown 1986-87, p 158; Kaviraja 1989, p 36], but there may in social practices be inflections, asymmetries, interpretative possibilities, cultural densities, a range of actions and choices available to individuals which cannot be mechanically read off from structures. The scarcity of information (which accompanies the history of all but ruling groups) compounds this problem of historical retrieval for feminist historiography. Feminist historiography then exceeds normative rules of evidence, looking, as it must, at the frontiers of articulation for the props of patriarchal structures.

IV

Symbolic attribution, social ascription, ideologies and narratives interact in an emphatic way in maintaining the sexual division of labour and in structuring women's reproductive role; this combined with women's marginality in the

ideologically defined 'public' sphere, has often pressed the practised and ascribed agency of women into convoluted shapes, into shifting and displaced intentionalities. Social discursivities in turn have been important in determining the cultural forms which these convoluted agencies will, can or should take.

An interesting narrative unit of convoluted agency, female incitement, is dispersed in many social spaces as well as across time; it occurs as biography, autobiography, orality, cinematic type, political discourse of nationalist and now communal parties. The instances are numerous and many are common knowledge, from Surupnakhā, Manthra and Kaikeyi in the *Ramayana*, Kunti, Vidula and Draupadi in the *Mahabharata*, to numerous Rajput women in 19th and 20th century narratives and now to party ideologues like Sadhvi Rithambhara. A history of the proliferation and change of this unit in different 'formal' structures, its crystallisation as a culturally consolidated or sanctioned unit, would be an undertaking in itself. I will discuss it here, very briefly, not as an illustration of the foregoing discussion but only as a way of raising further questions.

Female incitement—women calling upon men to act—is a politically charged discursive unit which marks the entry of women (who may sometimes be under threat of sexual violation) into surveillance of a male 'public' domain by calling paternalistic patriarchy to account in recognised forms of surrogate action, or it may even mark the entry of women themselves into the 'public' sphere. It may exist at the tense interface of agency as it is ascribed to or proffered to women and as it is, often within these terms, represented in narratives or taken up by women in their lives and used, often unsettlingly, in ways which may reproduce or transform it. Incitement exists at the intersection between the 'political' and 'domestic', between gender relations and other power relations, occupies an uneasy boundary between the respective logics of women's consent and resistance rearticulating their relationship in different ways.

If, as a convenient entry point, a generalised semantic is extracted, it reveals three related features. First, that women share the values for which men are being incited and have a stake in the social relation which is sought to be preserved. Second, that they cannot act independently and directly on its behalf but must act through men: they can be the active custodians of those values and social relations but they cannot usually take action (generally militant or public) themselves. Third, that if incitement is to carry an inspirational connotation, women must

never name the social relation they are trying to preserve or present it as a personal or material interest; they can only name the abstraction—family, honour, religion, nation—to which that social relation is either directly attached or which mediates it. If women name it (or rather give it no other name?) and/or state their own personal stake in it, then it acquires a malignant connotation: they become status-conscious materialists, conniving intriguers, women leading men astray, wicked manipulators.⁶ In the naming and the not naming resides the distinction between villainous and heroic inciting women. Since men are usually perceived as having both rights and duties, while women as having primarily duties, any claim to 'rights', unless effectively disguised, becomes a sign of women's evil nature. The same structures which push women into forms of convoluted agency also produce or ratify misogyny, in this case as systems of representing and characterising that agency as malignant. Though both 'good' and 'bad' inciting women reflect a consensuality of values, the distinction between them also rests on the fact that in relation to both the constitution of social values and of material structures of inequality, patriarchal structures are part of a connected series. 'Undisguised' material or personal interests can be designated as illegitimate or malign female agency because by taking recourse to these women may interrogate or 'expose' not only the material bases of a patriarchy but also of a large number of social values, endangering the entire dense imbrication of patriarchal structures with the other related social structures. Conversely in its inspirational forms it can be legitimate—even be a sign of female strength—because it may actually assist in either integrating patriarchies with, or reformulating them in relation to, other ideological coherences or consensualities, for instance, those of 'community' or 'nation'.

At another level the inciting woman may represent a temporary control over male sexuality: she is putting male honour—ineluctably tied to male sexual potency and to the protection of women from sexual violation—at stake. Though she relies on a consensual value structure—at that moment she may stake male sexuality in a way calculated to wrest consent. For instance, if at that moment the man does not want to go out and fight, he will be branded a coward. Here a woman is exercising some situational control over a man's status (in a masculinist hierarchy) by laying him open to social castigation for being unmanly. She can through setting up a structure of incitement—which polarises success and

failure—effect his social standing, insist on patriarchy as a structure of public accountability and so throw it into jeopardy. At this level incitement may be poised at moments of the perceived breakdown of the reciprocal, consensual element in patriarchies. It gesturally ties men down by invoking the potential humiliation of publicity (a mode of redress?), temporarily denaturalises patriarchal arrangements by displaying them as social and contractual and points at the precariousness of the guarantees offered to women by contractual and consensual patriarchal elements.

I would suggest that because incitement involves an exercise of power from a 'dependent' position that it is socially 'dangerous' for those men, whether as individuals or as groups, against whom it is exercised. Therefore it becomes acceptable if women incite in the name of something else, even when they represent themselves as victims, rather than if they incite in their own name. It is also on this issue that the line between benignly inspirational and malevolent female agency is drawn. Though the good woman inspires and the bad merely incites, the semantic structure is the same. In one she becomes the excellent custodian of value, in the other wanton with male sexuality and replete with self interest, even though she may be risking men in both. Ironically, since women suffer from the successes of a patriarchy and also from its breakdowns (especially of protection from other men) the stake in 'inspiration' is double-edged. Inspiration builds an ego, incitement threatens symbolic castration. Both produce social guilt, the one from transcendence, the other from 'exposure'. Both are agents. In practice of course the line between the two may be thin or fluctuating.

Any instance, such as that of Manthra and Kaikeyi in the *Valmiki Ramayana*, even when read cursorily, is considerably more complicated than the generalised semantic described above and raises its own specific set of questions. The contested nature of socially approved languages for embodying the interests of women, definitions of individual agency and of 'character', the nature of institutional forms, interpretative schemes and tacit consensualities which structure the episode of incitement are difficult to contextualise since the epic covers a protracted period of centuries and an extended even variable social space. Given the growing emphasis on chastity for women and the accompanying emphasis on primogeniture which is still contested as a norm, substantial alterations of social configurations, the transition from lineage-based systems to monarchical states, the shifts in sources

of authority and of legitimation, the epic's incorporation of a whole continuum of social and economic forms [Thapar 1986, pp 147, 362-64], the different co-existing forms of marriage, the implied shifts from matriliney to patriliney [Chakravarti 1983], and the traces of polyandry among the Ikshvakus and the vanars which exist in the epic [Singh 1988, pp 139-44], how do we begin to conceptualise the reformulation of patriarchies and the shaping of convoluted agential modes for women? Are these produced through the contradictions of these transitions as they are encapsulated in the epic which compresses several layers of time?

The signal omission in the episode of incitement is any reference to Dashrath's promise to Kaikeyi's father in a bride-price agreement that her son would inherit the throne.⁷ Whatever its historical coordinates may prove to be, the omission functions ideologically: as a transmutation of contradictions, shifting the coherence of the narrative from women's customary or contractual rights to women's marital obligations. This structuring evasion controls the reception of the epic: it delegitimises and villainises first Manthra then Kaikeyi, makes a 'victim' of Dashrath and inflects both the evaluation of the 'character' of the inciting women as well of the mode of redress they plan. Though the bride-price agreement simply does not enter the chain of causality or sense of motivation in this episode, in the early part of the 'Ayodhyakhand', it is not fully suppressed. It lurks in the conspiratorial air about the coronation: Dashrath in his haste omits to invite Bharat, explicitly tells Ram that it is better to have it in Bharat's absence since Bharat may begin to entertain evil thoughts and cease to be the good brother he is at present and tells Kaikeyi after telling his other wives and after the entire city has begun its preparations and crowds have collected, thinking that she will not know since the news has spread only that day. All of these amount to a subdued recognition of Bharat's claim to kingship. Almost at the end of the 'Ayodhyakhand', when the bride-price agreement is mentioned by Ram, it is in order to persuade Bharat of his eligibility for kingship! It is given no weight as a causal event. Ram does not say anything about Dashrath breaking his promise or anything to exonerate Kaikeyi. His brief, bland description neutralises the significance of the promise, impeding its social proliferation, deflecting the energy encapsulated in Kaikeyi and Manthra to disrupt desired social harmonies.

Manthra, Kaikeyi's nursemaid from her natal family, appears to speak the language of material interests: she implies

that Kaikeyi's son Bharat has an equal right to the kingdom and should have been given at least half of it; Ram's coronation will mean a final disinheritance since only sons inherit from fathers; Ram is selfish and once crowned will be vindictive enough to exile or kill Bharat; Kaikeyi, the proud, beautiful sexual favourite of the king who has spurned her senior co-wife Kaushalya will find her status changed since Kaushalya as Ram's mother will not miss the opportunity for revenge; the status of Bharat and his wives as well as the fortunes and suffering of Manthra are tied to Kaikeyi, and will be downgraded along with Kaikeyi's own who will now have to serve Kaushalya. Manthra peels away Ram's ideality—which the larger design of the epic obsessively establishes since his goodness is a validation of his right to kingship—calls Dashrath ungrateful, hypocritical, the betrayer and enemy of Kaikeyi, perceives the domestic situation as inherently conflictual even factional with Ram and Lakshman ranged against Bharat and Shatrughna. For her both fraternal and polygamous relations are the inevitable site of 'fission'. Her challenge to all forms of ideality goes against the grain of the epic.⁸ The epic in turn is unequivocal about her wickedness, she is described as the producer of 'vishaad' (sorrow), 'bhed bhav' (dissension) the 'paapdarshini' who leads Kaikeyi to the road of sin. And yet even such a Manthra does not bring up the bride-price agreement. Is the unstated the assumed of consensuality, the inertia of common sense or does it exist at some frontier of articulation as the unsayable, even the unthinkable?

The plan hinges in part on what seem to be customary modes of expressing anger, presenting a grievance and seeking redressal or almost routine features for 'framing' women's discontent—the shedding of finery, the recourse to a display of suffering in an established 'krodhagar' (literally abode of anger) extracting a promise from the king before asking for the boons. One verse sympathetically describes Kaikeyi's lying on the floor as the action of an able or helpless woman, who has taken the only form of action available to her. The 'krodhagar' speaks of an externality, assuageability and excess of women's emotion—women require theatres to play out emotions; as an institution which acknowledges polygamous relations as problematic, it organises the release of emotions at the point where they impinge on the domain of the king and state, but in a place which is still private and contained.

Manthra understands material interests as material (in contemporary vocabulary

as rights); however, she does not advocate that Kaikeyi claim them as such, but rather as boons granted in return for her two earlier acts of bravery in saving Dashrath's life on the battlefield. Once she has made the plan her own, Kaikeyi adds to it a vow that if balked she will starve herself to death in the *krodhagar* and later also uses the language of 'dharma' with Dashrath and Ram.

Why does a 'right' or justifiable claim change into a boon? What are the realities of the social world which the epic refracts? Is it that since Dashrath has already broken his agreement with her father and fixed Ram's coronation there is no likelihood of his changing his mind? Or is it that he cannot publicly reverse his decision except under stronger pressure? Or that only fathers and not daughters can enforce bride-price agreements? Is a boon a consensual method of redress and the only way to counteract male deception? What is the nature of women's access to a language for expressing individualised interests in relation to the power of emerging prohibitive systems of moral classification? Is it that a king's boon is coming to acquire more social legitimacy than a woman's right in the emerging language of dharma which Ram seeks to establish and Manthra and Kaikeyi use this knowledge?

The semantic of the boon itself forces us to reconsider what agency may mean here. A boon, granted for good deeds or behaviour (bringing in the huge question of the social constitution of morality) is a highly personalised, legitimate way of gaining power. So for Kaikeyi a boon could signify merit earned in her own capacity rather than as daughter given in a bride-price arrangement. As merit earned it may even be perceived as a special, unique yet enforceable right. The boon, though non-contractual, rests on a tacit mutual agreement in which the giver, in a position of power relative to the grantee, must obey his own generosity. And if the content and terms of the boon are not specified by the giver, or specified in the grantee's request at the moment of granting then it becomes a *contenti unknown* boon making the giver quite vulnerable—he does not know what he will be asked, he cannot withdraw without losing face, the sense of his own munificence or perhaps even his power to grant.⁹ However, for the grantee a deferred boon becomes a way of covering any future contingency which may arise: Kaikeyi describes it as *dharohar*—trust or deposit.

Finally, unlike a boon asked from the gods, a boon asked from a king would have to be commensurate with his capacity to give: it would occupy the material domain of resources under his control or

fall within the purview of his political power. Though a king's boon recodes 'rights' as favours or as bounty, it may be the only way open for a subject to express her will in relation to the king. Kaikeyi's convoluted agential mode, based on an understanding of hierarchy among women in the palace, may after all not be all that indirect. She can and has been refused a 'right', but she cannot be refused an already granted boon, unless Dashrath undoes his kingly status and sacred appointment. And yet what if this understanding is based not merely on the internal semantic of the boon but on the fact that the social location of the boon itself has changed from the time when it was granted? An astatic, non-contractual, personal transaction, an unequal exchange, arbitrary in the sense that it is embedded in its own codes but not governed by enforceable social laws is sought to be encashed at a moment when the failure to grant the boon would now be involved in a dangerous ideological delegitimisation of the state—a state hinging on contractual rights and obligations towards a choric, faceless 'praja' (subjects) encoded as dharma and 'satya'. Is the bride-price agreement redundant in the changed context? Are Kaikeyi and Manthra investing in the new order for their own protection, but uncertainly using a mixture of old and new methods?

Is that why for the boon to be honoured it has to be shored up, even encircled by a promise on one side and a threat of suicide on the other? All three appear to draw on existing and emerging structures of public acceptability. The three levers—the promise, the boon and the threatened suicide—draw respectively on the power of the favourite wife's withheld sexuality, the dharma of a king, i.e., a structure of public arbitration, and making grievance public while placing the burden of guilt on the king. The first, a form of sexual coquetry—the withdrawal of favour—builds a context for asking—based on the only personal form of leverage Kaikeyi has.¹⁰ The latter two rest on the application of moral pressure and production of guilt in a situation where she has no access to political power and also play on Dashrath's own repeatedly expressed fear of public perception and the opinion of other men. It is this fear that makes him recast his desire for Kaikeyi as a sign of weakness. There is an element of misogyny in the public opinion which acts as a virtually juridical pressure on him; the recurring description of Dashrath as transfixed by the spell of 'kaam' (carnal desire) ironically confounds desire and dharma—the very existence of *kaam* falsifies dharma. Kaikeyi's threat of making his breach of promise public by telling

the 'rajishis' could imply either an earlier notion of woman's customary right or a new system of public arbitration of a king's dharma. Indeed there is an uneasy relation between male authority and male obligation visible in the customary and evolving modes of redressal.

The tense relation of Kaikeyi with emerging 'rules' is evident, she is complicit with them in one sense but not 'knowing' or compliant enough in another. She argues in the name of abstractions—'satya', men's dharma, clan honour—in order to hold the weakening Dashrath to his word and later to put the onus of preserving or salvaging Dashrath's dharma on Ram. This enables her to taunt and fasten Dashrath and Ram to their self-representation, but does not prevent her from being villainised. And that seems to be because she has not learnt a corollary rhetoric of self-characterisation—'naridharma' (woman's duty)—which may be an emerging mode of negotiation based on an apparent 'exchange' of rights and obligations. Sita and Kaushalya self-servingly confirm nari dharma, play it as the basis of conjugal affectivities, mimic Ram in ideal self representation and in displaying virtue.

Indeed naridharma is presented as a possible resolution of the running contradiction between patriarchal dharma and women's agency: unless male dharma is accompanied by female self-abnegation, its values cannot be socially ensconced. Ram tries to resolve this contradiction before leaving for the forest, telling first Kaikeyi, then his mother Kaushalya, who is claiming extreme ill-treatment by her husband, to remain as a 'pativrata' should with her husband and asking Dashrath to show greater respect for his mother who has proved her virtue. He tries to establish a reciprocity between male duty and wifely virtue. Female incitement partly serves to set up a rationale for the necessity of naridharma. With Kaikeyi as foil all the other wives of the Ikshvakus not only appear good but become self-righteous while two different rhetorics and modes of presentation, one externally planted and the other internally experienced, assist in making a villain of Kaikeyi and a victim of Dashrath. Kaikeyi's is a coached performance, while Dashrath's is a spontaneous outburst. Since the bride-price agreement is never mentioned, her motives are reduced to domestic jealousy, fear of lowered status, an almost arbitrary cussedness, a product of mal-tutoring. Dashrath presents an exhaustive range of reasons, both 'public' and 'private', is humanised as a nearly tragic, broken old man, torn by irreconcilable truths. The power of Dashrath's anguish becomes an argument against women's agency, pitting his suffering and proclamation of her

guilt against her demands. The mode of presentation magnifies her crime: Dashrath's anguish and pleading, the descriptions of the goodness and beauty of Ram, the expectations and congratulation of the crowd and of other women offered to Ram, Ram's rhetoric of filial obedience, Kaushalya's anguish at hearing the news of the exile, the description of the luxury of the palace Ram must forsake for the hardship of the forest are interleaved at great length with Kaikeyi's stubbornness, her disobedience and lack of doubt. Similarly Dashrath's silence puts the onus of telling Ram of the decision on Kaikeyi. She is left only with the coldness of a stance, everyone else suffers, has emotions. No one mitigates anything for Kaikeyi. Eventually she becomes the object of everyone's hatred and anger.

One latent contradiction is that a boon granted to her in the capacity of a wife who has been extraordinarily 'good' and courageous, is sought to be encashed as a 'mother' securing her future when Dashrath's 'grihashthram' is about to end thereby shifting the locus of exercising power in a way which dramatically opposes husband to son. Bharat's rejection of his mother—a denial of an affective, primordial bond—functions as a statement that wifedom and motherhood should *not* contradict.¹¹

Ironically, the epic in fact highlights the precariousness if not failure of male protection and the way it interacts with dependency: women—neglected, deserted, rejected—cannot rely fully on the protection of the kin group while protection and even reciprocity from a husband is uncertain.¹² At one level protection seems to be given only if the wife is good. But even obedient wives lose out as with Kaushalya and Sita.¹³ Despite its anxiety to establish male ideality, the contradictions are not resolved in the *Valmiki Ramayana*, both Dashrath and Ram die of grief.¹⁴ If protection is to be a part of the contractual element in patriarchy then it is not fully in place. Is this because protection conflicts with dharma, duty and public consent, i.e., with other social forms of consensuality which are simultaneously sought to be instated? Or is the epic showing not the failure of protection, but establishing, somewhat inconsistently, the conditions under which it can work?

Women themselves seem to have different degrees of investiture in the old and the new; involved in the reformulation of patriarchy, they use and waver between two different axes of consent. The definition of women's agency is also problematic both in relation to the mythicisation of the plot and the individuation of character. The convoluted agential modes of women interact with direct male

political agencies to propel the plot. Is this a trace of an earlier, more dispersed form of decision making among men and women, being reinterpreted in a new morality of the good wife and the new centralisation of state power in men? In the later Vaishnavising interpolations in the *Valmiki Ramayana*¹⁵ the events acquire the additional gloss of being preordained. Character exists at the ambivalent node of two different causal sequences—motivation and preordainment. Yet if Kaikeyi and Manthra are also serving the purpose of the gods in assisting Ram's preordained task,¹⁶ then why the severity of the condemnation? If Kaikeyi and Manthra set in motion a whole series of events starting with Ram's exile and his mythic deification which are however an offshoot of Kaikeyi's presence on the battlefield, then how do we define public and private? Does this device signify the 'domestic' origin of a massive myth of male valour? Or did women's agency have both political origins and consequences though its own modes and the changes occurring curtail social acknowledgement?

The individuation of agency is also problematic. Since Manthra incites Kaikeyi to incite Dashrath, in one sense they form a single agential unit. However, the relation between the two itself appears to form a set of mutually displaced agencies. First Kaikeyi is presented as good until 'converted' by Manthra—her very nature is said to have altered. Manthra as evil incarnate and Kaikeyi's conversion together undercut any full sense of motivation on their part, their actions retain an edge of arbitrariness. The second remarkable fact is that once converted, Kaikeyi metaphorically beautifies, even sexualises, the hunchback Manthra's body almost in the language of love—even the hump is no longer a deformity but an object of love, a unique, integral part of her. The hump is where Manthra's intellect, inclination, recollection, jurisprudence, wisdom, sagacity, statecraft, knowledge of fraud and delusion ('mati', 'smriti', 'buddhi', 'rajniti' and knowledge of the 'maya') are stored, if Bharat is crowned Kaikeyi will ornament the hump with a gold necklace and anoint it with 'chandana'.¹⁷ Admiration or gratitude takes the form of a fulsome acknowledgement of Manthra's person which becomes implicitly equal to or even surpasses Kaikeyi's own. What is the significance of endowing Manthra with a beauty that is full complement to her intelligence? It may be a sign of the suppressed potentials for reversal of the hierarchical relationships between women coded as 'beauty' and 'ugliness'. In that case, Shatrughna's dragging of the bedecked, bejewelled Manthra across the floor breaking her ornaments.

Today,
we earn our stripes
in a different field.

Today, less than half our products are colour oriented.

We have diversified into a wide range of chemicals. Organic chemical intermediates and leather chemicals account for a major part of our total sales. Soon, we will begin making oilfield chemicals, saturated polyester resins and other chemicals. Our Marketing Division indents a large variety of chemicals and industrial

products from Hoechst AG and its affiliates worldwide.

Closer association with the reputed Hoechst AG of Germany now gives us full access to new product lines and latest technology besides assistance in the continuous upgradation of our quality, safety and environmental standards.

We are no longer just a 'colours' company.

Colour-Chem: now, more chemistry than colour.

until Kaikeyi intercedes with Bharat to save her, would be the symbolic inverse of the beautification. The now speechless Manthra sits at Kaikeyi's feet looking at her for protection with 'kaatar' eyes, i.e., at the brink of unspecified emotions.¹⁸ Third, though Manthra dictates the strategy, she resents having to do so: she even suggests a disingenuousness on Kaikeyi's part in suddenly choosing to forget a story—of the two boons granted her by Dashratha—she has often retold thereby 'setting up' Manthra as the schemer. In this virtual 'exposure' of Kaikeyi, Manthra appears to understand Kaikeyi's contradictory location in the patriarchal system. Manthra recognises the springs of Kaikeyi's resentment as well as her capacity to extract compensations from and enter into contractual, consensual settlements, while she herself personalised only by her 'abnormality' has neither a socially consolidated identity nor a set of consensually accepted capacities from which to 'work' the system and can only hope to sustain the pressure of individual incitement.

Finally, the wavering misogyny of the epic is a curious feature. Dashratha veers between blaming her personally and representing himself as a man trapped by the lure of a woman. He reminds himself that in condemning Kaikeyi he must not condemn all women as selfish. This may be an indication that misogyny is sufficiently consensualised to be considered as an explanatory mechanism. Bharat's abuse of his mother though the most vindictive,¹⁹ is personalised, all women appear good to him in contrast with Kaikeyi.²⁰ However, both he and Dashrath fear that the consequences of her action will bring total social perversion, break the bonds of conjugality, reverse orderly familial and social relations—a dystopian vision which may be a precursor of the conflation of 'kaliyug' and 'strisvabhav' later in some Puranic texts [Sangari 1990, p. 147]. Sumantra, who berates Kaikeyi, like the others, as a woman who has courted widowhood²¹ and destroyed the honour of the lineage, claims she has inherited her 'svabhav' (disposition) from her mother.²² Though a strict binarism between stridharma and strisvabhav is not in place, this does become one of the sites where misogyny is produced, a site marked by the tenuousness and fading of one language of women's customary 'rights' and the strong presence of an emerging notion of the good wife's duties as the desired basis of women's 'rights'.²³ Does misogyny originate in the crystallisation of specific hierarchical social forms? Produced in this instance through a set of ideological manoeuvres, in part to ratify

female self-abnegation, what does it say about the existing social agency of women? How does the move from the individual errant woman to the universalisation of misogyny and its subsequent placement in schemes of good and evil, occur? Is Dashrath's split between patriarchal dharma and sexual desire an indication that misogyny was produced from the contradictions between patriarchy and other social structures?²⁴

If here we have a version of a female agential mode in the making, a mode which is involved in the production of misogyny, replete with unresolved contradictions, some of which are compounded by our historical distance, it may be pertinent to conclude the discussion with a contemporary instance which, though it invokes the sedimented histories and repertoire of this unit in its narrative and cinematic forms, is a different phenomenon and part of a very different problematic.

Sadhvi Rithambara, the Bharatiya Janata Party ideologue, is placed squarely within a militant, communal Hindu right-wing formation. She affiliates herself to and speaks from two inter-connected sites of institutionalised power: a 'community' of 'sadhu-mahants' (religious mendicants and heads of 'maths' or religious centres), and the Vishwa Hindu Parishad, Bajrang Dal, RSS and BJP. The explicit staging of herself as an inciting woman emanates from an organised public domain; female incitement here is a unit of political discourse but works through a complex set of refractions.

This right-wing formation shares with other patriarchal ideological ensembles the desire to simultaneously consensualise women's investment in patriarchy and introduce or confirm a number of conditionalities; but unlike some other ensembles, it seeks to do so by invoking women's agency in the cause of Hindu *rashtra* (nation). The heritage of communal positions, which emerged out of the matrix of the 19th century, is one of squaring 'traditional' or existing patriarchal forms with the emerging bourgeois patriarchal forms [Sangari 1991 pp 36-40, 56, 57], while its present arena is a social formation in which the issue of 'acceptable' bourgeois rights for women of the middle and even upper strata is far from having been settled. Rithambara, a part of the new negotiations underway, is engaged in both a reassertion and a reformulation of patriarchal values, most notably in their coercive aspects.

Rithambara reproduces a Hindu communal, patriarchal history hinging on

male sexual honour, 'izzat' (honour), the values of patriliney and patrimony. She describes the future of the country, which Hindu militancy must prevent, as a repetition of the rape and pillage which is said to have characterised medieval India. She thus implicitly legitimises the masculinist ideology of rape as a 'normal', even an accepted rule in the complicit patriarchal codes of victor and vanquished, invoking a broad male consensus on retribution by violence on 'other' women as just, through the consenting voice of a woman. The march of this patriarchal history is punctuated with corroborative masculinist ideologies of male emasculation and impotence. In the process there is an obsessive re-enactment and reclaiming of male honour, which first plays on male fears of dispossession as well as on women's anxieties, by displaying all Hindu women as past and future victims of sexual violation, and then equates male sexual honour with the projected Hindu *rashtra* itself. 'Masculinity' acquires a single axis of social determination. The ability of Hindu men to protect their women, in a singular universalisation of the claim to martial valour, becomes the basis of their right to self government and their claim to monopolise a nation.

The nation, so defined as a condensation of the sexual honour of men of a single community, is intended to cut across and neutralise the contradictions of caste and class. Her incitement involves the social production of guilt and anxiety; in the address to men—'bhaiyon aur Hinduon' (brothers and Hindus)—the play on sexual honour carries the implicit threat of emasculation in the name of the violated mother (land), acquiring an additional frisson from her persona of the 'sadhvi' (literally a chaste woman). Within the stage-managed presence of the sadhvi, Rithambara uses sexual innuendo and jokes, exhorts in breathless 'chaupais' (verses with four-line rhyme pattern), projects a latent sexuality; the performance encourages a specific sort of male bonding as well as titillates middle class women in the audience. These devices work together to legitimise not only patriarchal but also communal forms of violence, which both in her own rhetoric and in her invocations is presented as a continuous, reiterated narrative of zealous women and flagging men.

At one level Hindu identity remains patrilineal—*ragon mein Hindu baap ka khoon daur raha hai* (the blood of Hindu fathers is flowing in their veins)—while Hindu strength (*shakti*) is presented as a divided patrimony, which can be reclaimed only if they unite.²⁵ At another level, history is presented as family history—a system of correctly claimed family

lineages. Muslims who claim Babur or Aurangzeb as an ancestor are at once treacherous enemies and cowardly eunuchs ('napunsak')—while those who claim Rahim and Raskhan can be addressed as uncles (tau and chacha). Muslims are asked to recognise that four or five generations ago, their ancestors were the same as Hindus. Family history is also the history of good and evil—Hindus have not worshipped their villainous relatives like Kansa, and if a Ravana or Kansa are born, then a god arrives as an avatar (incarnation) to destroy him. Ram is claimed as a father and his birthplace defended on the basis of custom, ancestry and emotional affiliation. The separation of wheat from chaff within the family draws on a masculinist ideology of the family feud,²⁶ while implying that Muslims lack family feeling and have an inadequate schema of good and evil. At a historical and political level, an ancestral lineage is presented as a product of choice not of birth—Hindu defeat is a product not of Islam but of the power hunger of medieval kings and contemporary politicians, while Hindus are divided between the Ramvanshis and the Ravanavanshis—thus enabling a selective appropriation of the history of nationalist reforms. At a social level, the family appears as the unit of social cohesion and her speech builds a fear of Hindu family relations breaking down with a concept of rights and greed for inheritance replacing duty towards parents on the part of children. The family then, as a set of associations, appears in a contradictory light—it is essential to communal identity, patriarchal practice and an honest polity, while itself remaining above the law and outside history.

Who is Rithambara herself? In the effort to carve a constituency, she must name herself as an individual in relation to a collectivity and its interests. Incitement in its inspirational forms found a fertile soil in certain nationalist tendencies where endangered masculinity, endangered women, endangered nation and religion were key themes while nationalist interpellations of Hindu women as uncorrupted were common. Further, even though several nationalist ideologies relied on and recycled convoluted notions of women's agency, they also succeeded in conferring a direct political agency on good women who could act on behalf of the nation. This repertoire of nationalism becomes the opportunist preamble to her self-location.

She names herself not as a woman but as a sadhvi, one of a community of sant-mahatmas or saints and holy men (shades of Bankim's novel *Ananda Math*?) Sadhus are presented as epic figures, a

complete Viswamitra who came to rescue India from Ravana. The content of this claim is not very different from other BJP MPs who are also offering self-images as saints engaged, now, as in ancient times, in purging or cleansing a criminalised body-politic.²⁷ Rithambara seeks to present sadhus as the uncorrupt new 'Mr Cleans' of Indian politics who however must now stand for unmitigated violence against the minority communities. The language of these hitherto peaceful men has become *ugra* (militant), but it is only the corruption of the polity which has brought them to the streets. Not only do they constitute a supreme court of saints ('*santan ka nyayalay*') which has decreed that the claim to Ram Janmabhumi is valid, making all other proof redundant, but they will provide the weapons for the crowds who are exhorted to fight like Indra and Chandragupta.

One subset of the social relations which inform these self-descriptions becomes visible. The agency of sadhus is offered as both direct and surrogate (not unlike that offered to women); their real interests are said to lie elsewhere in the assured attainment of spiritual monarchy. Rithambara challenges misguided Hindus who think they are playing a political game or looking for political power, all they want is Ram and his supposed birthplace:

Are hame vote chahiye? Ham sadhu mahatma Vyas gaddi pe baith ke puri kaynat ke badshah ho jate hai. Hame tumhaari Delhi ki satta nahin chahiye. Hame hamara Ram chahiye. Hame Ram Janam Bhumii chahiye. (Do you think we want votes? We saints can become emperors of the universe simply by virtue of our claim to the omniscience of Vyas. We do not want political power in Delhi. We want our Ram. We want Ram Janam Bhumii).

Through the very energy of her disavowal sadhus emerge as they are: heads of decayed priestly groups, locked in internecine battles, seeking new sources of political, electoral and institutional power, and being sought as subsidiary allies by those emergent classes and class fractions investing in the ideology of Hindutva.

The persona of the sadhvi is clothed in self-abnegation, that abstraction which is the property of the body of sadhus to whom she belongs. This identification along with that of the past militancy of women—Durgavati, Rani of Jhansi—authorises, empowers and becomes the rationale for present incitement. By apparently giving up her entitlement to the material, Rithambara not only acquires an exemplary, exceptional personal upward mobility but is able to shift the level of political discourse from the challenge of material re-allocations to an ideological

plane. As a woman 'saint', she can assimilate the legacy of reform into communal reformism, vindicating the vicious call to communal violence on the ground of removing the inner taint of Hindus. Secondly, by joining the band of the 'desireless', she not only gains the authority to play with the discourse of desire and male impotency/sexuality (rather than confine herself to the conventional advocacy of celibacy of *brahmacharya*) but produces a volatile intersection between male sexuality and militant political agency—sexualising both the Hindu *rashtra* and communal violence, achieving an effect quite different from the male use of similar discourse.

The simultaneous interpellation of men as Hindus who desire Hindu *rashtra* and bear the burden of a corrupt polity, as protectors of women and 'true' nationalists, as the goaded and insulted victims of history, as men whose past tolerance having been read as cowardice must now prove their masculinity through warlike violence, offers them the prospect of reversal. The 'awakened Hindu' slides metonymically into a pantheon of armed gods—Bajrang with his 'gada' (mace), Ram with his 'dhanush' (bow) and Shiv with his 'tandav' (destructive dance). The devaluation of morals and ethics, public corruption and blackmarketing, the breakdown of familial relationships, as well as male degeneration into laziness and effeminacy or the loss of 'purusharth' (valour, energy) can all be spectacularly reversed through a three-point programme of reform: voting BJP, reclaiming Ram Janmabhumi, and killing Muslims.

Violence is explicitly linked to communal rioting—a major site for the crystallisation of communal identities—and familiar riot-centred ideologies of Hindu retaliation are replayed.²⁸ One of her specific targets for instigation is the PAC—of whose notorious communal role in riot violence we need no reminder. They are asked to desert Mulayam Singh Yadav in the impending showdown on October 30, 1990 as well as to fire at dissenters and Muslims.²⁹ The PAC are said to have Hindu hearts beating beneath their secular uniform ('*PAC ne vardiyan pehni hai lekin dil Hinduon ka dharak raha hai*'). Rithambara's personal identification with violence, as the only decisive political solution, is remarkably bloodthirsty. Drawing on the Durga and Kali genres of female militancy, she repeatedly argues for bloodshed ('*khoon-kharaba*') on a large scale if not for outright genocide:

Tum baat karte rahte ho ki ham balidan denge. Are ham balidan dena se pehle ham hazaar balidan lenge. Ab yeh khoon bahayenge hi nahi, auron ka bhi khoon bahayenge. (You keep saying that you will

sacrifice yourselves. But before we sacrifice ourselves we will compel 'others' to sacrifice themselves. We will not only shed our own blood but we will also make the blood of 'others' flow.)

As an inciting woman she seeks to produce a series of clones. Stories of mothers or wives inciting sons and husbands to militancy are ritually invoked: Bhagat Singh's mother, who wept when her son was hanged not because he was dying but because she had no more sons to offer to the nation, rubs shoulders with the wife of a 'seth' (merchant) who repeatedly tells her husband that thieves are entering the house, emptying the money box, and leaving with the loot. The merchant's wife tries with these taunts to prod and activate her husband's virile masculinity—'*Is tareh patni ne pati ke purushtva ko phir kureda*'—and failing, bursts out with an irate demand for action from him. Women in families need to protect male izzat and nurture male valour. Ironically, the ideology of izzat is open to cross class universalisation precisely because it mimics the actual practices of patriarchal violence against women which cut across caste, class and communal distinctions. Here izzat is presented as a structuring principle both in daily life and in times of crisis. Izzat is in fact placed at the intersection between patriarchy and communalisation—two axes of inequality—and underpins other claims to family, religion and nation. Women are offered agential roles only as the implicit subjects of a communal history of sexual violation and their consent is sought in the interests of their own protection.

The literal effects of Rithambara's incitement should not be underestimated. Her speeches are reported to produce delirium and male hysteria among listening crowds¹⁰ and there are instances of men taking up the proffered role: after one of her speeches some BJP supporters reportedly beat up Muslims in an adjacent 'mohalla' (neighbourhood) before going home [*The Times of India*, June 14, 1991].

The agency of such literalisation is not a spontaneous but an institutional one, one which also gives Rithambara the 'protection' to instigate. Her speeches constitute a small part of the general instigatory activity and propaganda produced by these institutions. The communal violence that her speeches leave in their wake or return to legitimise, is not propelled by ideological mobilisation alone—but erupts rather, in its specific conjunctural combinations with the operations of a growing institutional infrastructure, forms of political mobilisation, local histories and the wider contradictions of social processes, creating spaces vulnerable to communal differen-

tiation and violence. That is why her speeches 'work' at some times and in some places but not in others. Rithambara herself seems to have been assigned a conjunctural role and is moved from backstage to centrestage at strategic moments. The men who engage in communal violence do not do so literally at her behest, but on the understanding which she represents of violence as having institutional sanction, organisational protection, a degree of popular consent, and consequently an immunity from subsequent legal action. Participation in violence in turn builds both complicity and danger, reinforcing the need for party or other organisational protection.

Before looking at some of the specificities of her institutional agency and her function as an inciting woman, I will try to look at her in relation to the broad ideology, flexibility, selective appropriation and current location of this cluster of right-wing organisations, especially the BJP. The BJP not only has different caste-class, urban-rural constituencies in different regions but shifts are taking place in its social base.¹¹ The right-wing needs to renegotiate its basis of legitimisation both internally with its cadres and externally in relation to desired constituencies. As such there is now a whole spectrum of right-wing ideologies and practices while a range of multifaceted positions, local as well as general, are being produced. Their eclecticism as well as appropriative procedures have to be seen both as a part of the wider imperatives of this spectrum as well as in relation to their present political location.

At the ideological level, the eclecticism within this formation is partly a product of using different existing modes of legitimisation—mythic, empirical, historical, customary, religious, experiential.¹² Indeed, it is this multifacetedness which has multiplied the axes of communalisation to extend beyond religion while creating flexible mechanisms for the inclusion or exclusion of some minority communities as the changing situations demand. However, though in some senses the accommodative capacities of this right-wing formation make for an internal pluralism, they also unify it and make it monolithic in relation to what it is opposed to. Given the unsettled nature of class, caste and gender issues, communalisation has become a major axis of internal unification and public consensuality, a vector for the interested reinterpretation of social contradictions.

There has also been a selective appropriation of the left, liberal, civil liberties and feminist platforms, which are then deflected, controlled, condemned. In this process blocks of existing social con-

sensus are being shifted rightward. Present consciousness are appropriated, re-coordinated, achieving new consensual patterns. Liberal positions in particular have been either massively taken over or evacuated.¹³ Rithambara achieves the shift from the liberal to the militant right by presenting political choice as a temporal-historical movement ('we were once liberal but now...'), making a sliding continuum from liberal to right along which it becomes *natural* to move. Even the image of secular co-existence (mandir, masjid, gurudwara) is used first to promote a liberal self-description and then, in this historical schema, turns into a rationale for communal violence.

A parallel process is at work with feminism. Certain aspects of bourgeois feminism, women's advances and own efforts to redefine their social agency and sexuality are acknowledged but only in order to curb them or roll them back or to monitor women's entry into the 'public' sphere, or more broadly to control the ways in which public becomes private and vice versa. However, contradictions between domestic ideologies, patriarchal practices and independent public, political roles for women is rampant within this formation. The package on offer ranges from the blatant anti-feminism of Bal Thackeray interested in pushing women back into the home, to K R Malkani's claim that though inequalities exist, Indian women are by and large queens in their homes [*Times of India*, May 15, 1991], to Rithambara's explicit appeals to certain kinds of initiative on the part of women. Significantly women's support to Thackeray is dwindling, while though Rithambara's claim to inspirational agency appeals to both men and women, she has been criticised by some BJP men and women. Neither Thackeray nor Rithambara singly represent the fully consolidated or consensual voice of the Hindu communal right.¹⁴ At other sites the BJP has been taking certain aspects of bourgeois feminism on board; for instance their *stri shakti* versus *stri mukti* (women's strength versus women's liberation) programme in Gujarat, and Maharashtra continues aspects of middle class reformism and presumes the existence of working women while attempting to denigrate other aspects of feminism as deviant.¹⁵ Rithambara's position needs to be seen in relation to this conflict of interpellations, as a singular variation among a whole range of ideological positions being produced within this right-wing formation.¹⁶

The eclectic and appropriative strategies of this cluster of right wing organisations allows them to insert themselves into different regional and political conjunctures,

gives them the ability to absorb and replay conjunctural gains, situational exigencies, contingent attitudes, to use religious faith as well as to bypass it, in order to bind unconsolidated urban masses into collectivities and to achieve new, smooth relations between verbal rhetorics and conflicting social practices.

The concatenation of voices in this right-wing formation, in some sense corresponds with its current political location. The development of multiply organised addresses alongside broad general ideologies as well as of different, locally accented ideological positions and institutions drawing on different class/caste and experiential clusters is related not only to the range and to changes in class/caste constituencies in different regions but also to the overall strategy of simultaneous insertion into existing rural/urban power structures while making new avenues for political mobility. The quadrangular political formation of the Hindu communal right—the BJP—as a parliamentary opponent of the central government, as itself a contender for central-state power in search of appropriate legitimacy, alongside the steady, systemic infiltration of the institutions of state and civil society, and the development of fascistically organised militant wings in the RSS, BD and now the Durga Vahini with their ready recourse to communal violence in specific electoral or other conjunctures—is making for an oscillation between parliamentary forms and fascist methods. This, combined with its overall location, makes it possible to understand both the internal heterogeneity of ideological positions as well as the specific modalities of holding ideologies as a persistent pressure, as a sign of political power, as a reminder of the organisational capacity for violence, and as trigger for violence in specific conjunctures.

If we look at Rithambara as one such pressure point, then apart from the overlap between the content of her speeches and organisational positions, at least two of the special functions which female incitement serves can be demarcated. Here, it is once again significant that Rithambara does not name herself as a woman. Her function is not to represent other women in relation to the problems of inequality but to reiterate and represent women only in terms of a specific set of patriarchal consensualities which are particularly conducive to conjunctures of communal violence. (From these she also extracts a singular discursive and political power for herself.) It is not that she blocks off all change for women on the Hindu communal right but rather offers them the combination of direct and convoluted

agency which is also vested in her own person: a particular sort of militancy drawing on nationalist models which infuses her with a quasi-patriarchal authority combined with two facets of bourgeois domestic ideologies, self abnegation and women's surveillance of the public sphere [Sangari 1991, pp 106, 07, 113]. This offer of male protection is accompanied by the usual codicil that protection from the threat of male violence be accompanied by submission to patriarchal norms in the home. In other words women are yet again asked to become the consenting custodians of patriarchal values in order to be eligible for certain forms of protection and agency, but this time with the implicit guarantee of becoming participant as instigators in Hindu male communal coercion and as sharers of the power which may accrue from it. Female incitement becomes a compensatory structure for women to police men while it is at the same time poised and held at the brink of militancy in its own right. However, the question of the precise nature of the needs and interests of different sections of women which the Hindu communal right is producing and encashing is much bigger and as yet unanswered. How, for instance, is Rithambara's offer of male protection articulating with different existing or desired class positions within the constituency of Hindutva?

Secondly, Rithambara performs the function of drawing wide consensualities of values, including that of male coercion, through which patriarchies function, into a new relation with organised Hindu militancy. She elicits consent for patriarchal values on the basis of defence of 'nation' and 'religion' and simultaneously uses existing social consent for patriarchies to get consent for Hindu rashtra.¹⁷ In her own combination of institutional power with normative patriarchal ideologies, recast as a challenge to male sexuality, she ratifies both. She thus draws on and increases areas of consent, enlarges fronts of recruitment. The issue here is one of the very modality of the production of new ideological constellations. Here, too, some broad questions remain. What is the nature of the articulations, transformations as well as displacements between the political, the economic and this ideological constellation? Which are the mechanisms by which performative political rhetorics reappropriate media and cinematic forms, relating them to 'common sense' and encashing the resonance of both? What are the precise relations of the cultural forms of articulation with their respective histories and of the specific ideologies generated by this Hindu communal right-wing formation to its existing and desired social base?

Notes

[A longer version of this essay is forthcoming in *Region, Religion, Caste, Gender and Culture in Contemporary India*, T V Sanyamurthy (ed)

- 1 Even where women's agency is enhanced from belonging to semi-autonomous form of female collectivity, as for example in matrilineal groups, we would still need to ask how these groups connect not only with other structures of dominance (e.g. caste, religion, law) but also with other operative adjacent patriarchies.
- 2 For a related emphasis see Perotti, Daugherty et al (1990).
- 3 This formulation begs two questions which also need attention—the determination of men by patriarchal structures and men's consent.
- 4 The fact that patriarchal violence practised against women often also functions on behalf of social consensualities dispersed in 'common sense' or condensed in symbolic systems, shows how deeply embedded and widely dispersed it is across the social formation.
- 5 Our own embarrassment about explaining women who oppressed other women in instances of family violence such as dowry murders was in fact one of the starting points for reflecting on the whole issue of consent. For a discussion of a recent display of the collective solidarity of upper caste women against lower caste men and women see Kannabiran (1991, p 2132). For an account by dalit women of their oppression by jat women in a Punjab village, see interview [Manushi, 1979-80, p 21].
- 6 Women's agency is often pejoratively slotted as manipulative. For a discussion of the use of manipulative strategies in the absence of formal power, see Schrijvers (1986, p 15). According to Leela Dube, in her experience women are not accused so much of manipulation in matrilineal groups whereas manipulation is built into the structure of patriliney. In what is a virtually archetypal contemporary representation in this genre, Prabhat Studio film on the Peshwa Shastriji, made in 1945 presents Lalit Pawar in the role of the bad wife who incites her husband and her advice leads to the loss of his kingdom. She is bad because she is an explicit surrogate power sharer in her husband's position and an active class agent. The film recognises and displays the power which exists in structures of surrogacy only to condemn it. Such a woman contradicts bourgeois domestic ideology which describes women as non-competitive and as the good conscience of the man—her incitement pollutes the domestic space. The tendencies in elite nationalism which constitute the wife-woman as the conscience of both man and nation, inversely enlarge the criminality of such 'scheming' women—making them the first anti-nationals as it were. Their crime is overtly, explicitly wanting to share power and giving no other name to female agency as it has been socially constituted. Since various tendencies in elite nationalism were engaged in building a consensual patriarchy, the familial

s of nationalist and proto-nationalist reform tended to make the public activity of women a natural extension of domestic activities—only bad women spoke in their own name.

- 7 For a suggestive reading of this episode, see Sutherland (1983).
- 8 How precarious this ideality (as well as how unsettled primogeniture as a norm) is can be judged from the facts that Lakshman's response to Ram's exile is to take over the kingdom by force, imprison or kill Dashrath, and destroy all dissenters; while later Ram in the forest fears that Kaikeyi may poison Kaushalya and Sumitra.
- 9 Even Brahma and Indra granted boons for impeccable devotions to demons which made them helpless later, and there are many stories of the gods in their own protection using codicils or calling on some counteracting power. The boons granted by gods are often a means of negotiating, propitiating, containing or being forced to acknowledge a source of self-accumulated, threatening power. It is interesting to note that Dashrath and Vasishtha also do their best to circumvent the boons. Dashrath orders that the treasure of the city, attendants and the army be sent with Ram to the forest since the boon did not specify that he go empty-handed. Vasishtha says that either Sita can rule the kingdom in Ram's absence, or the wealth and population of the kingdom should follow Ram. Kaikeyi has to struggle to maintain her demands.
- 10 This too remains problematic. Why is a context needed at all? Would she have had less leverage if Dashrath who is about to renounce political power were also able to renounce the sexual desire which is repeatedly described as enslavement?
- 11 Exactly what Ram has told Kaushalya. That is why Kaushalya becomes Bharat's 'true' mother.
- 12 Sita's threatened suicide if she is not allowed to join Ram's exile because she does not want to be left unprotected in the palace. Sita's lament at being abandoned by Ram despite her devotion when she is imprisoned by Ravana, Kaushalya bemoaning her status which has been equal to that of Kaikeyi's servants, Kaushalya's sense of vulnerability and fear of the taunts of junior wives once Ram is exiled, and her claim that having had no happiness with her husband she had looked forward to *putrajya* for an end to her troubles—all testify to this.
- 13 Ram even claims he won Sita back to restore his own fame and not for love of her, and describes her abduction as Sita's sexual dalliance with Ravana.
- 14 If they are obscured or resolved at all it is in the latter-day, now hegemonic versions of the epic.
- 15 In Dashrath's literal distribution of sons in the form of fertilising 'kheer', the largest portion goes to Kaushalya and the smallest to Kaikeyi.
- 16 Significantly, Ram himself is inclined towards interpreting Kaikeyi's action as preordained. He soothes Lakshman saying that the very suddenness and extremity of Kaikeyi's behaviour shows it is a part of god's design, otherwise how could a good woman give her husband such pain.
- 17 And provide her with a retinue of dwarf and hunchback women servants!

- 18 These, as associated with the word *kaatar*, almost a pre-emotion, could range from fear, impatience, excitement, nervousness to cowardice.
- 19 He not only invokes every possible sin, dishonour and punishment in the book for her but tells her to walk into a burning fire or hang herself, and says he would kill her himself but for Ram's disapproval of matricide—magnifying her 'sin' beyond endurance and moving Kaikeyi to tears.
- 20 In one sense personalisation contains the action of Manthra and Kaikeyi.
- 21 There are repeated images, which haunt Dashrath and even Ram of Kaikeyi enjoying power as a widow, i.e. such a widow's suffering is not a certainty, ideologically that is. Kaikeyi becomes a husband killer in an epic which sets out to deify husbands and universalise *naridharma* through Kaushalya, Anasuya, Sita and the choric voices of the faceless women of Ayodhya.
- 22 Kaikeyi's mother accused of lacking all competence—*naridharma*, respect for family honour, a carelessness regarding her husband's life—is dismissed from any justifiable claim to queenship. However, the real issue, over which she is banished from her husband's home, is her challenge to male control of knowledge.
- 23 Kaushalya eventually translates her husband's rejection into duty and so succeeds in remaining good. Despite latent fraternal and polygamous politics, the onus of disharmony is put on Manthra and Kaikeyi.
- 24 We are still left with a set of questions related to the mythic refraction of social practices and norms. Which are the earlier or extant systems of mutual or reciprocal rights for women which are now being eroded or sought to be supplanted? What was the relation between primogeniture, polygamy and female sexuality as glimpsed in Kaikeyi's transition from wife to mother? Is Kaikeyi's agency on her own behalf, or on her son's or on both? What was the wider set of relations between kinship and politics which produced inequality in the palace? What was the ranking and location of brideprice in terms of extant marriage arrangements? Were brideprice agreements honoured? Was polygamy one of the breeding grounds for both the ascription of scheming women and of a corollary convolution of women's agency? What was the relation between Dashrath's visibly overpowering love for Kaikeyi and his failure to obey the terms of the brideprice agreement? Could hierarchy be altered in the name of love or did polygamy function to split male duty and male desire? Was there an inherent contradiction between *naridharma* and polygamy? Would the nature of Kaikeyi's agency and social valuation change if the brideprice agreement entered the chain of causality or would it still go against the social grain? What other kinds of female agency is Kaikeyi's counterposed to in the *Valmiki Ramayana* and how are Manthra and Kaikeyi presented in other recensions of the *Ramayana*?
- 25 She claims that now Hindus are like the 'pehalwan' (body builder), who had maintained his strength through daily 'dand baithak' (exercise), but failing to maintain it after marriage, turned into a weakling. His 'samajhdar' (sensible) wife, who he

blames for his weakness, demonstrates that he can perform the same feats if accompanied by his five strong young sons. This discussion is based on two audio-cassettes circulated during the peak of the Ram Janmabhumi campaign.

- 26 Hindus are asked to give up evil fathers as Prahlad gave up Hiranyakashyap, or renounce evil brothers as Vibhishan did Ravana.
- 27 According to Swami Sakshiji Maharaj, a BJP MP from Mathura: "In ancient times kings ruled but holy men held the reins" [*The Times of India*, June 28, 1991]. See also the statements of Swami Chinmayanand, BJP MP from Badaun (UP) in *The Times of India*, July 23, 1991. In a virtual replay of Annie Besant, Rithambhara claims that in Indian history every successful king has had the blessings and advice of a guru or saint. Besant, with her notoriously organicist view of India had stated in her lectures that in the past rishis (ascetic saints) had actively participated in politics, wandering around the country, visiting kings and asking whether they looked after the widows and orphans of those who had died on the battlefield.
- 28 Rithambhara too claims that Muslims start all riots, have always attacked Hindu processions at Dussehra and Diwali while Hindus, too tolerant in the past have not attacked Muharram processions. Hindus are killed and now must retaliate. Masjids, said to be arsenals, are more or less specified as a target. For evidence and analysis of the role and deployment of these ideologies during communal riots see PUDR (1990) and Chakravarti et al (1992). For a discussion of instigatory pamphlets intended to create a paranoid, guilt-free, militant Hindu, see PUDR (1990, pp 8, 9). The call to destroy masjids must be seen in the context of the large number of masjids attacked and damaged in northern India in the course of communal riots during this period.
- 29 According to her, they all remember the day when they did not have a 'naukari' (job) and prayed to Bajrang Bali for help, promising 'prasad' (food offering to idol) in return, and when they lose their jobs they will have to take Ram's 'sharan' (sanctuary). However the matter does not rest at setting up Bajrang Bali and Ram as an employment agency in order to establish the PAC as 'Rambhaktis' or true devotees of Ram. When Mulayam asks them to fire they will fire but time will tell whether the bullets will be aimed at Rambhaktis or 'Ramdrohis' (those who have been traitors to Ram). On that day, the PAC will turn into 'Bajrang Balis' and undertake a ten to one contest with 'Alis'.
- 30 A man was reported as crying from excitement [*The Times of India*, April 5, 1991].
- 31 The RJB campaign has consolidated a rural base in the past three years, as for instances among labouring classes and rural elite belonging to intermediary castes in parts of Bihar [PUDR 1990, pp 29-32]. Along with the BJP base among the petty bourgeois intelligentsia of Bihar and UP, it has also acquired a base among small town commercial and manufacturing groups, a strata of mofussil trader which cannot readily transform into corporate capital in western UP while its base in central UP is more

markedly upper caste [Chakravarti et al 1992]. In Maharashtra, the BJP cadre, initially lower middle class and brahmin, is now shifting to upper class, professional and entrepreneurs—the 'modernised Hindus' as it were—and there has been a conscious effort to enlist non-brahmins. Pandurang Shastri Athavale who is drawing in OBCs expounds a 'modern' Hinduism, holds relatively liberal positions on women's issues and is said to have affinities with this right-wing formation. Similarly, Pradeep Ravat of the Patit Pavan Sangathan, which works in tribal regions, identifies feudalism and religiosity with a reactionary Hindutva and claims to be a Hindu who has never followed a word of Hinduism. In Gujarat it is not the brahmin-bania but the patel-kshatriya, the nouveau riche, NRI's and westernised youth who support the BJP. Deepika Chikhalia, the Sita of the television *Ramayana*, recently elected BJP MP, is said to be unable to speak more than two words of Gujarati! In both regions the old fashioned RSS ideology is moving out and a new managerial group with a different understanding of religion is moving in. (I owe this as well as all subsequent information on Maharashtra and Gujarat to Ram Bapat, Vidyut Bhagwat, Vibhuti Patel and Sandeep Pendse.)

- 12 They draw selectively on existing experiences, frustrations, grievances, inhabited prejudices, presenting them as the only reality in explanatory discourses which make people feel that their 'real' experience is being recognised.
- 13 As is well known these organisations place liberal secularism outside the consensus of the community of 'ordinary people' via appeals to common sense or brand them as communal through strategic reversals which also help to conceal their own agency.
- 14 In Maharashtra, it is not senior Rashtra Sevika but a young Rashtra Sevika and ABVP activist in Kolahapur, Medha Nanivadekar, who has publicly criticised Rithambara for using them for their own purposes. Some BJP men have also said that Rithambara's language is not suitable for women while right-wing women resented Bal Thackeray's derogation of women at a recent meeting in Maharashtra.
- 15 They claim to want neither divine shakti nor liberatory feminism. Sri mukti is identified with a caricatured female permissiveness, communism and the Nehruvian legacy while shri shakti is identified with the mobile mainstream and its platform consists of positions against dowry and violence and demands for palnaghara or creches, safety for women commuters and a uniform civil code.
- 16 For a discussion of the Rashtriya Sevika Samiti and the particular accommodation of women's militancy and professionalisation see Sarkar [1991, pp 2061, 62].
- 17 The parallel with Britain in the 1980s is interesting: since 'patriarchal positions are absolutely central, as points of condensed articulation, in the discourses of both middle class, petit bourgeois and working class respectability—an apparently non-political factor that has the effect of stabilising and securing to the Right a whole range of other discourses' [Hall 1988, p 50].

Principles and Practices of VALUE ADDED TAX:

LESSONS FOR DEVELOPING COUNTRIES

235 + XII pages* Rs 250; US \$ 30*

Cloth Bound* 1993

In the light of the experiences of more than 60 countries all over the world, this book by Prof. Mahesh C. Purohit of the National Institute of Public Finance and Policy, New Delhi 110 067 presents lessons to be derived for commodity tax structure of India as well as for the other developing countries. It provides an intensive study of the system of value added tax in various countries, especially in France—the pioneer of VAT. The coverage includes an in-depth analysis of the rates, bases, exemptions, taxation of services and harmonisation of tax rates among EEC countries. It also includes an extensive discussion of the administrative organisational and operational problems encountered in different countries with special reference to the *forfait* system of France in dealing with the small dealers.

The book has been greatly appreciated by Indian as well as foreign fiscal experts and is highly recommended for students, teachers, researchers, policy makers and tax administrators in developing countries in general and in India in particular.

Tackling the Growing Burden of Public Debt

I S Gulati

This paper deals principally with some questions concerning the growing burden of internal public debt in India. These questions that have lately been raised with a stridency not noticed before focus on reducing the fiscal deficit, a term that hardly ever figured in the lexicon of fiscal policy in India, but which has all the same to be taken note of.

I

THERE is no gainsaying that public debt in India has grown rather rapidly in recent years. During the 80s the combined debt of the central and state governments grew at the rate of 18 per cent per annum as against the GDP growth rate of 14 per cent (both in current prices), with the result that the ratio of public debt to GDP which was already quite high,¹ increased substantially, from 50 per cent in 1980-81 to 75 per cent in 1990-91.² Thus an additional 2.5 per cent of GDP was added on to our public debt every year during the 80s. During this period both internal and external public debt increased rather fast, but the increase in internal public debt was faster. Between 1980-81 and 1990-91, the increase in the internal public debt was almost six times (5.84) as against that in the external public debt of almost five times (4.92).³

True, the magnitude and growth of a country's public external debt could legitimately cause concern. But the source of concern, namely, the pressure debt servicing creates for the balance of payments with respect to a country's public external debt, and that relating to the magnitude and growth of the overall external debt of a country are mostly the same. According to the estimates of a recent RBI task force, the total external debt of the country grew from Rs 19.5 thousand crore in 1980-81 to Rs 123 thousand crore in 1990-91, i.e., by 6.31 times, while its public debt component, as already noted, increased by 5.84 times, i.e., at a somewhat slower pace.⁴ The non-public debt component of the country's external debt has, obviously, been rising even faster. In 1980-81 the public debt component was as high as 70 per cent in the total external debt, but, it would have come down to 55 per cent by the end of the year 1992-93.

Not that the growth in the country's public external debt is, for the reason of its slower growth than that of the overall external debt of the country, less of a matter of concern. Indeed, all external debt, its magnitude and growth, should be of utmost concern to us. But we have to take note that lately the focus of attention has turned on the growth of public internal debt⁵ and it is on that component of

public debt that this paper concentrates. In fact, our focus is even narrower, in that we shall concentrate on the central government's internal debt which currently accounts for something like 85 per cent of the combined internal debt of the central and state governments.

II

As a proportion of GDP, the central government's outstanding internal debt⁷ rose from 35.6 per cent in 1980-81 to 53.3 per cent in 1990-91. During the same period, gross interest payments on internal debt, as a proportion of GDP, more than doubled, as they rose from 1.7 per cent to 3.7 per cent. Other measures of growth in gross interest liabilities show an increase, more or less similarly dramatic. As can be seen from Table 1, as a proportion of the centre's total expenditure, these payments showed an escalation from 10.5 per cent to 18.7 per cent during the same period; as a proportion of the revenue account expenditure from 15.4 per cent to 26.1 per cent; as a proportion of revenue receipts from 18.1 per cent to 34.6 per cent and as a proportion of tax revenues from 24.6 per cent to 45.7 per cent. Of course, each of these measures has, at the same time, a story of its own to tell, given the denominator used for the purpose. A substantially higher proportion of the centre's expenditure was accounted for by interest payments on internal debt in 1990-91 than in 1980-81 is what the first two measures relating interest payments to total and revenue account expenditure tell us. When we relate interest payments to revenue account receipts and tax revenues, not only are the proportions accounted for substantially higher but the increase in these proportions over the period is also quite substantial. So there can be no two opinions that the gross interest obligations with respect to the centre's internal debt have become rather high during the course of the last decade. Going by the available figure for 1992-93, over half (51.9 per cent) the centre's tax revenues would have been earmarked for meeting its gross interest obligations.

But, is it right to assess the burden of public debt in terms of gross interest obligations without taking into account

the returns on investments financed out of funds raised by public borrowing? All funds borrowed by government need not be, and are not actually, deployed in investments, physical or financial. But the portion so deployed, particularly that made in financial investments, does yield returns, and that too directly in the form of interest receipts, dividends and profits. In 1980-81 as much as 84.3 per cent of the interest paid on the total public debt of the centre was recovered as interest receipts, dividends and profits.⁸ Compared to that, the amount recovered in 1990-91 worked out to 44.5 per cent. For 1992-93, the corresponding percentage works out to a slightly higher figure of 50 per cent, but is still considerably lower than the recovery ratio in 1980-81. Thus, while the centre's debt mounted and its gross interest obligations increased, correspondingly its recoveries declined, relatively speaking, with the result that the burden fell with even greater force on the general budget.

As can be seen from Table 2, the spurt in net interest outgo, i.e., after netting for receipts on account of interest, dividends and profits, has been quite phenomenal over the period, 1980-81 to 1990-91. Since direct receipts of the exchequer from public investments have registered most niggardly increases—when measured as a proportion of GDP, they increased from 1.6 per cent in 1980-81 to 1.8 per cent in 1990-91—the government has been constrained to meet a larger proportion of its net interest outgo from its general budget. Between 1980-81 and 1990-91, the net interest outgo, as a proportion of the centre's current account receipts, increased from 9.5 per cent to 23.4 per cent; as a proportion of the centre's tax revenues the corresponding increase was from 12.9 per cent to 30.9 per cent. As a proportion of the centre's total expenditure it registered an increase from 5.4 per cent to 12.8 per cent.⁹

III

Of course, it can be argued, and quite justifiably so, that to view the burden of public debt in terms of the declining recovery ratio, or the burden of net outgo on the general budget, as has been done

in the preceding paragraphs, would be to take too narrow a view. Deployment of funds raised by a government for purposes which are not directly remunerative, in the sense of yielding interest, dividends or profits, could still be quite productive to the economy as a whole, in the sense of improving its efficiency of production or adding to its productive capacity through improved economic or social infrastructure. In that case, could one not legitimately expect the public investments to reflect themselves in higher growth of national income and correspondingly in better revenue receipts of the government, especially tax receipts? Between 1980-81 and 1990-91 the central government's revenue receipts, as a proportion of GDP, increased from 9.4 per cent to 10.7 per cent and tax receipts from 6.9 per cent to 8.1 per cent. During the same period, annual growth registered in GDP was of the order of 5.5 per cent in real terms, whereas net borrowing (including borrowing from RBI) of the central government increased from 6.6 per cent to 8.6 per cent and gross interest obligations increased from 1.9 per cent to 4 per cent of GDP. Obviously, the increase in the central government's receipts as well as in its tax receipts has been far below the increase in its gross interest obligations even though the growth in GDP was by no standard insubstantial. So, while the productive impact of a large proportion of public expenditure cannot be ruled out, the fact cannot be overlooked that it has failed to reflect itself in sufficiently enhanced revenues of the central government.

The increasing ratio of net outgo on account of interest payments to the government's current revenues and tax revenues, both of which, as noted above, rose significantly during the 80s, tells us more than that the recovery ratio declined during the period. Of course, the single-most important factor responsible for the increase in the burden in the sense of the proportion of the government's receipts to be set apart for meeting the net outgo on account of interest payments has been the decline in the recovery ratio, i.e., the ratio of interest and related receipts of the government to its gross interest obligations. As was noted above, this ratio came down sharply from close to 85 per cent to well below 50 per cent in the course of the decade. At the same time, however, it was also the tardy expansion in government revenues in general and tax revenues in particular, that was responsible for the net outgo registering the sort of sharp increase observed above as a proportion of government revenues.¹⁰ The question of sustainability of public debt assumes

importance as the ratio of the outgo to government receipts mounts.

If direct returns from government investments do not expand as public debt mounts and if at the same time, government revenues do not expand sufficiently, the higher relative burden of the net outgo can mean either reduced non-interest government spending or larger fiscal deficits or, of course, a combination of both. In the process, a sort of vicious circle can get into motion with higher deficit leading to larger borrowing which causes still higher deficits because of the larger net outgo. The villain of the piece, it must however be recognised, is a mix of inadequate recovery ratio and insufficient revenue mobilisation.

IV

How do we tackle the situation created by the high ratio of the interest outgo to the government's current receipts? The question we have to ask, therefore, is whether in the light of the developments of the past decade with regard to the increasing burden of interest outgo, the accent of current fiscal policy is rightly focused. By targeting the fiscal deficit, defined as the excess of total government expenditure over government's current ac-

count receipts, the recent governments at the centre (there have been three governments in as many years) have sought to focus attention on containing public borrowing regardless of not only whether it takes the form of borrowing from households, or from banks or from the Reserve Bank of India¹¹ but also what the funds raised in public borrowing could have been used for by the government. In fact, going by the position taken in the latest *Economic Survey* it would appear that the government would like to go much farther than containing current net borrowing and effect a reduction in the outstanding government debt.¹² To achieve this, the net public borrowing would indeed have to become negative at some stage. Any positive net borrowing would imply an increase in the absolute level of outstanding public debt.

Strictly speaking when the proponents of the concept speak of the fiscal deficit, no distinction is drawn between covering the fiscal deficit through external public borrowing and through internal public borrowing. We shall, however, assume for our purpose that the fiscal deficit, whatever be its magnitude, is covered through internal public borrowing.

To emphasise reduction in public borrowing in order to reduce the fiscal deficit

TABLE 1: GROSS INTEREST PAYMENTS BY CENTRAL GOVERNMENT

Gross Interest as Percentage of	1980-81	1990-91	1991-92 (RE)	1992-93 (BE)
(1) GDP	1.7	3.7	4.0	4.2
(2) Total government expenditure	10.5	18.7	21.4	23.7
(3) Revenue expenditure	15.6	26.1	28.2	31.6
(4) Current revenues	18.1	34.6	35.1	37.2
(5) Tax revenues	24.6	45.7	48.8	51.9
<i>Memo items</i>				
(1) Centre's internal debt ('000 crore)	48.5	283.2	317.7	356.3
(2) Centre's interest payments (gross) on internal debt ('000 crore)	2.4	19.6	24.6	29.1

Source: *Economic Survey, 1992-93*.

TABLE 2: NET OUTGO ON ACCOUNT OF INTEREST PAYMENTS BY CENTRAL GOVERNMENT

Gross Interest Outgo as Percentage of	1980-81	1990-91	1991-92 (RE)	1992-93 (BE)
(1) GDP	0.9	2.5	2.8	3.0
(2) Total government expenditure	5.4	12.8	14.8	17.2
(3) Revenue expenditure	8.2	17.6	19.7	22.6
(4) Current revenues	9.5	23.4	24.6	26.5
(5) Tax revenues	12.9	30.9	34.1	37.0
<i>Memo items</i>				
(1) Interest receipts ('000 crore)	1.80	8.78	11.30	13.46
(2) Dividends and profits ('000 crore)	0.58	0.77	1.06	2.55
(3) Interest + dividends + profits/gross interest payments (per cent)	84.3	44.5	45.3	50.4

Note: No attempt has been made to disaggregate net interest payment attributable to internal public debt and those attributable to external public debt of the centre, in view of the type of assumptions found necessary to make for such an exercise.

Source: *Economic Survey, 1992-93*.

amounts to shifting the accent of fiscal policy from the mobilisation of current revenue receipts and the productive deployment of government expenditure to blanket reduction of government spending. One cannot rule out the possibility that a stage may arrive when blanket reduction in government spending may be called for. The question is whether that stage has arrived already. Has a proper assessment been made of the role of government spending of various types? For instance, has the limit been reached already for the role of government in the expansion and/or improvement of the country's socio-economic infrastructure? Here, one should add that distinguishing between revenue account and capital account in government spending may not be as helpful as between the purposes for which government spending, be it on revenue or capital account, is to be incurred. For that matter, even the distinction, between plan and non-plan spending is not very useful because a good part of non-plan spending is meant for the maintenance and running of the socio-economic infrastructure on which rests the whole edifice of the country's current economic growth.

Still, can the burden of public debt be said to become unsustainable just because the outgo on account of interest payments, gross or net, rises fast in proportion to total current receipts of a government and reaches levels which are considered high?¹¹ True, the higher the proportion of a government's current receipts to be earmarked for meeting the government's interest liabilities, the lower is the proportion thereof available for meeting the government's other expenditures, which the government is not contractually obliged to incur but which may still be very necessary to incur. Such other expenditures, at least a substantial part thereof, may be necessary to incur for the government to meet its obligations on the basis of its social compact with its people or to sustain the country's economic growth. Therefore, to seek to reduce the burden of public debt by reducing the government's other expenditures may well amount to reneging on its obligations under its social compact with its people or harming economic growth. Instead, the government should be exploring ways and means of mobilising additional current revenues. Larger tax revenues will reduce the government's deficit on revenue account as well as its fiscal deficit. Larger recoveries in the form of interest receipts, dividends and profits will reduce the net outgo on account of interest on public debt. True, in the end the government may have to borrow less, given the level of its total expenditures. But such restraint in public borrowing will have been achieved

by following a route that will force the government neither to renege on its social compact obligations nor to forswear the major role it has in sustaining economic growth in a country such as India at its present stage of development. These considerations cannot be overlooked when there is recognition all around that a substantial role is necessary for the government, given the present stage of the country's development, in the further building up of the socio-economic infrastructure required to sustain a high rate of economic growth.

It will be appropriate at this point to refer to the 1944 paper written by E D Domar.¹² This paper was, no doubt, written in the context of the post-world war II fiscal policy in the US, but it is in our judgment eminently relevant to the current discussion in our country on fiscal policy. In this paper, Domar demonstrates that "the problem of the debt burden is essentially a problem of achieving a growing national income increase". With a growing national income, Domar shows, the taxation required to finance the interest liabilities of a government on its public debt will not impose a particularly unbearable burden on the economy. In fact, he shows that "the greater is the rate of growth of income, the lower will be the tax rate [required to meet the interest charges on public debt], even though a more rapidly rising income results in a larger absolute magnitude of the debt".¹³

What is necessary to ensure, according to Domar, is that government expenditures are productive, not necessarily, however, in the narrow sense of requiring that "the assets constructed make a direct contribution to the federal treasury or are self-financing" but in the larger sense of contributing to the growth of national income. "National income", Domar asserts, "would be able to advance at a higher rate if governmental expenditures were productive in our sense".¹⁴ Thus, if we are worried about the burden of a growing public debt, the thing to do for policy-makers is not to stop or reduce public borrowing but to review the existing allocations of governmental expenditures and make sure that the maximum possible proportion of these expenditures is incurred in areas and in a manner that contributes, of course optimally, to the growth of national income. Then, with national income growing fast, indeed faster than before, if reallocations are done correctly, the burden of taxation required to finance the interest outgo from the budget will be possible to keep low and the sort of situation currently being faced by us, with an increasing proportion of the government's current receipts having to be earmarked for interest payments, will still be possible to avoid.

The answer to our current concern about the size and burden of internal public debt is certainly not to take fright and start slashing governmental expenditures so that net public borrowing can be curtailed, if not altogether eliminated, because in the process growth of national income could suffer. The recipe of slashing public borrowing would be tantamount to throwing out the baby with the bath water, if not killing the goose that lays the golden egg.

CONCLUSION

We could do no better than to conclude this essay with a ringing final observation of Domar from his paper referred to above:

When post-war fiscal policy is discussed, the public debt and its burden loom in the eyes of many economists and laymen as the greatest obstacle to all good things on earth. The remedy is always the reduction of the absolute size of the debt or at least the prevention of its further growth. If all the people and organisations who work and study, write articles and make speeches, worry and spend sleepless nights—all for fear of the debt—could forget about it for a while and spend even half their efforts trying to find ways of achieving a growing national income their contribution to the benefit and welfare of humanity and to the solution of the debt problem would be far greater.

Notes

[This is a revised, updated version of the author's D K Shukla Memorial Lecture (1992-93) at the Department of Economics of the MS University of Baroda. The author gratefully acknowledges the benefit he had of the comments from V N Kothari, J C Sandesara, S R Hashim, and R J Mody. The responsibility of errors, if any, is entirely the author's.]

- 1 India ranked among the top 15 countries in the world with regard to the ratio of public debt to GDP in the mid-80s. Interestingly, however, compared to Singapore's ratio of close to 90 per cent, India's worked out to 45 per cent.
- 2 The calculations are made after converting the outstanding external public debt at the exchange rate prevailing at the end of the financial year and adding them to outstanding internal liabilities. We agree fully with the observation in the *Economic Survey 1992-93* (p 22) that "it is more appropriate to convert them [i.e. external liabilities of the government] at current end-of-the-year exchange rates to reflect the burden of the debt fully".
- 3 Thanks to the sharp devaluation of the rupee since July 1991, the more recent figures have a different story to tell. The increase between 1980-81 and 1992-93 (RE) of the internal public debt works out to 9.35 times as against 8.31 times for the external public debt. (See also note 4.)
- 4 One has to be a little cautious here. What

is referred to here as public external debt appears to be too narrowly defined and is understood to exclude the external debt of even fully-owned government commercial undertakings, though almost all of that carries explicit public guarantees. Even the narrowly defined public external debt had, as noted, increased by 8.31 times by the end of September 1992 compared to its level in 1980-81 (see *Economic Survey, 1992-93*, pp 25 and 118), which compared to the increase in the overall external debt of 10.42 per cent over the same period was still lower. Here our assumption is that the figures put out for both public and overall external debt are broadly correct, at least in regard to change over the period. But note has to be taken of the existence of disparities between various estimates of the magnitude and growth of the country's overall external debt. Also, these disparities are partly at least traceable to differences in the estimation of public external debt (See, Arun Ghosh, 'India's External Debt in Relation to BOD Prospects', *EPW*, February 6.)

5 See, in particular, Raja J Chelliah, 'Growth of Indian Public Debt' in Bimal Jalan (ed), *Indian Economy: Problems and Prospects*, Viking, 1992.

6 In working out this figure of 85 per cent, we have excluded the debt owed by the state governments to the centre. This avoids double counting. It is well to bear in mind, however, that the states' debt to the centre is almost 2.5 times the debt they owe currently to others, including banks and financial institutions.

7 The term 'internal debt' is used to cover the various liabilities of the government which in official documents are referred to as 'internal liabilities' including what is narrowly called 'internal debt'.

8 While interest payments are shown in the official documents separately for internal and external debt, interest receipts, dividends and profits are not so shown. The practice so far followed in the official documents is to put out also figures of total net outgo on account of interest payments. But in netting for receipts, account is not taken of the government's receipts as dividends and profits and to that extent the net outgo on account of interest payments has tended to be overstated.

9 These figures are different from those given in the *Economic Survey, 1992-93* (p 26). The net outgo figures worked out by us include dividends and profits in addition to interest receipts. The increase in net outgo, as worked out by us, over the period is of the order of 2.4 times, substantial no doubt but far short of the four fold spurt referred to in the *Economic Survey*.

10 While direct returns from government investments figure in the numerator of the recovery ratio, the interest returns, assuming that they get reflected in the expansion of tax revenues and therefore of total revenue receipts, will figure in the denominator while working out the relative burden of the net outgo relative to the government revenue receipts. Expansion in tax revenues may come about either because national income itself grows fast or because given the rate of increase in national income

the ratio of tax revenues to national income rises. Of course, both the factors could well operate simultaneously.

11 The present writer has sought to bring out the implications of this particular shift in fiscal policy's focus requiring a blanket reduction in fiscal deficit. See, I S Gulati, 'Reducing the Fiscal Deficit', *EPW*, July 20, 1991. Also, R J Mody, 'On Defining the Fiscal Deficit', *EPW*, September 21, 1991 and Mihir Rakshit, 'The Macroeconomic Adjustment Programme: A Critique', *EPW*, August 24, 1991.

12 See, *Economic Survey, 1992-93*, p 28. In principle, a reduction in the centre's outstanding liabilities is possible through "either a primary surplus or from the proceeds of asset sales." But, as the *Survey* puts it, "the effectiveness of the latter" (i.e., debt reduction with the proceeds of asset sales) can be increased by retiring high interest debt or disinvestment of the equity of selected issues which were making losses." So we cannot be accused of stretching the point to infer that the *Survey* does envisage debt reduction in the absolute sense. Chelliah is much more forthright when he calls for the "liquidation of a substantial part of the existing stock of internal debt" without which, according to him, "it would not be possible to eliminate the revenue deficit within even the next five years" and "the demand of government investment will have to be kept too low, affecting growth and welfare" (op cit).

13 After noting that "interest payments net of interest received increased by nearly four times, from 3.6 per cent to 13.9 per cent" of total government expenditure between 1980-81 and 1991-92 (RE), the *Economic Survey 1992-93* speaks of the fiscal correction measures taken to reduce the level of borrowings and expresses the hope that within a few years the reduced level of borrowings will have "a perceptible impact on the heavy interest burden of the govern-

ment". While the *Survey* tries to pinpoint the factors underlying the phenomenal increase in the net outgo on account of interest payments particularly as a proportion of the revenue receipts of the government. Not surprisingly, therefore, the main focus of the so-called fiscal correction measures seems to be directed at reduction in borrowings.

14 See, E D Domar, 'The 'Burden of the Debt' and the National Income' in his *Essays in the Theory of Economic Growth*, Oxford University Press, 1957.

15 Following Domar, the required tax rate to meet the interest changes on public debt would approximate to

where a is the fraction of national income being borrowed by government, r is the rate of growth of national income and i is the real rate of interest.

Thus, assuming $a = 6$ per cent, $r = 5$ per cent and $i = 2$ per cent, the required tax rate would work out to 2.4 per cent. With only r changing to 8 per cent, the required tax rate will work out to 1.5 per cent.

Given Domar's definition of taxable income, his required tax rate is none other than the ratio of tax revenue to national income (including, of course, interest on public debt).

16 The view taken in the *Economic Survey 1992-93* (p 20) with regard to the efficiency of government expenditure is totally opposite to Domar's "In an efficient system" the *Survey* observes, interest payments of the government "would have been covered by returns on productive capital expenditure and investment financed by debt." Adjudged thus, the government's plan spending is found to be severely wanting and therefore comes in for severe strictures when the *Survey* notes that "instead of providing such a cover, plan expenditure has been characterised by low returns from investments and inefficiency."

Breast-Feeding and Working Mothers Laws and Policies on Maternity and Child Care

Mina Swaminathan

Laws and policies which attempt to promote breast-feeding merely by placing restrictions on artificial feeding without simultaneously providing positive social support measures may be damaging to children besides being unfair and unjust to women. A radical change in perspective is needed which recognises that a woman's reproductive role is a form of 'social production' which needs social support.

GREAT concern is currently being expressed about the trend towards decline in breast-feeding and its implications for the health and development of children. The efforts consequently being made to promote breast-feeding through social policy and new legislation, such as the Infant Milk Substitutes, Feeding Bottles and Infant Feeding Act (1992) tend to focus attention almost exclusively on the welfare of the child. However, keeping in mind women's dual roles as productive workers and citizens on the one hand and mothers on the other, it is necessary to raise certain issues related to working mothers and the law in order to take a more comprehensive and balanced view of the needs of both women and children. This becomes even more important since some of the existing and proposed laws seem to be contradicting instead of complementing each other in seeking to attain common goals. It is also inadequate to consider laws alone. A holistic perspective must take account not only of laws (and rules under them) but also of government policies as expressed in schemes as well as prevailing work-place norms and conventions.

This paper is hence divided into three sections: (1) The rationale for an approach to the issues related to working mothers, breast-feeding and the law; (2) Review of prevailing laws and policies and their implementation; and (3) Proposals for comprehensive legislation and policies.

I The Rationale

Considering the issues from the standpoint of the welfare, health and development of both women and children, and in the light of women's productive responsibilities as workers, the basic argument adopted here is that of all laws and policies affecting the working mother in relation to breast-feeding, those concerning maternity leave and benefits are of primary significance, those relating to creches for working mothers are secondary, while yet another set of other laws and policies can be considered as tertiary support systems. Before taking up the analysis of the prevailing laws and policies

from this perspective, we outline the underlying rationale for this argument.

Current medical opinion holds that exclusive breast-feeding is essential for the child for the first four months of life, with supplementary feeding ideally being started at four months. Continued breast-feeding is recommended during the period of weaning for several months thereafter. If the main concern is to find ways of allowing the mother to remain constantly available to the child during the first four months of life, it makes sense to begin by considering maternity leave and benefits as the primary instrument to assist working women.

There is some divergence of opinion about how long breast-feeding should continue, some specialists being in favour of continuing till the child is two years of age. There are also strong arguments supporting the hypothesis that prolonged breast-feeding reduces the chances of conception and hence contributes towards spacing of births. These controversies however do not affect the position as regards the first four months about which there is near unanimity.

Studies which provide the following kinds of evidence need serious consideration:

The volume of milk production in women during the first year does not vary much, but there is a definite variation with regard to the attainment of peak lactation. Amongst those women who may be termed 'early producers', the peak is attained at the end of the third month, while the 'late producers' reach the peak only after six months.

It has been found that working women in agricultural societies arrange for some kind of substitute feeding through caretakers in their absence during daytime and try to compensate by offering unrestricted suckling during the night [Helsing and King 1984]. This disrupted feeding pattern not only reduces lactation, which is responsive to demand and thus the total availability of breast milk to the child, but also increases the risk of diarrhoeal infection as a consequence of unhygienic substitute feeding, both factors contributing to malnutrition of the child [Population Reports 1984].

It has been found that amongst urban slum women in India many are unable to breast-feed the child exclusively for more than two months, their lactation failure being related to their own low levels of nutrition and health [Gopalan 1990].

These findings, which underline the need to provide the mother with adequate rest, nutrition and care during the first few months, also indicate the primary importance of maternity leave and benefits in this context.

Creches for children below six years form an essential support service for working mothers as well as a developmental service for children and hence require powerful advocacy. However, creches as support for breast-feeding are meaningful only under conditions which may be in practice difficult to meet, i.e., they must be: (a) close enough to the mother's work-place to be accessible for feeding throughout the day, and (b) competent to take care of infants during the first few months of life.

As far as the former is concerned, most women workers find it difficult to carry the child to the work place, especially if they have to travel long distances in urban areas. Besides, the environment at the work place may be unhealthy, hazardous or otherwise undesirable for infants. World-wide experience in the last 50 years has not found the work-place to be the best location for child care, being found satisfactory only in those cases where the work-place and the housing site coincide, as in the case of institutional campuses, large construction sites, and workers' housing colonies. Even the socialist countries which have pioneered the work-place creche are gradually moving towards creches in residential areas.

As far as the second condition is concerned, it must be noted that the youngest infants, for whom breast-feeding is relevant, are also the most vulnerable and risky to care for, and creches find it difficult to manage them except in very favourable circumstances. In general, the tendency is to concentrate on children older than one year of age, some countries even going so far as to lay down the minimum age for admission to the creche. Even in Vietnam, which has the most

extensive coverage of young children (0-3 years) in creches, it is comparatively rare to find infants below eight months of age in the creche. The creche seen merely as an aid to breast-feeding must therefore be considered only as a secondary support.

Tertiary support systems are needed, which have yet to evolve, including such elements as part-time work, take-home work, flexi-time, and shift work for mothers in the first year after childbirth, and extended parental or family leave later on.

II

The Review

Who are working mothers and how many? Census figures and estimates by various agencies [*Shram Shakti* 1988] indicate that there may be about 10 crores of working women in India, many of them below the poverty line. Estimates based on Census data [Swaminathan 1991] indicate that there may be at least two crores working mothers of young children (aged 0-6 years) whose 4.5 crores young children are in need of day-care. It is not possible to state how many of these children are infants (0-1 years) who need breast-feeding, but clearly the number would run into several millions, perhaps a crore, and concern several million working mothers. Most such working mothers of young children work out of economic necessity, which is made more imperative by the high incidents of female headed families among the poor.

To whom do the laws apply? In general, it is found that laws and statutory welfare provisions do not affect all categories of women uniformly but are applicable only to workers in the organised sector and in establishments of over a specified size. Self-employed, contract workers, those in small establishments may find themselves outside the scope of these laws.

It is estimated [*Shram Shakti* 1988] that 89 per cent of all working women are in the informal sector and only 11 per cent in the organised sector. It is difficult to draw the line between the two, though size of establishment and self-employment are two criteria which can be used to make distinctions. Thus, the majority of women in agriculture, construction, forestry, fisheries, dairying, and handicrafts may be self-employed, or work in small establishments, or as contract workers, and may be said to be in the unorganised or informal sector, women working in mines, factories, plantations, transport, utilities, etc., may be said to be in the organised sector. However, the agriculture sector includes large force of wage labour, more than 50 per cent of whom are women, while women working in shops, offices, schools, hospitals, welfare institu-

tions, etc., in the category 'services and professions' can be found in both groups.

Several laws and service rules, government policies and schemes, as well as norms and conventions affect the opportunity of working women to breast-feed their children. However, the only law which addresses the issue directly is the Maternity Benefits Act (1961).

(1) The act applies to women working in establishments employing 10 or more persons (including mines, factories, plantations, offices, shops, circuses) that is, it applies to practically all women in the organised sector.

(2) The act provides that a woman (who has actually worked for a period of not less than 160 days) shall be entitled to maternity benefit for absence from work not exceeding three months (six weeks immediately preceding and including the day of delivery and for the six weeks immediately following that day). This obviously restricts the period of exclusive breast-feeding of the infant to six weeks.

(3) A woman is also entitled to an additional period of leave with wages up to a maximum of one month, if she is suffering from illness arising out of pregnancy, delivery, premature birth or miscarriage. This clause is intended to safeguard the mother's health but cannot be used only to extend the period of breast-feeding.

(4) Section 11 Rule 6 provides for two nursing breaks of 15 minutes duration each in the course of the mother's working day. If the creche is not attached to the work place she can take not less than five or not more than 15 minutes time for travel. This assumes that the mother has access to a creche or some other facility near enough for her to avail of the nursing breaks.

It is evident that the present laws and conventions regarding maternity leave and benefits are not supportive to the breast-feeding mother, either quantitatively or qualitatively. To begin with, the law leaves out, for the basic purpose of maternity leave, the vast majority of women in the unorganised sector including home-based workers, self-employed, contract workers, etc., as well as let slip many who work in small establishments in the organised sector. And secondly, the provision regarding nursing breaks can become operative only for a minuscule number, as will be seen below.

Qualitatively, the law practically debars healthy mothers from exclusively breast-feeding their infants for more than six weeks and more or less compels them to resort to supplementary milk foods, thus running counter to the intention of the new bill for the regulation of infant foods and breast milk substitutes.

Creches are statutorily provided to women working in mines, factories and plantations (under the Mines Act, the Factories Act, and the Plantations Act) and also to contract labour and inter-state migrant labour (under the Contract Labour Act and the Inter State Migrant Workers Act). But even this statutory obligation only applies to establishments where more than a specified minimum number of women usually 30, are employed (except in the case of mines). There is no statutory provision for women in the services and professions, who hence have to depend on creches in the voluntary and private sectors.

Creches to support women in the unorganised sector are sought to be promoted by the Scheme of Assistance for Creches for Children of Working/Ailing Mothers, a central government scheme which offers financial assistance to voluntary agencies to run creches for children aged 0-6 years of working women below the poverty line.

In quantitative terms, the present laws and policies regarding creches leave out the majority of working women in the unorganised sector and their children.

In qualitative terms, it may be noted that the funding pattern of the scheme for creches makes it very difficult for NGOs, without additional resources to run creches as a satisfactory day-care service, judged in terms of meeting the needs of the mother or in terms of promoting the all-round development of the child [Swaminathan 1985].

As far as implementation is concerned, the available evidence (Appendix I) indicates that (a) the provision of creches is highly inadequate in relation to the total number of working women and their children aged 0-6, (b) very few creches keep infants (0-2 years) especially those young enough to need breast-feeding, and (c) only a very small number of creches are located at work-places.

The work-place creche as a support to breast-feeding is not at present an option for the great majority of working women in our country. Under prevailing conditions, it may be unrealistic to expect infants below 6-8 months to be kept in creches at the work-site and only a few mothers may be willing to utilise them.

It is interesting to compare our laws and policies with those of other countries. In the developing world most countries are in a position similar to ours, still bound by the shackles of the colonial past. The outstanding exceptions are the socialist countries. Most countries of the industrialised world have evolved more protective laws and policies for mothers and children, with the lead again being taken by the socialist countries (Appendix II).

III The Proposals

A radical change of perspective is needed which recognises that woman's reproductive role is a form of 'social production' that is, time spent on maternity is not to be seen merely as 'absence' from economically productive work, but as 'presence' in the socially and economically productive work of rearing the next generation, or in building human capital or human resource development. From this standpoint, a woman who is fulfilling the double roles of production and reproduction simultaneously (the working mother) needs social support from several sources, namely, the family, society (in the sense of community), the state and the employer. And it is only in relation to the last two categories, namely, state and employer, that the law can play a significant role.

Laws and policies which attempt to promote breast-feeding merely by restrictions on artificial feeding without simultaneously providing positive social support measures may be damaging to children besides being unfair and unjust to women. By limiting women's options and forcing women to make painful choices between child and work, such an approach places the burden of both choice and guilt on individual women, denying social responsibility for mother and child.

To genuinely promote the health and welfare of both mothers and children, there is need for comprehensive legislation and policies which will consider maternity and child-care services jointly, since pregnancy, childbirth, lactation, infant care and day-care form a continuum of needs. Such a perspective should concern itself with mothers and children for the entire period from pregnancy up to the time the child reaches the school-going age, with varying responses to each stage.

MATERNITY BENEFITS ACT

The single-most important step from the point of view of breast-feeding is the amendment of the Maternity Benefits Act along lines more sensitive to the needs of mother and child. The following suggestions attempt to tackle the problem directly.

(1) Maternity leave as such should be calculated from the day of childbirth and should be for a period of four months.

(2) Mothers may have the option of extending maternity leave for a further period, at first on half pay, and then no pay, but without loss of other service benefits, seniority, etc.

(3) Leave during the final stages of pregnancy from two to four weeks may be taken, as medically advised, and should be treated on par with medical leave. This

leave should not be deducted from maternity leave.

(4) Women should not be transferred or subjected to other punitive actions or suffer loss of benefits during the basic maternity leave period of four months.

(5) Nursing breaks should be of 40 minutes duration each—20 minutes for feeding and 20 minutes for travel and may be allowed till the child reaches the age of 12 months.

The rule should be applicable (a) when there is a creche facility, statutory or otherwise, at or near work-place, defined as ten minutes travel time each way; and (b) when there is any arrangement, individual or organised, by which the mother can go to the child or the child be brought to the mother within this time period. In the latter case, nursing space should also be provided.

It is understood that maternity leave of four months has already been introduced in the states of Haryana, Punjab and West Bengal.

In addition to legislation, supportive practices like part-time work, take-home work, and shift work in the first year after childbirth and extended parental or family leave later on should first be tried out as schemes or optionals, so that they can later be integrated into the system through law.

Creches and child care services are an essential facility for the children of working mothers both as support service for working women and as a strategy for the protection, care and healthy all-round development of young children. Even though creches may play only a limited role as far as breast-feeding alone is concerned, laws and policies for maternity and child care must be considered as a whole. It is therefore suggested that: (1) Contributions towards the provision of creche and child care facilities be made compulsory for all employers under the Shops and Establishments Act. This will bring many more women employed in services and professions under the purview of protective legislation.

(2) The existing rules be amended so that the statutory obligation to provide creche facilities may be fulfilled not only by each employer maintaining a creche but also by groups of employers coming together to jointly finance and maintain common creches and by creches financed by employers' contributions but managed by appropriate agencies, either governmental or non-governmental.

An example of such legislation is the recent amendment to the rules under the Factories Act in Tamil Nadu. While an example of support policy is the scheme being introduced by the ministry of labour, government of India providing training and financial incentives to groups of employers on industrial estates who are

willing to run common creches, either by themselves or by funding appropriate voluntary agencies.

From the experience so far, it is clear that such 'enabling' legislation can be translated into reality only with the help of further supportive laws, policies and schemes. Such support can be provided through setting up a National Child Care Fund as an autonomous or statutory body, exclusively for the purpose of funding, monitoring and supervising child care services for the children of women workers.

Suggestions for a National Child Care Fund drawing on contributions from employers, state, parents and donations (with tax relief) from the public, and devoted exclusively to the financing of creches and day-care for all children who need it have been made in *Shram Shakti* (1988). This document also includes detailed suggestions for setting up a national network of child care services.

It must be recognised that such protective welfare legislation and policies will first become available to women workers in the organised sector, who are not only a small minority of all women workers, but also already more privileged and more affluent than their sisters in the informal sector. In the present stage, this is inevitable. Studies have found serious and disturbing decline in breast-feeding among urban women in services and professions belong to the middle and lower-middle classes. Hence, though the urban service-sector working women may be numerically far fewer than women in the unorganised sector, they deserve serious attention from the point of view of promotion of breast-feeding.

But there are ways in which these benefits can be extended step by step to the unorganised sector. Two main approaches can be followed. (1) Extending statutory benefits to other categories of workers through occupation-specific legislation such as Bidi and Cigar Workers Act, and through proposed new legislation such as Construction Labour Bill, the Agricultural Workers Bill and the Karnataka Rural Development, Employment Generation and Employment Guarantee Bill. (2) Developing maternity and child care schemes as part of a social security network for women and children. Examples of both approaches already exist: The Employment Guarantee Act (Maharashtra) which provides maternity benefits to women working in projects covered by the act and the Maternity Benefit Scheme of Tamil Nadu and Maternal Protection Scheme of Gujarat which provide some financial help to women below the poverty line.

It must be recognised that such legislation is likely to meet with considerable

resistance from employers. Further, women workers themselves and women's organisations may be opposed to it, fearing adverse consequences on women's employment and discrimination against women. Trade unions, who have in the past been lukewarm to women's issues, may also be unlikely to offer support. Hence a widespread, active and sustained campaign of public education must precede and follow the enactment of any such laws in order to contain the possible damage to women's advancement and to promote and advance the cause of women and children.

Appendix I

Creches and Day-Care Services

According to government of India (Programme of Action NPE 1992, Ministry of Human Resources Development) there were 12,470 creches in 1991-92 serving about three lakh children. These figures, which include both statutory and voluntary creches, do not specify the numbers of children in each group, nor the number of working mothers. Another estimate [Swaminathan 1991] indicates that about 2.5 lakh children are found in 10,000 creches in the voluntary sector and only about 50,000 children are in creches in the statutory sector. No specific information is available about the numbers of children in the age groups 0-2 years and 2-6 years in either sector.

In the statutory sector alone, it is estimated that three lakh 'entitled' women (with six and a half lakh young children) are covered by the existing laws. Thus the number of statutory creches is very inadequate in relation to the number of children involved. Still worse, they are often found more in name than in actuality, especially in relation to mines, factories, and contract labour, though there are some outstanding exceptions among industrial creches. The best record as far as provision for infants close to the mothers' place of work is concerned, is in the plantation sector in South India [Swaminathan 1985].

Many or most of the creches in the voluntary sector have the following characteristics [Swaminathan 1985]: (a) they do not operate for the whole day nor do their timings coincide with the working hours of mothers; (b) they usually do not cater to children below two years of age; and (c) they are not located in close proximity to mothers' work-places.

The largest Indian child care programme, Integrated Child Development Services, has no day-care component except in Tamil Nadu and Kerala [Swaminathan 1990] nor does it provide custodial care even for short periods to children below two years. Creches run by municipal and local authorities exist in some places, but the number is too low to be of significance. There is no estimate of the number of creches in the private sector, or of children/mothers availing of their services. Little is known about the nature of services for infants in private creches, either, with the exception of a few micro studies [Nakhate-Datta 1987]. Available information

indicates that they are more likely to be found in residential areas than near the work-place.

Appendix II

Comparative Review of Laws and Policies Relating to Maternity and Child Care

A compilation by ILO of legislation and policies regarding pregnancy, maternity, infant feeding and marketing of breast milk substitutes in 135 countries provided the data base for this overview. Sharp contrasts can be observed between the practices of the socialist (present and former) and market-oriented countries, as well as a growing divergence in trends between the industrialised countries, where employment is preponderantly in the organised sector and the developing countries, where the informal sector predominates. This review will consider the data for the developing and industrialised countries in turn.

The countries of the developing world can be categorised into four groups, on the basis of the practices followed in this regard

(1) Standard practice: The majority of countries in the developing world provide three months (or 12 weeks) of maternity leave, most frequently divided up into six weeks before and six weeks after childbirth. This group includes India, and most of the market-oriented countries as well as a few socialist countries—Brazil, Jamaica, Peru, Mexico and several other large countries in Latin America and the Caribbean, other south Asian countries, most of the African and Arab countries and several other Asian countries fall into this group. In almost all maternity benefit is at 100 per cent of wages with protection against dismissal during maternity leave. However, a few countries provide much less—Argentina, Ecuador, Iraq and some other Arab countries like Kenya, Mozambique, the Philippines, Sudan, Uganda, Singapore and Thailand.

(2) Increased emphasis on post-natal period. Some of these countries have begun to recognise the importance of providing more leave in the post-natal than in the pre-natal period and have divided up the 12 weeks leave in different ways, for example, Indonesia, Madagascar, Nicaragua, Trinidad and Tobago, (4 weeks before and 8 weeks after childbirth); Haiti (4 weeks before, 6 weeks after and 2 weeks either before or after, at mother's choice); and Sri Lanka (2 weeks before and 10 weeks after).

(3) Extension of post-natal leave: Only a handful of countries have taken steps to provide full three months maternity leave during the post-natal period. These include: Costa Rica (4 weeks before and 12 weeks after); Chile and Cuba (6 weeks before and 12 weeks after); Egypt (12 weeks after, pre-natal not specified); and Niger (2 weeks before and 12 weeks after).

(4) Socialist practice: While most of the socialist countries in the developing world (such as Cuba, Ethiopia, Nicaragua) fall into the above three categories, China and Vietnam are outstanding in their different approach to maternity and child care. In China, maternity leave ranges from six to 12 months, but at less

than full wage; and it is reported that many mothers prefer to return to work earlier in order to earn the full wage. In Vietnam, maternity leave is provided for four months after birth. Details about the extent of benefit and pre-natal leave, etc, are not available at the time of writing. In both countries there is an extensive network of creche and child care centres.

The significance of the facts outlined above can be appreciated in the context of the following observations: (1) In most of the developing world, the majority of women are working in the informal or unorganised sector, and hence the type of provisions described above would apply to only a minority, more specifically to those working in government and in large public and private sector concerns. (2) Most of these countries (several of which are ex-colonies) have borrowed their legislation from the industrialised countries, and few have made serious efforts to develop new laws more appropriate to their own economies. (3) Several are now making adaptations, mostly by providing for extension of leave beyond the period statutorily provided, for varying periods, and at varying levels of benefit. This is the most encouraging approach so far and the one most commonly being adopted. (4) In many of these countries, legislation regarding creches and nursing breaks has also been borrowed from industrialised countries, and hence creches and nursing breaks are legally required in units employing more than a certain number of women. However, creches are very little developed in most of these countries and where they do exist, they are not observed to meet the needs of infants. (5) It is surprising that most of the socialist countries in the developing world are not much in advance of others in this respect, in spite of the importance theoretically attached by them to women's liberation and participation in the workforce. In China, maternity provision must be seen in the light of the emphasis on the one-child-family norm. Also, it must be noted that actual implementation is more likely among government cadres and public workers, and in urban areas and large establishments. There is evidence that child care provisions have been rapidly eroded in the last decade.

The industrialised countries can also be grouped into four categories in terms of provision for maternity and child care. All of the socialist countries provide for fairly long periods of maternity leave at full pay, with job security and provision for extension of leave, as well as work-place nurseries and creches, e.g. Bulgaria (4 months post-natal with possible extensions for first child and more for subsequent children); Czechoslovakia (22 weeks post-natal for first child with possible extensions and more for subsequent children; also additional for single mothers); Hungary (20 weeks with not more than nine weeks of these pre-natal, and possible further extensions); Poland (16 weeks for first child and more for subsequent children); Romania (14 weeks of which at least seven must be post-natal); USSR (former) (18 months post-natal); Yugoslavia (6-12 months post-natal with possibility of half-time work up

to two years). These findings relate to the pre-1989 period, and in the light of the sweeping political developments of the last three years and fundamental changes taking place in the former socialist economies, it is not yet clear how these provisions will be or have already been altered.

Scandinavian countries, which have the highest per capita incomes in the world and a long history of welfare-oriented socialist governments, provide long maternity leave but at less than full wage and have of late moved to providing parental leave which can be taken by either parent. E.g., Denmark (20 weeks post-natal, 10 of which may be taken by either parent, with further parental leave up to two years); Finland (35 weeks post-natal, 2 of which may be taken by either parent, with supplementary unpaid leave up to one year); Norway (18 weeks, up to 6 of which may be pre-natal, 12 of the total may be taken by either parent, supplementary unpaid leave available); and Sweden (84 weeks, most of it available to either parent).

Western European countries which form part of the EEC have wide variations among them, with western Europe setting the pace. Most pay less than full wages during the leave period. Examples: France (16 weeks with additional for breast-feeding mothers); Germany (26 weeks, and up to 3 years parental leave), and Italy (48 weeks with up to 26 weeks parental leave, and supplementary leave for 6 months).

Anglo American countries which include Britain, Canada, Australia, New Zealand and the US, have the least favourable provisions in the developed world, with the US undoubtedly at the bottom. Australia (from 6 weeks up to one year, but mostly unpaid); Canada (37 weeks at 60 per cent pay for Federal government employees, unpaid leave only for provincial and local government employees, and 15 weeks in the private sector); New Zealand (26 weeks, at least 20 after birth, at allowances equal to sickness benefit); UK (44 weeks starting at 90 per cent wages for the first 6 weeks, with levels of benefit declining over the period); and the US (no maternity policy as such, left to private arrangements and usually based on earned leave. In some states, provision available as pregnancy disability). In the US, job protection is available only to a limited extent under the Pregnancy Discrimination Act, elsewhere, jobs are protected.

The laws in these countries have evolved over a period of time, as an expression of basic social philosophies and in response to social movements; in western Europe and Scandinavia, maternity and child care policy has to be seen in the context of dwindling family size and official population policy promoting a higher birth rate, universality of nuclear families as well as increasing incidence of single-parent families, and influence of powerful labour and women's movements in shaping social policy. In consequence, it can be observed that there is a substantial provision for creches and child care facilities. A relationship can also be found between the concept of extended parental leave and the minimum age of entry to child care centres, legally or conventionally defined.

In the socialist countries, the policy of liberal maternity benefits and extensive provision for creches and child care services has been a basic plank of social policy since the Communist Revolution, and was an expression of the socialist commitment to the liberation of women and to the active participation of women in economic, political and social life. The kind of changes likely to take place in the former socialist countries are as yet unclear. Sadly, the Anglo-American tradition, which gives least importance to state intervention for the protection of mother and child, and leaves everything to market forces, is the one which seems to have been the model for most of the developing countries.

DISCUSSION

Subsidies in Higher Education

M Govinda Rao

TILAK (1993) in his criticism of the analysis of subsidies in higher education contained in my paper [Rao 1992] raises three questions, namely, (i) what is the cost recovery rate? (ii) what should be the cost recovery rate? and (iii) how should it be achieved? In his view, the recovery rate estimated in Rao-Mundle (1992) is an underestimate; the suggestion made in Rao's paper to charge economic prices is not based on sound principles of public finance; and the method recommended to effect higher recoveries is inappropriate. Debate on these questions is most welcome. If nothing else, it at least calls attention to the misallocation of public resources within education. However, Tilak's comments are merely assertions, not based on any logical reasoning. Nor does he show much awareness of the conceptual framework employed in the studies on subsidies to which he has referred to. However, in order to ensure that readers are not misled, some clarification on the data sources and the conceptual and methodological framework employed in my paper is necessary.

Tilak's main argument relates to the estimate of cost recoveries. He asserts that the concept of recovery rates is not explained anywhere in my study and that the budgetary data used to estimate cost recoveries are less reliable than the data

put out by the department of education of the ministry of human resource development. It is argued that the estimate of cost recovery computed on the basis of the latter source is appreciably higher than my estimate. Tilak, however, does not provide any argument for rejecting the budgetary data in favour of the data published by the education department. He merely asserts that he 'considers' the latter to be more reliable. He states (p 246), "Even though I cannot explain the huge difference between the department of education data and the data given in the finance accounts, I feel that the former are more reliable and appropriate for such an analysis than the latter" This is hardly a basis for rejecting an alternative data source in any scientific research. While there is always room for improvement in most data sources, it is preposterous for anyone to claim that the data on actual receipts and expenditures of government departments presented to the state legislatures and audited by the comptroller and auditor general is, for unstated reasons, less reliable than the information compiled from the state education directorates by the human resource development ministry. Not is it proper to discard one data source when the difference between the data sources are not understood.

Equally regrettable is the charge that I do not explain the concept of subsidies used in the study. Of course, the paper does not contain the conceptual and methodological details because it is only an overview paper putting together the results of various studies on the states' finances. On the issue of subsidy and cost recovery, the paper simply reports the results estimated on the basis of the concept and methodology explained in detail in Mundle-Rao (1991) and Rao-Mundle (1992). The latter paper, which Tilak cites, clearly states that more detailed discussion on the concept and methodology is contained in the Mundle-Rao paper. The papers have also been discussed rather extensively. It is strange that Tilak should have chosen to criticise the estimates without bothering to read the original paper from where the estimates were drawn and then complain that the conceptual framework and methodology had not been explained.

The computation of budgetary subsidy as defined here involves estimation of two elements, namely, the cost of providing the service and the cost recovery. The cost of providing the service consists of the variable cost (revenue expenditure), interest cost on cumulative capital expenditure and depreciation. Similarly, the recoveries consist of recoveries by way of user charges and interest and dividends (if any) received by the concerned department on the loans given to and investments made in non-departmental entities providing the services in question. The recovery rate is simply the ratio of recoveries to the cost of providing the service.

Thus, subsidy estimated by us refers to the general budgetary support for providing the service, which is the relevant concept from the viewpoint of the taxpayer. The two studies cited above estimate subsidies in respect of 85 sectors and sub-sectors appearing in the central and state budgets and higher education is one of them. The only available source which gives data compiled on a comparable conceptual basis across all governments and departments year after year is the audited Financial Accounts published by the comptroller and auditor general of India.

Though not essential for my reply to Tilak, it is interesting to explore the mystery behind the large differences between the budgetary data and data published by the education department to which Tilak has referred to. The expenditure and revenue figures published by the education department cover all recognised educational institutions, including government institutions as well

as private aided and unaided institutions. Recovery rates in capitation fee colleges and other unaided private institutions are obviously quite high (over 100 per cent). However, from this it would be highly misleading to conclude that recovery rates are equally high in publicly provided education.

The next important question is what should the recovery rate be? The arguments put forth by Tilak for subsidising higher education make curious reading. He states that marginal cost pricing cannot be applied to education "...due to positive externalities, merit goods characteristics including lack of information and lack of income, the public goods nature including non-excludable character of benefits of higher education, decreasing average cost, and market failures" (p 247). In short, he has cited the entire list of conditions under which public intervention is desirable without bothering about which conditions apply to education. For example, if higher education indeed satisfies the non-exclusion characteristic of public goods, how can it be priced at all?

I had in my paper argued that economic pricing is necessary both for reasons of efficiency and augmenting resources. If one understands the conceptual framework detailed in the papers cited earlier, it becomes clear that I am not arguing for a marginal cost pricing rule, but merely stating that prices should be fixed fairly so that consumers are enabled to consume optimal quantities of the service. Higher education does involve significant externalities and subsidisation in its provision is definitely necessary. But consumers ought to pay a price which is commensurate with their annualised private benefits. At the same time, the poor should not be denied access to higher education merely because of their lack of purchasing power and for this appropriate financing mechanisms will have to be found.

On the question of effecting higher cost recoveries, while Tilak also agrees that it is necessary to raise fees, he considers the proposals put forth in my paper as unreasonable. In my view, broadly, the pricing of higher education must be done keeping in view the private consumption and investment benefits of the service on the one hand and the degree of externalities and merit good elements on the other. There is no operational method of quantifying these elements and therefore judgments are unavoidable. It may be noted that, in 1987-88, even when the proportion of illiterates was over 60 per cent just about 40 per cent of the outlay on education had been allocated to elementary education. With this, not only that

universalisation of elementary education has remained a dream but even the quality of publicly provided education has been abysmally poor. The deprived illiterates surely do not have access to higher education. Further, the existence of private institutions providing better quality elementary education to those who can afford has ensured better access to the highly subsidised higher education, particularly in scientific, technical and professional institutions to the affluent sections. It may be noted that estimates by Guhan (1992) show that subsidy per student at higher levels of education in 1988-89 (Rs 3,704) was over eight times that of elementary education (Rs 449). Indeed, enabling access to higher education to the currently deprived categories can be achieved only through substantial increase in the outlay at the elementary level. Although subsidy does have an important role in providing higher education, there is surely a case for substantially reducing it from the current levels. At the same time, the poorer sections should be provided with greater access to higher education through scholarships and loans.

Tilak argues that there are more efficient forms of cost recovery than the one suggested by me. In fact, I have only suggested reduction in the budgetary support and had mentioned that the individual institutions should be given adequate flexibility to make adjustments thereafter including raising of fees. Of course, within this approach differentiation among different levels and types of education can also be made. It is also possible to make differentiation on the basis of incomes as suggested by Tilak, but I would be hesitant to suggest this to avoid complication and misuse. However, this is not to deny that better methods of subsidising education can exist, but unfortunately the one suggested by Tilak is certainly not one of them.

[The author would like to thank Sudipto Mundle for useful discussion without implicating him in any manner.]

What Ails Bangladesh?

While it is convenient for the IMF and the World Bank to blame successive governments in Dhaka for their failure to implement reforms and for the current Bangladeshi regime to attribute the poor results to malfeasance of its predecessors, the decade-long economic stagnation experienced by the country needs more substantive diagnosis. 925

Changing Focus

There has been a political awakening among the dalits in Karnataka in the last 15 years which has made them the target of new and varied atrocities. What happened in the small village of Badanavala in March illustrates this trend. 911

Dalits have become a major focus of attention of the Hindutva forces. In Maharashtra, the December riots were characterised by concerted attempts by the Sangh Parivar to draw dalits into its fold. 903

Weak Roots

Whatever be the gains of the literacy campaigns, they will be difficult to sustain without mass participation in programmes of social and economic development and without the universalisation of primary education. 914

While West Bengal has been one of the big spenders in education, it continues to trail other states in literacy rates. 919

By the People...

People's movements are essential to set right the many ills that infest the body social of which the body politic is a vital part. They are needed particularly to impress upon elected representatives that real power in a democracy rests with the people and that an errant, corrupt government will not be tolerated. 933

Mismanaged

The government by its ham-handed action in preventing Kashmiri leaders from going on Haj pilgrimage has only helped in communalising the entire issue here and abroad. 896

Promoting Backwardness

In regions like Orissa, where agriculture is the *sine qua non* of economic development, the new economic policy's silence on land reforms, among other things, will have a detrimental effect on growth. 939

Failure of Science

Scientists and technologists cannot remain unconcerned about the fact that their endeavours have failed to draw Indian farmers out of their superstition-bound world. 913

Murky Waters

The swallowing of Tata Oils, Kissan Products and Godrej Soaps is only the precursor of more exciting events. It heralds the country's first slightly hesitant steps towards a *comprador* future. 901

Victims Forever

Victims of the Bombay riots continue to be the target of various arms of the state—the police, the Bombay Municipal Corporation and the forest department—all of which have a nexus with the Shiv Sena. 908

LETTERS TO EDITOR

Koyyuru Incident: Another View

THOUGH it was 'yet another kidnap', the Koyyuru incident is peculiar in that the leaders of the APCLC left behind their earlier viewpoint—the civil rights angle—to wed themselves to the cause of human rights. Earlier, the APCLC leaders have gone on record stating that the organisation was born in order to protect the civil rights of the people. Since civil rights are guaranteed to the people by the state, it is only the state which can violate civil rights. The state has many mechanisms for violating human rights. Therefore, a group dedicated to the protection of the civil rights of the people was necessary and this group had to maintain a crime audit of the state. But Koyyuru inverts the earlier stand.

According to Kannabiran (March 20-27) an intervention on the part of the APCLC leaders was necessary in order to prevent the state from inflicting large-scale violence in the process of securing the release of the hostages. If so, then who were the APCLC going to have talks with? Which party needed to be persuaded against precipitating the situation, the government or the Naxalites? The APCLC chose the latter. When the APCLC believes that the PWG is a political organisation and not a bunch of mindless mercenaries, and that "the government's utter disregard for the Constitution and failure to perform its fundamental obligations have been largely responsible for the spread of the Naxalite... movement in the state", the least the leaders of the APCLC could have done is to press the government to hold political talks with the PWG. When the government has utter disregard for the judicial process and adopts extra-judicial methods to deal with a political problem like Naxalism, kidnaps could at worst be termed as counter-offensive. Who knows better than the APCLC about the police and paramilitary atrocities on the Naxalites—the fake encounters, the torture, the lock-up deaths, the rapes, the razing down of entire villages, etc? And a man pushed to the brink is a desperate and violent man. Given all this, it is only fair to bring pressure on the government.

Kannabiran does not throw light on what Koyyuru signals loud and clear—the contradictions within the government, which was clearly exposed. While in the earlier kidnapping cases like Gurthedu and of Sudhir Kumar, the state administration moved heaven and earth, in the case

of Balaraju, a tribal MLA of the ruling party itself, the government showed no concern. The resignations rendered by some ruling party MPs and MLAs, the dharnas and the general unrest in Koyyuru and Narsipatnam show not only the tribal resentment towards the government's inaction but also the contradictions within the ruling party. In persuading the people to withdraw these protests, the APCLC did a world of good to the government by removing the pressure which the people had put on it. It would seem that the high priests of the APCLC were acting on the government's behalf.

The government could only hope that the PWG dalam would kill Balaraju, which would turn the tide against the PWG. But that was not to be. The Naxalites proved that their concern for tribals is greater than the government's 'concern' by releasing Balaraju and others unharmed, even before Ranadev could be set free by the government. When one looks into the history of PWG kidnappings, only two persons—Malabar Rao, a Mandal parishat president and Sankariah, a MLA, were killed after being kidnapped. All other hostages have been released unharmed. Persons, especially from the backward classes, have been released even when the government has not accepted the demands of the PWG.

Ranadev's release by the government cannot be attributed to such innocent reasons as the 'Rayalseema ethic' of Vijayabhaskara Reddy, as Kannabiran naively believes. The CM realised that his

last chance to refurbish his party's image before the Panyam by-election and preserve that last shred of his torn image among the tribals was by releasing Ranadev. Moreover, owing to the keen interest and urgency the government will have to show in the case of a future kidnap of any important person from the ruling class, care was taken by Vijayabhaskara Reddy in order not to set the 'wrong' precedent of not releasing Ranadev. Surely, such scheming tactics cannot be owed to ethic. What happened to ethic when Ranadev's voice on the AIR broadcast was mimicked? It was indeed shocking to see that the APCLC did not condemn the violation of Ranadev's rights as a prisoner. Nor does Kannabiran mention the other cases that were hurriedly foisted on Ranadev even while bail applications were being moved in Maharashtra and Warangal. Besides calling Vyas a 'well known police officer', the article, like the AIR broadcast of Ranadev's voice, misrepresented Ramanna's intentions.

There has been debate within the APCLC for sometime on whether it should maintain the crime audit of only the state or of both the state and other organisations like the PWG. The latter has prevailed over the past one year. One can only hope that the APCLC does not go a step further to maintain the crime audit of only the PWG and acquit the government of all its crimes.

At the Cost of Development

IT was good to see finance minister Manmohan Singh, in his speech at the annual session of the Confederation of Indian Industry (CII), raising some issues of long-term economic growth which have so far remained neglected in the enthusiasm for structural adjustment and economic liberalisation. Manmohan Singh outlined some of the major tasks facing the economy and emphasised the special responsibility cast on private industry and trade which, as he pointed out, are enjoying the gains of liberalisation and privatisation.

The issues raised by the finance minister are undoubtedly of great importance to the long-term development of the economy. For instance, he underscored that the country would not be able to meet the investment requirements of annual economic growth of 5 per cent unless the saving rate was substantially raised. The current saving rate of 20 to 22 per cent compared poorly with the rates of 30 to 35 per cent achieved by countries which have recorded impressive rates of economic growth. It is interesting to hear this piece of conventional wisdom from the finance minister since the cheer-leaders of the so-called economic reform have been telling us that what is needed is not more saving but better use of saving through improved capital-output ratios. The corporate saving rate specifically has been abysmally low in this country and so the finance minister's reminder to businessmen to generate internal resources in larger measure was very much in order. The corporate sector likewise has a pivotal role in boosting exports. Large industries have been generally net users of foreign exchange, while the major effort in expansion of exports in recent years has come from small and medium entrepreneurs. Third, the finance minister told his audience that his ministry's studies had confirmed the fact of large-scale evasion of both direct and indirect taxes. If tax compliance were better, there would be no need for constant tinkering with tax rates and there would be a stable tax regime. Fourth, the finance minister asked private industry to moderate its preoccupation with short-term gains and invest in areas such as research and development for long-term benefits. Fifth, the corporate sector was asked to help rural development by initiating the use of modern technology in agriculture and water harnessing—as he put it, “whether we like it or not, political power has shifted from the professional middle class to the middle peasantry”.

While these issues are important, the question really is how far the structural adjustment policies that the finance minister has initiated and vigorously pursued will contribute to the achievement of these goals. Or will the finance minister's policies in fact take the economy in

quite the opposite direction? Taking the domestic saving rate, the present government's entire policy package is directed towards encouraging conspicuous and unproductive consumption. Sharp reductions in import and excise duties, special encouragement of production of consumer durables, even with foreign investment, and liberalised import of gold and silver cannot but inflate overall consumption in the economy. The finance minister possibly entertains misgivings on this score himself, which is perhaps why his exhortation to captains of industry to generate more corporate savings. There is now enormous scope for the corporate sector to enlarge plough-back of its profits because the government has over the years drastically reduced the incidence of corporate taxation. Tax provision as percentage of profit before tax has now come down to about 26 per cent from over 45 per cent only four or five years back. This has, of course, meant massive loss of tax revenue to the government and yet the savings of the corporate sector have not risen beyond a miniscule 0.5 per cent of GDP. And despite the finance minister's appeals, they are unlikely to show much improvement, partly because the high interest rates dictated by the government's monetarist policies are eroding corporate sector surpluses, but more importantly because overall corporate profitability is conditioned by the narrowness of the domestic market—something for which the reform zealots have no eyes or ears. The economic reform and structural adjustment policies are in fact likely to further worsen disparities all round—regional, rural/urban and inter-personal—and in the process further narrow the demand base for a wide variety of industrial goods in the economy. Certainly, it would be futile to expect the private sector to generate sufficient industrial employment to make a worthwhile contribution to widening the economy's demand base. There is, therefore, nothing paradoxical about the coexistence of high-pitched capital market and financial sector operations with sluggish real sector activity in regard to industrial investment, output and employment.

Likewise, the finance minister's attempt to cajole private industry to help rural development is a sign of helplessness on the part of the government in the face of the severe cuts in rural development programmes. Investment in agriculture and rural infrastructure as also public expenditure on health, education and other social sector activities have all suffered and the resultant damage to the rural economy has been extensive. Manmohan Singh's own three budgets have only served up rhetoric in place of policies and action in regard to rural development.

KASHMIR

Loutish Intervention

EVERY ham-handed action by the government provides its enemies with a handle. The latest instance is the last-minute ban clamped on some pro-secessionist Kashmiri leaders, preventing them from proceeding on Haj pilgrimage. The manner in which it was done is typical of the bureaucratic gaucherie for which India is notorious.

The leaders—Syed Ali Shah Geelani, Maulvi Abbas Ansari and Mian Abdul Qayum—were stopped at the Indira Gandhi international airport just before they were to board their plane. The official explanation given was: these leaders were going to Saudi Arabia to join a Pakistan-sponsored meeting on the Kashmir situation during the pilgrimage there. Going by reports, it seems that home ministry officials had panicked following rumours that Sardar Abdul Qayum, the premier of Pakistan-occupied Kashmir (PoK), was planning to hold a meeting on Kashmir in Saudi Arabia during the Haj.

The external affairs ministry appears to have been totally ignorant of the home ministry's fears all these months, during which it went through the usual process of clearing the formalities necessary to allow these Kashmiri leaders to proceed on their pilgrimage. The latter first made the necessary applications through the divisional commissioner in their state as far back as September last year, on the acceptance of which they paid the required amount of money and submitted their passports to the authorities. When they arrived in Delhi on the eve of their departure, they were cleared and were even given the immunisation shots—the final formality necessary for departure. It was only when they were to take their flights on May 5 and 6 from Delhi that they were stopped and unceremoniously told that their passports had been revoked under the Passports Act.

The heavens would not have fallen if these Kashmiri secessionist leaders had met their counterparts from PoK in Jeddah. In any case, they surely do not have to go all the way to Saudi Arabia to establish contacts with people in PoK, their next door neighbours. As for their declared objective—secession from India—they have made no bones about it, and their reiteration of it, made whether in Srinagar or Jeddah, would have made little difference. So, what does New Delhi gain by preventing them from going on their pilgrimage?

The only likely fall-out from the bureaucratic bungling of the entire situation is yet another nail in the coffin of India's much advertised commitment to

secularism. Quite predictably, immediately after they were prevented from proceeding on their pilgrimage, one of the Kashmiri leaders, Maulvi Abbas Ansari, said: "It is interference in our religious affairs by a country claiming to be secular". At a press conference in Delhi, soon after the incident, these leaders gave a call for a worldwide protest day by the Muslims on May 14. By its loutish intervention in a delicate situation, the government has simply helped in communalising the entire issue, both in India and abroad.

The Organisation of Islamic Countries (OIC) has already threatened to impose restrictions on scientific, cultural, manpower and other exchanges with India in protest against New Delhi's policy on Kashmir. The latest action by New Delhi (in preventing some Muslim leaders from going on Haj) will further help the 'hawks' in the OIC to mount an international campaign against New Delhi, which is already reeling under the aftermath of the Babri Masjid demolition—a scandal that has almost demolished India's secular credentials before world public opinion.

EXCHANGE RESERVES

Exaggerated Claims

THE government has been patting itself on the back over the rise in the level of the country's foreign exchange reserves in the last few weeks. Foreign currency assets plus special drawing rights (SDRs), which were the equivalent of \$ 5,278 million at the end of February, had gone up to \$ 7,027 million by the end of April, a rise of \$ 1,749 million in just two months, \$ 1,467 million of which came in March (between February 26 and April 2) and \$ 723 million in the week ended April 2.

Official spokespersons have missed no opportunity to attribute the growth of foreign exchange reserves to the success of the government's liberalisation policies, particularly the unification of the exchange rate from the beginning of March. Replying to the debate on the 1993-94 budget in the Lok Sabha, the finance minister claimed that "foreign exchange reserves had touched \$ 7 billion, the highest in 20 years, with only \$ 2.5 billion of it coming from borrowed funds."

Without detailed information on the inward remittances or, alternatively, on the Reserve Bank's sales and purchases of foreign exchange, both for normal transactions and for market intervention, it is not possible to pronounce on the factors leading to the build-up of reserves. But to attribute it entirely to a larger flow of remittances and export receipts in response to the new exchange rate policy is not convincing. In the first place, a

sizeable rise in foreign exchange reserves in March has been a regular annual phenomenon, except in 1990 and 1991 which were unusual years. There was thus an addition of \$ 1,469 million to reserves in March 1992; and of \$ 1,068 million in March 1989. Second, due to the recession in industry, the level of imports has been much lower than anticipated. Against the expectation of an import level of \$ 25 billion in 1992-93, actual imports during April-February 1992-93 were only \$ 19.95 billion. The cumulative rate of increase of imports (in dollars) was 22 per cent during April-September 1992, but it came down to 13 per cent during April 1992-February 1993. Despite the sluggish growth of exports, if, as the government has been claiming, the Reserve Bank has had to intervene in the market to prevent the rupee from appreciating, the explanation is the recession in the economy. Finally, for all the brave talk about the strength of the rupee, it is well known that the government has sought to regulate the release of foreign exchange to finance bulk imports, such as of petroleum products. This is not to say that there has not been faster repatriation of export proceeds and larger inflow of remittances through official channels. But this is not all a matter of the new exchange rate policy; the depressed state of the economy has contributed significantly to the relatively low premium on foreign currencies in the 'havala' markets.

In the same vein, the contention that borrowings accounted for only \$ 2.5 billion out of the total foreign exchange assets of \$ 7 billion is questionable. Foreign currency assets rose by \$ 3,395 million in 1991-92, from \$ 2,236 million to \$ 5,631 million, and almost the entire increase was due to special factors like exceptional financing, transactions with the IMF and the India Development Bonds (net of FCNR withdrawals). In 1992-93 there occurred an increase in foreign currency assets of \$ 746 million and there has been a further rise of \$ 542 million since the end of March, or a rise of \$ 1,246 million taken together. Against this, during this period drawals from the IMF alone have aggregated \$ 1,631 million. Besides, during April-December 1992, there was an aggregate drawal of \$ 625 million of fast disbursing funds (\$ 200 as the last tranche of the World Bank's structural adjustment loan, about \$ 100 million from the World Bank as safety net loan, \$ 150 million from the ADB under financial sector financing, \$ 125 million from Japan under hydrocarbon sector loan and about \$ 50 million from Germany). It passes comprehension, therefore, how the finance minister could have claimed in parliament—without a single questioning

voice being raised—that only \$ 2.5 billion of the current foreign exchange reserves of \$ 7 billion represented borrowed funds.

COMMUNIST CONCLAVE

A Matter of Credentials

A correspondent writes:

THE CPI(M)'s ideological initiative at the international level has naturally attracted attention in Indian political circles. This is perhaps the first occasion that a number of communist parties from different parts of the world, including the three ruling parties of Cuba, Vietnam and North Korea, are getting together to discuss the problems and prospects of Marxism in the light of the collapse of 'actually existing socialism' in the Soviet Union and east European countries. Though professedly only a seminar and not a conference, yet an exchange of opinion even at the academic level need not be entirely fruitless, provided of course the participants have done some honest homework. This, however, is not in evidence as regards the host party. One should not still prejudge the value of the Calcutta exercise, but wait for the papers and documents.

In the domestic sphere, however, the exclusion of the CPI(M)'s two Left Front allies, RSP and Forward Bloc, from the seminar, while including the CPI, has created some problems. The CPI(M) general secretary, H S Surjeet, has justified the exclusion on the ground that the two parties are not 'communist'. They certainly do not flaunt that label in their name, though they claim to profess Marxism, the quintessence of a communist party. If practice, instead of profession, is to be the chief criterion, then the question arises if the CPI(M) or any other credible agency has recently undertaken the job of evaluating the role or the character of the parties actually invited. At least with regard to the CPI on the invitee list, the two excluded Left parties may raise the credible caveat that during the Indira era for years this party served as the miserable tail of the bourgeois government.

According to a press report the Forward Bloc general secretary Chitta Basu, MP, was not even invited to a dinner thrown by the host party in honour of the foreign guests, although the top RSP leader had got the invitation and declined it. Basu, however, jocularly remarked that the only invitation he had received from CPI(M) quarters was from Somnath Chatterjee, MP, in connection with his two grandsons' 'thread' ceremony. This casual revelation, however, raises questions about the communist character of the host party

itself. These days, of course, a communist does not have to abjure religion or theistic faith. But the thread ceremony is not a matter of theological faith, but a ritual affirming faith in varna and caste. The CPI(M), which these days has made Swami Vivekananda, the fiery denouncer of the varna and caste system, one of its chief mascots, has someone as one of its chief spokespersons—Chatterjee is the leader of the CPI(M) in the Lok Sabha—who still practises the rituals and flaunts the symbols of caste hierarchy. How Marxist is this Marxist communist party?

THE CAG

Eye for Changing Fashions

DO the audit reports of the Comptroller and Auditor General (CAG) on the finance accounts of the union government and the reports of the test audits of individual ministries and departments have any effect on the management of government finances? Not much, it would appear. The management of government finances has gone steadily downhill even as there has been a steady flow of audit reports highlighting lapses, irregularities and outright fraud. Among recent reports, the one on the finance accounts of the union government (civil) for 1991-92 and the audit of appropriation accounts deserves to be noted.

The auditors are at their best when they concentrate on their areas of professional specialisation, but when they get into examination of the broader economic implications of fiscal operations they are quite often out of their depth. The line between economic and auditing issues, it may be argued, is thin and an auditor cannot be said to have done his job satisfactorily without taking a broader view of fiscal operations. This may be so, but the temptation to pass value judgments based on economic interpretations of fiscal data is best resisted.

A few examples stand out in the CAG's *Report on the Finance and Appropriation Accounts for 1991-92 (No 1 of 1993)*. First, the report attempts to relate fiscal variables such as tax revenue, capital expenditure, debt and fiscal deficit to gross domestic product (GDP)—and that too to GDP at factor cost at current prices instead of GDP at current market prices. Now, what audit lesson is to be derived from the observation that "tax revenue as a percentage of GDP has tended to decline"? Likewise, it is not the fiscal deficit to GDP ratio that is so relevant as the purpose for which the deficit is

incurred. Some circumspection is called for on the part of the CAG in using such economic variables. Secondly, there is a reference in the report to the monetised deficit. Quoting (not altogether accurately) the report of the Committee on the Monetary System to the effect that "an unambiguous, and economically meaningful measure of the monetary impact of fiscal operations is provided by the change in RBI credit to the central government", the CAG cites figures from the Reserve Bank's *Annual Report* as indicating a sharp fall in the monetised deficit in 1991-92. The logic of this fall, attributable to the stabilisation programme associated with the IMF's stand-by loan, is not beyond question. Likewise, the use of the gross fiscal deficit concept began after the IMF programme of fiscal compression had been accepted by the government. The CAG, who had made no reference to the concept till two years ago, now faithfully echoes the IMF/World Bank view that the gross fiscal deficit is "an index of overall financial market disequilibrium caused by the fiscal (borrowing) operations of the government". Some years back the CAG's reports had unquestioningly accepted the goals set out in the then government's Long-Term Fiscal Policy (LTFP) statement. Quoting the LTFP, the CAG used to argue till last year that prudent fiscal management demanded that revenue receipts should not only meet revenue expenditure but also leave a surplus for financing the Five-Year Plans. In its report for 1990-91, the CAG had taken the government to task because the revenue deficit had turned out to be Rs 18,561 crore compared to the Ninth Finance Commission's projection of Rs 14,500 crore for the year. In the latest report, however, there is no reference to the revenue deficit at all. It is a different tune now. Following the IMF/World Bank formulation, the CAG is at pains to point out how the rising fiscal deficit had resulted in growing internal and external indebtedness which constituted 67 per cent of GDP with the interest burden amounting to 4.9 per cent of GDP and 23 per cent of revenue expenditure in 1991-92. Such eagerness to adjust its sails to the prevailing winds does not go to enhance confidence in the CAG's objectivity and independence.

This is not to belittle the importance of the CAG's reports which provide interesting data and critical reviews of many aspects of government finances. For instance, the section in the report under discussion on government investments in government companies and corporations and the returns on them is quite revealing. It is pointed out that the return of around 0.92 per cent from 239 statutory

corporations and public sector undertakings accounting for a substantial government investment of Rs 40,121 crore has to be viewed against the government's average borrowing rate of 10.2 per cent in 1991-92. No dividend was received from 187 public sector undertakings in which Rs 36,189 crore were invested up to 1991-92. The picture would have been more complete if the report had also provided information on the interest received from PSUs and other undertakings on the debt capital supplied by the government.

Another piece of useful information in the report relates to the valuation of external debt. The budgetary documents present the rupee value of external debt at historical rates of exchange. The CAG's report points out that while at historical rates of exchange the outstanding external debt at the end of March 1992 was Rs 36,948 crore, at the current rate of exchange it was no less than Rs 1,09,608 crore, that is, almost three times as large, which measures the additional burden on the budget as a result of the depreciation of the rupee. The outstanding external liabilities at historical rates of exchange as a percentage of GDP at current market prices was 6.1 per cent, whereas at the current rate of exchange the ratio was 18 per cent.

BANGLADESH World Bank Prescriptions

IN the context of the World Bank's rapidly increasing involvement with the Indian economy, its interference with the pharmaceutical sector in Bangladesh is of significance. As is well known, multilateral aid agencies as well as international bodies including the World Health Organisation have been tardy in giving due recognition to the country's innovative and radical drug policy. Their never-say-die attitude has given rise to tremendous pressure being put on the government to 'liberalise' the policy. A telling instance was when, following the cyclonic storm which devastated part of the country, aid agencies pleaded with the government to open some doors for easier import of drugs without which medicinal supplies could not be sent into the country. To its credit the newly-installed government refused to give in, subjecting all medical aid to the same rules as imports of ordinary times.

This stringency has, not surprisingly, annoyed agencies like the World Bank which has been pushing for deregulation of the drug industry. In June last for instance, the World Bank resident mission in Bangladesh sent a detailed note to the government on the changes it sought.

These included mainly the removing of restrictions on import of raw materials, controls on prices of drugs and restrictions on the operations of foreign firms.

Most importantly, the World Bank wants the block list system for import of raw materials to go. This was introduced to restrict import of raw materials and to put some control on the practice of transfer pricing, as also to ensure that competitively priced products approved internationally are brought into the country and to avoid dumping of sub-standard high-priced chemicals and intermediates. If the block system were to go it would mean that the very basis of the drug policy is dismantled and pharmaceutical MNCs would reign supreme once again.

According to the Bank the pricing policy "hurts those firms which spend money on quality assurance and maintain good manufacturing practices". Prices, it feels, should be determined by "competitive market forces". Interestingly however, factors like quality control and good manufacturing practice are built into the pricing policy in which mark-up is determined on the basis of level of technology and aseptic requirement and not on the essentiality or otherwise of a drug. Drugs which require simple repacking have a low mark-up while those which need total aseptic facilities for manufacture are allowed the maximum mark-up. Further, companies which have better quality control and follow good manufacturing practice are allowed an added mark-up of 10 per cent on all products on the grounds that these require special inputs.

It is not only the pricing policy which bothers the World Bank. Its note also pleaded for fewer restrictions on advertising and promotion and on the product range allowed to foreign firms. Interestingly though, the drug policy puts no restrictions on advertising other than that all materials should be submitted to the drug controller. Why such controls should "infringe the autonomy of firms and their marketing strategy", if they were ethical, is hard to understand. Similarly, the only two items which the foreign firms are not allowed to manufacture are antacids and oral vitamins which require very simple technology, on the ground that foreign firms are capable of manufacturing more sophisticated items and the quality assurance they are capable of must be put to better use than to manufacture these products. This has of course meant that foreign firms have not been able to push low priority products. Clearly the World Bank's interest is in the financial health of the foreign sector rather than in removing discrepancies in the Bangladesh government's drug policy.

TWENTY YEARS AGO

EPW, May 5, 1973

In well-bred parliamentary democracies the judiciary, like Caesar's wife, is expected to be above suspicion—indeed above everything except discussion of the most polite sort. But accidents happen even in societies of impeccable pedigrees. One seems to have just happened in our own. In the aftermath of the government's decision to supersede three judges of the Supreme Court in appointing the new chief justice, some of the things which have been said by those on either side of the argument will hardly enhance the dignity and majesty of the judiciary.

One of the three judges who have resigned from the Supreme Court in protest against their supersession has accused the prime minister of having worked for his removal from the court. The prime minister, he told a press conference on Tuesday, had been 'greatly piqued' by his judgment in her election appeal and, ever since, her 'agents' had been busy trying to build up a case against him. His speeches in parliament were scrutinised, possibly his telephone was bugged, and a watch was kept on his movements. Turning to the effect of the government's actions on the 'independence of the judiciary', the learned judge disclosed that "we have already several judges who take pride in notifying to the government their qualifications for being considered as 'committed judges'". The number of such judges was bound to increase in the years to come, he added.

If this be an insider's view of the judiciary and of the level at which relations are conducted between the executive and the judiciary, then the picture that emerges must shock those who have taken their Jennings and Bryce to heart. They may, nevertheless, take some satisfaction from the manner in which the legal profession throughout the country has responded to the government's action. With but few exceptions, members of the bar—from former attorney-generals and over-worked doyens of the profession to briefless practitioners in mofussil courts—appear to be agreed that grievous damage has been done to the status of the judiciary and, through that, to the very basis of the political system, by the manner of appointment of the new chief justice of the Supreme Court. However, even the protest of the profession has been rather less than full-blooded. For, apart from the three affected judges, not a single judge of the Supreme Court or any of the high courts, not to mention any one from the lower rungs of the judiciary, has felt moved to press the point by resigning his job. Resignations by those directly affected—they do it all the time in the army—are not very effective in establishing high moral principles.

When it is all over, one may be sure, everyone on both sides will agree that it was a great fight for a noble cause. As the minister for steel, Mohan Kumaramangalam, told the Lok Sabha on Wednesday, the appointment of the new chief justice "will be a landmark in our judicial history in that it has opened up a debate on the rightness or otherwise of the convention [of appointment by seniority] and uncovered the reasons which must move the government in making appointments of this kind".

Jindal Iron and Steel

JINDAL group's Jindal Iron and Steel Company has chalked up an expansion programme and besides plans for investment in other group companies' expansion programme. The proposals as appraised by ICICI are to entail investment of funds of Rs 250 crore, which the company is meeting with a rights-cum-public issue of zero interest fully convertible debentures of Rs 100 each and further with institutional term loans of Rs 15 crore. In addition to the ICICI, SBI Caps, IDBI, Kotak Mahindra and Credit Capital are the lead managers of the issue which is opening on May 10. The public is being offered 1.05 crore FCDs and 27 lakh FCDs are reserved for NRIs. Following this issue, the stake of the promoters (P R Jindal and S Jindal) in the company will stand reduced from 52 per cent to 31 per cent. The debentures issued to the public will be converted into Rs 10 equity shares at a premium of Rs 90 per share and those issued as rights to the shareholders at a premium of Rs 50 per share. The company as it was incorporated in the year 1972 had belonged to the Piramal group. Jindals took it over in 1983 by acquiring a 40 per cent controlling interest for a consideration of Rs 45 lakh. Jindal group now comprises, other than Jindal Iron and Steel, Jindal Strips, Jindal Ferro Alloys, Saw Pipes and Shalimar Paints. Jindal Iron is expanding its steel division's capacity at Tarapur from 1,50,000 tonnes per annum to 3,00,000 tonnes per annum of steel slabs with a matching increase in the capacity of the hot rolling division from 1,50,000 tonnes per annum to 2,80,000 tonnes per annum of coils and plates. In addition, the company is enhancing cold rolling facilities from 20,000 tonnes per annum to 50,000 tonnes per annum. The expansion is expected to be completed by November 1994 and it is to be in production by March 1995.

Aarti Drugs

Aarti Drugs of the Alchemie group of Chandrakant Gogri and Rajendra Gogri is undertaking a programme of expansion together with backward integration at a cost which ICICI has estimated at Rs 12.50 crore. The sources of finance include promoters' contribution to share capital of Rs 2.40 crore, public issue of Rs 3.40 crore, internal accruals of Rs 1.60 crore, rupee loan of Rs 3.15 crore, lease finance of Rs 1.75 crore and capital subsidy of Rs 20 lakh. The share capital funds cover premium amount, as the company is issuing equity shares of Rs 10 at a premium of Rs 30 per share. It is coming into the market on May 12 with an offer of 8.50 lakh shares to the public with ICICI acting as the lead manager of the issue. The company's plant is located at MIDC estate at Tarapur and the expansion proposed covers increase in the manufacturing capacity of MNI from 300 tonnes per annum to 960 tonnes per annum, of MTZ from 96 tonnes per annum to 200 tonnes per annum, of

TNZ from 84 tonnes per annum to 200 tonnes per annum and of DMZ from 90 tonnes per annum to 240 tonnes per annum. Since demand for the anti-diarrhoeal drugs, MTZ and TNZ, is seasonal, it is proposed to export these during the off-season period from November to February. It is also proposed to manufacture 1,200 tonnes per annum of glyoxal and 10,000 tonnes of ammonium sulphate, the former for captive consumption in manufacture of other drugs. Both raw material and plant and machinery are being sourced indigenously. Commercial production is expected in January next. Capacity utilisation to start with will be 67 per cent, rising in 1995-96 to 75 per cent and in 1996-97 to 83 per cent. Corresponding figures of sales are Rs 9.98 crore, Rs 26.58 crore and Rs 28.48 crore. Net profit is placed for the three years respectively at Rs 1.04 crore, Rs 3.16 crore and Rs 4.90 crore, with the EPS to work out to Rs 4.90, Rs 7.40 and Rs 10.

Blue Blends Finance

Blue Blends Finance of the Arya group is to grow out of being a subsidiary of Blue Blends (India) and is to become, by issuing to the public on May 12, 34 lakh equity shares out of an issue of 50 lakh shares of Rs 10 each at a premium of Rs 10 per share, a publicly held listed company. The Arya group has business interests in textiles, dyes and intermediates and household products. Blue Blends Finance started off on incorporation in the year 1985 with portfolio management and took up subsequently the business of inter-corporate deposits, investing the funds raised in group companies (Blue Blends Petrochemicals and Premier Synthetics) and lending the same to other companies. It reported for the year 1991-92 a net profit of Rs 29.71 lakh earned on gross income of Rs 1.19 crore. By going public it is to farm out operations and broadbase activity. Bank of Baroda, having appraised the company's proposals, has estimated requirement of Rs 59.61 crore of funds till the year 1995-96. Provision of this is proposed by the company with issue of share capital at a premium to aggregate Rs 10 crore (promoters contributing Rs 1.51 crore), internal accruals of Rs 19.61 crore and borrowings of Rs 30 crore. Lease and hire purchase finance is one proposal of fresh business, while the company is to engage itself in portfolio management and providing financial consultancy. It has applied to the SEBI for registering itself as category 1 merchant banker. The company is issuing 50 lakh equity shares of Rs 10 each at Rs 10 premium following which the issued share capital will go up from Rs 1.98 crore to Rs 6.96 crore. It is offering 34 lakh shares to the public on May 12 under BoB and Canara Bank as lead managers. The Rs 10 premium on the share capital issue is justified by the company by the equity's book value and EPS respectively of Rs 17.43 and Rs 7.28 on the basis of the working for the first six months (April to September) of the year 1992-93.

Core Organics

Core Organics, a joint sector company promoted by PSIDC with ex-NRI technocrat, Avtar Singh, is setting up a petro-based import substitution chemical project in Industrial F Point, Derabassi, on the Chandigarh-Delhi highway, for the manufacture of benzaldehyde (700 tpa), benzyl alcohol (150 tpa), benzyl acetate (150 tpa), sodium benzoate (150 tpa) and hydrochloric acid (4,500 tpa). The products to be manufactured by the company are vital raw materials for bulk drugs, pesticides, dyestuffs, perfumery, etc. The present demand of the company's main product, benzaldehyde, is estimated to be around 2,200 tonnes per annum and around 700 tonnes per annum is presently being imported. The company has the distinct advantage of being located within 15 kms from the major consumers of benzaldehyde like Alpha Drugs India, Rallis India and Altus Organics. The company's project is in an advanced stage of implementation and commercial production is slated for September this year. The Pollution Control Board and Site Appraisal Committee, etc, have cleared the project and PSEB has also sanctioned a power construction of 250 KW. The project has been appraised by IDBI for Rs 560 lakh and it has also sanctioned a term loan of Rs 235 lakh. To part finance the project, the company will be entering the capital market shortly with 15,20,000 equity shares of Rs 10 each at par, for which necessary clearance has already been obtained from regulatory authorities.

 Notes: (1) Superscript numeral denotes month to which figure relates, e.g., superscript ¹ indicates that the figure is for January and so on.
 (2) Figures in brackets denote percentage variations over the comparable period of the previous year.

Calcutta Diary

AM

The plight overtaking Tomco and Godrej Soaps heralds the first steps in the country's march toward a comprador future. Other facets of globalisation will also, by and by, reveal themselves—for instance, the choice of India as the next main base for the footloose sex-tourism industry.

THE swallowing of Tata Oils and Kissan Products by Unilever and of Godrej Soaps by Procter and Gamble is only the precursor of more exciting events. You cannot enter water and yet be upset by your body getting wet. Globalisation involves a process whereby little integers lose their identity to big integers, otherwise known as transnational corporations. The plight overtaking Tomco and Godrej Soaps heralds the first slightly hesitant steps of the country's march toward a *comprador* future. The hesitancy will disappear once the march gathers momentum: domestic units will get accustomed to being gobbled up by foreign bodies, and the local bourgeoisie will learn to do the pimping for the latter.

Other facets of globalisation will also, by and by, reveal themselves. Consider the following. According to reports, including from the World Health Organisation, the scourge of the acquired immune deficiency syndrome is about to assume epidemic proportions in both Thailand and the Philippines. These two countries were early pioneers. They had opened up their tourist spots for establishing rest and recreation centres for American troops during the epic war of Vietnam. These were also among the countries where military bases, set up by the Americans in the distant fifties and sixties, are yet to be fully dismantled; the principle observed for such dismantlement evidently conforms to the respectable accounting notion of *Fifo*, first-in-last-out. In the circumstances, it is hardly surprising that the human immune deficiency virus was a pretty early arrival in these lands. Once the *comprador* regimes of both countries sized up the implications of the surcease of the Vietnam war, they were forced to do some quick thinking in order to prevent a drop in their invisible earnings. The outcome was a big push to the sex-spliced service industry, otherwise known as tourism. The sort of recreation American military personnel had a liking for was not that difficult to incorporate into national economic planning. Since earning dollars and other precious foreign currency was reckoned as the principal objective of existence, it was easy to construct a general model of economic growth where tourism filled the

role of a major determinant. It was a model of an open system, in which getting rich was child's play: all you needed to do was to turn your girls into whores and your boys into their pimps. The whorehouses that were set up could be called by fancy different names: massage parlours, temples of health, Turkish delights, sauna fountains, what-have-you. Cash-rich tourists, bent on having a bit of fun with exotic oriental girls, would flock from Germany and the United States, Scandinavia and West Asia, even from stodgy Japan. Soon, tourism would be either country's principal foreign exchange earner. Other developments followed. Given the juicy nature of the business, local entrepreneurs were bought up by international cartels, which knew meticulously well how to organise tourist parties from distant lands. The supply and the demand ends of the service industry met; the cash register simply went berserk.

That these days commercialised sex and AIDS constitute aspects of joint supply was however tended to be overlooked in the beginning. Gnosis had to do some catching up with the realities of life. Sex is fun, but HIV is not, and the saturation campaign for condom culture has been of little avail in either Thailand or the Philippines. Courtesy the international bush telegraph, the news of the HIV epidemic in the two countries has spread like wild fire. A dramatic fall in tourism earnings is now being projected for both countries. The international cartels cannot be blamed if they too move out fast from the contaminated beaches and resorts. In this instance, they propose to follow the precept of a different principle borrowed from the accountancy books: *Lifo*, last-in-first-out.

At the same time, transnational cartels cannot quite forsake their global responsibilities. Tourists from Europe and America and Japan are prepared to pay through their nose so as to be able to enjoy their quota of safe fun. Maybe the Philippino and Thai girls are testing HIV-positive to such an alarming extent that they have to be crossed out, but since the demand is still very much there, it should be allowed to create its own supply; international market-lovers too must not abdi-

cate the opportunity to preside over this satisfying act of creation.

But it is still not as easy a proposition as you might initially be led to believe. The three Indo-China states, presided over by regimented and extra-puritan communist parties, are to be excluded. China is out of the question for obvious reasons, and so too is North Korea. South Korea had possibilities, but rapid economic growth has proved a deterrent; unlike Chiangmai and Mindanao lasses, South Korean girls cannot be bought at starvation wages any more. Lurid stories have of course been carried in that London rag, *Asian Babes*, about the doings of expatriate South Asian girls. Such Islamic countries as Malaysia, Indonesia, Bangladesh and Pakistan nonetheless remain intensely conservative, some of them have also of late been afflicted by a touch of fundamentalism; so better forget about them too. Singapore, anaesthetised by the authoritarian People's Action Party, would belong to the same category. And Burma, or Myanmar, continues to be a closed, dark territory.

So what is to be done? International cartels may occasionally find themselves in a state of near-despair, but they do not easily give up. Through a process of elimination, they have reached a final list of countries they intend to target: Sri Lanka, Nepal and India. The list is currently being worked over. Sri Lanka has several other charms; unfortunately, she has a low security rating. Till as long as the Sinhala-Tamil imbroglio is not satisfactorily resolved, she too will remain a question mark. Nepal has a couple of cosy side attractions such as plenty of marijuana and her association in the mind's eye with the legendary Shangrila. But she happens to be a land-locked country, and communication with the rest of the world is not always without hiccups. No such reservations need be entertained with respect to India though. She is served excellently by international air connections, she has several first rate ports; she has a huge population, and can ensure an infinitely elastic supply of young girls, which prospect will also be helped by the fact that the country is characterised by large-scale hunger and economic deprivation. Such conditions weaken the psychological resistance to participation in the entertainment trade.

There are two additional objective circumstances facilitating the choice of India as the next main base for the footloose sex-tourism industry. The drastic economic reforms introduced some two years ago have not helped India to raise her export earnings, but her imports have bulged; the balance of trade looks more and more precarious with every day. What makes the conditions worse, invisible

earnings, mostly via remittances from migrants in West Asia, have also levelled off. India is therefore in dire need of extra earnings of foreign exchange. If neither merchandise trade nor remittances are to be of much help, the most promising alternative source of foreign exchange earnings is the tourism industry. The government of the country means business in this area, it is already committed to treat the problems confronting tourist trade on a war footing. Given the predicament the country is in, it should not be too difficult to persuade those who matter that inhibitions about massage parlours and such like deserve to be discarded like worn-out apparel, if tourists like our women, why, we should feel proud, tourists are our honoured guests, if we have to supply, for the edification of visiting tourists, pubescent damsels from our households, there is nothing derogatory or humiliating about it. After all, this is very much in consonance with India's cultural heritage, the country has had, from times immemorial, the tradition of *devadasis* being offered to the resident-gods in the temples, tourists, who bring in the bounty of foreign exchange, are gods in a new incarnation. Konark-Khajuraho—and the *Kamasutra*—have already clarified notions about what activity was regarded by the gods as their favourite pastime. One should follow the gods.

Every little bit helps. The recent globalisation of our television channels has liberalised the frontiers of the mind, the average Indian householder is learning to shed his hang ups about open display of undraped female bodies. As a result, prime bodies are an increasingly acceptable concept in the Indian milieu. If the daughters from our households can make a commercial proposition of their prime bodies, conscientious objectors are unlikely to stand in the way for very long. The services of Bombay's celluloid personalities and Doordarshan mcs could be commandeered, they might use their charm to convince parents holding out till now that it is the holiest of patriotic missions for their daughters to earn foreign exchange, in whatever manner, for the country's sake, appropriate quotations from Swami Vivekananda and Mahatma Gandhi and Jawaharlal Nehru and Indira Gandhi could be thrown in in good measure in support of the cause. In the past decades, the slogan has been 'export or perish', the alternative slogan for Indian girls, in the forthcoming decade, could be 'sell your bodies or perish'. Or perhaps the government may decide to organise a nationwide competition for choosing the best slogan which could help popularise the up and coming service industry amongst the female population of this country.

The fact that the veneer of spiritualism notwithstanding, we too are basically a materialist nation will strengthen the cause. During the Second World War, stories were rampant about how a contractor, so as to swing a juicy order from an army major, would not mind throwing in the services of his wife for a couple of nights in the list of allurements offered, the wife was understanding enough to go along, it was, she would convince herself, part of the package deal whereby Goddess Lakshmi would shower blessings upon them. That is how to do the trick somehow involve gods and goddesses in the formula.

Should the sex tourism industry kindly choose India as its next base, no hitch would arise from the supply side. A residual problem though remains, and that is on the demand side. The demolition job at Ayodhya and the blasts in Bombay could scare off tourists in search of fun, as they have scared off potential investors. But, as the government is fond of saying, it is a temporary situation, once it is satisfactorily proven—that is, proven to our satisfaction—that these nefarious doings, beginning with the initial act of pulling down of the mosque, were engineered by the authorities of a neighbour-

ing country green with envy at the prospect of India's invisible earnings from tourism industry taking off, the clouds of doubt afflicting foreign tourists about to partake the charms of our daughters are bound to be dispelled.

Besides, since in the long run we are all dead, why bother over the thought that ten or fifteen years hence, India would be felled by an AIDS invasion the virulence of which is best left to the imagination? The nexus between sex tourism and HIV infection is a lagged, exponential relationship, inviting the construction of an elegant dynamic model, the higher the earnings from the service industry, the more severe and widespread would be the AIDS menace, with accompanying criss-cross linkages. If there were a Richter like scale to measure the intensity of the epidemic the virus would cause, it would be in the proximity of 8 or 9. That indeed would be the apotheosis of the free market dream.

Should you think the above narration is an unlikely, hypothetical conjecture, obviously you have no clue of the speed at which globalisation is capable of proceeding. It is a question of discarding the bullock-cart time-scale, and, along with it, the bullock-cart mind set.

Understanding Communal Riots in Maharashtra

Gopal Guru

The communal tensions which erupted in Maharashtra following the destruction of the Babri Masjid were characterised by concerted attempts by the Sangh Parivar to draw the dalits into its fold. Events show that the Hindutva forces did not succeed in this task.

THE outbreak of communal riots in Maharashtra following the demolition of Babri Masjid on December 6 stands out for three important reasons. First, after the demolition of the Masjid there was a rising tide of Muslim protest all over the state of course with varying degree of intensity and magnitude; second, it saw the cross-sectional communalisation of the masses to the extent that some began to see in this communalisation the menace of 'Saffron Fascism', and finally, the recent developments in the state also saw the liberal and progressive forces either confused or crestfallen during the first phase of the riots. Three sets of questions arise. First, what were the factors that led the Muslims to protest? Who participated in the protest? What was the social background of the Muslim protesters? Where was the protest registered and in what form? Second, in view of the claim made by the Hindu communal forces that all cross-sections, particularly the dalits of Maharashtra joined them against the Muslims for furthering the Hindu cause it is necessary to examine as to why these Hindutvawadi forces are trying to create an anti-Muslim image of the dalits? How are they doing this? To what extent have these Hindu communal forces succeeded in their plan to fan hostilities between the dalits and the Muslims? In the third set of question an attempt needs to be made to highlight as to how the different social forces respond to the recent communal situation in Maharashtra? What implications this communal situation had on the reorganisation and realignment of forces? These are certain issues that are looked into in the following sections of this report (*The Times of India (TOI)*, December 18, 1992).

Immediately after the demolition of the Babri Masjid it was to be natural that the Muslims would protest. It reflected anger against the central government's studied silence or ambivalence or its inaction to protect the Masjid from the kar sevaks. This already injured feeling of Muslims

is reported to have been further aggravated by the Allahabad High Court's decision which allowed the 'darshan' of the counterfeit idol at Ayodhya. The Muslims seem to have taken this permission for darshan as an act legitimising the vandalism of December 6.

The Muslim protest whether in Bombay or elsewhere in Maharashtra found expression prominently among groups like the hawkers, vendors, petty shopkeepers and even the construction labour at some places such as Balapur in Akola district in Vidarbha. However, the elite section of Muslim society were disturbed by the demolition and expressed their anger privately against the forces involved in the demolition. Interestingly this protest was a very categorical and militant anti-state expression among the Muslim women at some places in the state. Muslim women joined in the protest against the state's inability to prevent the kar sevaks from knocking down the mosque in the streets of Kamthee in Nagpur. These women who had come out in the streets even during the curfew period were reported to have refused to go inside their houses and instead told the police that they are prepared to take on any situation.

Similarly, Muslim women from the Magarmach colony (a Muslim-dominated area) in Sangli were found protesting against the police as a result of which some of them were arrested and later released. This reaction of Muslim women against the demolition of the mosque, however, seems to have been compounded by the atrocities that the police are said to have committed on these Muslim women during the Hindu-Muslim riots in Sangli a few months before December. For a similar reason (as reported by Engineer, *EPW*, January 16-23) in Mukund Nagar, Bombay when some Muslim women went to the police station to register their complaints against the discriminatory police behaviour the police opened fire on them injuring one woman seriously. Moreover, some Shiv Senaites attacked these women

in the presence of the police.

Muslim women were also seen taking courageous stand against those rioters who tried to confiscate household belongings that had been so laboriously accumulated by these women. However, this was not an universal experience. On the other hand, the involvement of women belonging to some of the front line Hindu communal organisations was aimed at provoking the Hindu men by presenting them with 'bangles'. At places, particularly in Bombay Hindu women are said to have prompted some police officers to attack the Muslims.

There are several other factors which have a bearing on the Muslim protest in Maharashtra. The protest was largely spontaneous in the sense that it was not directed or influenced by any Muslim communal forces in the state. However, at some places where the Muslims had kept a low profile during the first phase, they were constantly provoked by both the Hindu communal forces and the police. For example, at Maulali Chowk in Solapur a Hindu doctor was reported to have burst crackers after the demolition. This act of the doctor led the Muslims of the area to assert their identity in the street which led to the police firing injuring two people. Similar acts of provocation by the Hindu communalists were evident at Udgir, Basmat, Parli, Beed, Hingoli and Nanded in Marathwada and Akola in Vidarbha. However, at some places like Kolhapur, despite the provocation crackers were burst in the famous Mahalaxmi temple—Muslims maintained a remarkable calm. This was aided by the active and timely intervention of both the Muslim and non-Muslim left and progressive forces from the town.

There are several other important factors that have led to the Muslim reaction.¹ These include, large-scale migration to Bombay, mushrooming of slums, rampant land-grabbing and the wretched life of the slums. Though this reasoning is largely true of Bombay it does not explain communal silence visible at Bhiwandi, Malegaon, Aurangabad and Miraj. Nor the communal tensions that occurred at taluka places particularly in Vidarbha and Marathwada of the rural Maharashtra. As mentioned earlier, during the first phase of the post-Ayodhya developments the taluka places and in some cases big villages were affected by the communal trouble. Thus, in Marathwada the communal tensions broke out in Udgir, Osmanabad district, Basmat, Hingoli, Jintur, Nanded (district headquarters) Kandhar, Parli and Beed (district place). In Vidarbha, the problem erupted at Pim-

palgaon raja (taluka Mehakar), Khamgaon, Tunki Bawanbir (Jalgaon Jamod in Buladhana district), at Akot, Balapur, Patur, Karanja (taluka Murtizapur), Barsi Takli and Akola in Akola. Tensions also erupted at Amravati and Nagpur and Pandharkawada in Yeotmal district of Vidarbha.

While communally-prone places such as Malegaon, Bhiwandi and Aurangabad and Miraj were silent due to adequate precaution by the police and more importantly due to the horrifying memories of past riots which still grip the minds of both the communities. But tensions of various kinds like between the Muslim and the state on the one hand and between the Hindus and the Muslim on the other occurred at the taluka places with no history of communalism. This new phenomenon certainly warrants an explanation.

Thus, there could be following factors responsible for this kind of taluka pattern of communal tension. First, these taluka places with a significant percentage of Muslims in the population provided them with some kind of economic security and social power. This was facilitated by the patronage structures that was available during the Muslim rule in Marathwada (for a long period) and Vidarbha (for a brief period), by the petty shop keeping and artisan activities which could flourish at taluka level more easily, and by the fact that Muslims with non-agricultural background had to pursue these activities at taluka place only. In addition Muslim dependence on taluka places particularly in Marathwada region was enhanced by the Muslim migration from the villages to the taluka places during the police action in 1948. Nonetheless, all these above factors led to a Muslim concentration in the taluka places. This significant size of the population together with the economic independence provided Muslims with some sense of security which in turn enabled them to acquire some space for asserting the identity in crisis situation.

Second, taluka places represent the last link in the chain of governmental authority with even the structures of formal political power are located here. Formal political life too is more active and can be articulated in effective ways at the taluka level. Thus, this entire politico-bureaucratic landscape of the taluka provides opportunity for these groups to have their voices heard and protest registered. This is aided again by the impersonal social situation prevailing in the taluka and not in the villages. It is precisely for these reasons the Muslims chose only taluka places to convey their displeasure to the government authorities, to political forces from both within and outside and also the Hindu communal forces. But they did not realise that they were going to acquire this space in the streets at the cost of risking

both their lives largely at the hands of the police and of the Hindu communalists and having their property looted by the rioters of all social variety. Like Bombay, here at these places also, out of the total killed in the police firing, 95 per cent were Muslims. Properties of Muslims ranging from the petty pan shop at Basmat in Parbhani to a palatial showroom with costly electrical and luxury goods at Akola were either looted or destroyed. However, a big Hindu jewellery shop at Akola was also not spared by the rioters.

Third, it is the taluka places which again provide a sort of canopy for illicit transition in liquor, black marketing in articles like kerosene, forest wood, gambling of various kinds, and illegal operation of video parlour. This kind of doubtful transaction can cause tension emanating from the violation of terms of trade either between protector of law and the breakers of law on the one hand and between the dominant partner ('matka king') and the junior partner in the dubious games. Thus, tensions of the underworld can contribute to the aggravation of communal problems. This was true of the taluka place like Gangakhed in Parbhani district where the junior partners in the gambling game attacked the dominant partner who was a Muslim. While at Patur in Akola district during the recent communal riots tension prevailed between the Muslim kerosene dealers and the police but it did not take any serious turn.

In addition to these three general factors which give a general idea about the taluka pattern of the communal tensions in Maharashtra, there are three more rather isolated but important factors which make the taluka pattern much more disturbing. First, as was reported in the local newspapers and also shared by social activists, in Maharashtra, particularly Marathwada, it was young people from different caste and religious groups who were found participating in the communal riots. These young people roughly between 18-20 age group, by and large, belonged to a lumpen variety which again is the product of the lack of job opportunities either in the form of agro-industrial development or any adequate and sustainable growth of small-scale industries at the taluka level.

However, in Marathwada again it was not only this lumpen element that was involved in the riots. In some places like Parli and Udgir, college students were involved in attacking the Muslim property. In fact at Udgir, it is said that it was the students of a non-grant local engineering college who provoked the students from a neighbouring Arts college to participate in the riots against the Muslims. The question that needs to be raised here, why did the local students take part in the riots? Is their communalisation related to the

frustration which is again related to their marginalisation from these engineering colleges which are run by the local politicians who charge quite exorbitant capitation fees which the local students are not able to pay? Finally, at Beed and Parbhani district, of Marathwada, it is argued that trouble-makers were brought by the Shiv Sena to the taluka places in order to assist the local people in terrorising the Muslims.

Up-till now we have seen that communal riots outside Bombay, by and large, occurred at the taluka places and some of the district places in Marathwada as well as in Vidarbha. Though the villages in Maharashtra remained generally peaceful, in some villages, communal tensions prevailed. For example, in the village called Digrass Mauje in Sangli district of southern Maharashtra, a Muslim darga was damaged by Hindu communalists immediately after December 6. This particular darga was a symbol of the composite culture as it was built by Hindus and the Muslims together some 20 years ago. However, it seems that the demolition of the Babri mosque provided a spark to the tension that was evident in the village. The nature of the tension between the Hindus and the Muslims was political in the sense that out of all the Muslim families in the entire village, the rich Muslim family had sided with one of the non-Muslim panels in the local election which had taken place a few days before the demolition. It seems that the defeated panel engineered the damage to the darga by hiring hooligans from Sangli. However, this particular darga has now ceased to be the symbol of the composite culture that prevailed in Mauje Digrass till the demolition of Idga. Yet at another village also called Kasbe Digrass the Hindus are reported to have not only used provocative language against the Muslims but they also put up a saffron flag on top of the Idga after the Ayodhya demolition.

However, in the Vidarbha region particularly villages in Akot taluka in Akola district the Hindu-Muslim tension of December 6 looks to be the continuation of Hindu-Muslim tension which began in 1986 and 1988. The tension was evident in Pathardi, Lohari and in Akola and Karajgaon in Amravati district. In Karajgaon two Muslim boys were reported to have been killed by caste Hindus. During the recent riots in the state, tension prevailed in Marathwada villages like Pathrud in Majalgaon and Saigaon in Ambejogai in Beed district. But both these villages were tense for reasons other than those found in Vidarbha and southern Maharashtra. It was said that in both these villages the Muslims who were numerically significant tried to protest against the demolition of the mosque at Ayodhya.

Barring these few exceptions, villages in Marathwada were peaceful. It is due to this that there was no reference to the 'razakar phenomenon' which could otherwise have led the Hindus to whip up in an indiscriminate fashion communal passion against the village Muslims and the dalits who were massacred by the caste Hindus during the Marathwada University renaming agitation in 1978 on the ground that the dalits aided the razakars against the Hindus in 1948 in Marathwada.

WINNING DALIT SUPPORT

This time, these Hindu communalists surprisingly enough were found making confident claim about the communal friendship with the dalits against the Muslims in Maharashtra during the first phase of the recent troubles. Therefore, in view of this Hindu communalist claim, it is essential to raise the question as to why these Hindu communalist forces are trying to win over the dalits against the Muslims. In other words, why are these forces creating enemy image (anti-Muslim) among the dalits of Maharashtra?

Being a political party and an important member of the Sangh Parivar, the BJP's main objective is to weld the Hindus into a political community. This unity is sought by the BJP for fulfilling its ambition of capturing political power in Delhi. Dalits, if mobilised as one political group and in any electoral combination can form a critically important element in the electoral politics of Maharashtra. The Congress in Maharashtra used this dalit factor together with the Muslims successfully from 1967 to 1984. But after 1984 in certain areas like the Akola parliamentary constituency the dalit-Muslim electoral combination came into being and sustained itself through 1989 and 1991 parliamentary elections. This combination posed a serious challenge to both the Congress and the BJP. This was evident in the 1984 by-election of Akola parliamentary seat where the BJP voters at the last moment were asked by their party bosses to save the Congress candidate against a dalit candidate supported by dalits and the Muslims who according to a rough estimate constitute about 35 per cent of the total electorate in the constituency. It is interesting to note that dalit Muslims also constitute about 30 per cent of the total population of Vidarbha (*The Times of India*, January 30).

The BJP believes that this above process can be facilitated among the dalits of Maharashtra at least for three reasons. First, Hindu consciousness is still present in varying degrees among certain sub-castes of the dalit community in Maharashtra. Second, there is a criminal lack of intervention on the part of both the left and the dalit forces which could otherwise engage the dalit energies in a project for

ensuring human space for all the marginalised sections of all social origins. Finally, the continuous withdrawal of the Indian state from the social spheres and the growing privatisation of the Indian economy might result in dalit frustration which in effect might goad the dalits towards communal forces. But this would not make the task of Hindu communalist absolutely easy for winning over the dalits. The BJP is shrewd enough to realise this. Therefore, for weaning away dalits from the Congress, the BJP and the Sangh Parivar are using the same Congress strategy of co-opting dalits into its opportunity and patronage structures. But for making dalits available for communal purposes the BJP and the entire Sangh Parivar seems to be using a three-prong strategy.

At one level, the Sangh Parivar, as a primary condition of communalisation, is Hinduising the dalits of Maharashtra by either extrapolating the writings of Ambedkar or by raising the bogey of so-called social reform for the dalits (*EPW*, February 16, 1991). At the second level the Sangh Parivar is attempting to create an anti-Muslim feeling among the dalits by once again (mis)using Ambedkar's literature. Finally, it has also used Gobelin tactics for fanning tensions between the dalits and the Muslims in the recent communal troubles.

Of late, there has been a constant attempt on the part of the Hindutva forces to project Ambedkar as anti-Muslim.² Was Ambedkar really anti-Muslim and therefore, pro-Hindu as the Hindutvawadi intellectuals seem to be suggesting?³ It is clear from Ambedkar's writings and speeches that he criticised Muslims at two levels. At the ideological level, Ambedkar criticised certain Islamic practices which did not accord equal status to the lower sections and women from the Muslim community.⁴ At the practical level, Ambedkar was also critical of those elite Muslims who were subjugating the dalits to the feudal exploitation of the former.⁵ However, it needs to be recognised that Ambedkar also acknowledged the help given by certain elite Muslims who provided social space and also the actual resources in launching the dalit movement in Maharashtra.⁶ Thus, Ambedkar does not condemn Islam as such.

Even with regard to the communal riots in Bombay or Solapur in the late 1920s, Ambedkar seems to have taken a consistently objective position. For example, during the Hindu-Muslim tension at Solapur in 1928 when the caste Hindus were pressurising the dalits to take the side of the former, Ambedkar advised the dalits not to make common cause with the Hindus against the Muslims.⁷ In this connection it is interesting to note that the Solapur Municipal Council was not only annoyed with Ambedkar but it was

reported to have passed a resolution condemning Ambedkar.⁸ Yet at another place Ambedkar did not hesitate to hold Hindu responsible for spreading anti-Muslim rumours during communal riots.⁹ But this is conveniently forgotten by those Hindutvawadi intellectuals who are quoting Ambedkar from the same source.¹⁰ Finally, Ambedkar without any discrimination considered three categories, religious priests, religious fanatics and the educated from both the religions, responsible for creating communal tensions for personal interests.¹¹

Hindutvawadi intellectuals further argue that Ambedkar considered Muslims as a separate nation as they practised a separate religion.¹² While it is true that Ambedkar in a rather reluctant mood talked of separate nations for the Muslims, it never was his final position. In fact at the end of his major book on Muslims *Thoughts on Pakistan* he talks of a joint front of the lower orders of all religions.¹³ Moreover, Ambedkar true to his radically liberal theoretical stature, could never have viewed the problem of nationalism as one emanating from religion as argued by the Hindu communalists. In fact, he saw the seeds of nationalism as a means of modernising a particular society.¹⁴ For the sake of argument and also for comforting the Hindu communalists let us suppose that Ambedkar advocated separate nation for the Muslims, does that mean he was for Hindu Rashtra? Ambedkar categorically says, "If Hindu Raj does become a reality, it will no doubt be the greatest calamity for this country".¹⁵

To what extent the Hindu communal forces were able to use Ambedkar for mobilising the dalits against the Muslims in the recent riots in Maharashtra? The inability of the Hindutvawadi forces to win over these Ambedkarwadi dalits in Maharashtra is highlighted by the press reports (*TOI*, January 31). Then what kind of strategy have these Hindu communalists used to pitch dalits against the Muslims during the first phase of the recent riots? In Maharashtra, dalit response to the communal situation from historical time has been of two kinds. One response is out of conviction and the other is out of compulsion. As we shall see in the following section, both the kinds of responses were historically present among the dalits of Maharashtra. In Maharashtra, like chambhars, dhors and mangs, some mahar families particularly from Vidarbha region have been strong proponents of Hindutva. On the questions of protecting Hindutva, these families even crossed swords with Ambedkar. Some mahar families despite their inclination to and efforts towards reform among the dalits nevertheless had a trait of communalism. This was evident in their mobilisation in

which such families projected the Muslims as cruel and the enemy of Hindu religion because they slaughtered the sacred cow." But after the Buddhist conversion led by Ambedkar in 1956 at Nagpur large numbers of dalits particularly from the mahar caste turned away from the practices of Hinduism while the mangs and chambhars were not so attracted towards Buddhism. However a section of the mahars continue to support the Hindutva forces.¹ Some dalits had gone to Ayodhya and on their return reportedly took anti-Muslim posture during the riots. But the number of such dalits was negligible and the involvement insignificant. Therefore, in the recent riots, the Hindu communal forces seem to have used other methods to enlist the support of dalits. For example, in Aurangabad district of Marathwada the Hindutvawadi forces were found spreading rumours about the large scale involvement of dalits in the Ayodhya vandalism. But contrary to such a claim, a field survey of 22 villages in the same district, conducted by Yuvak Kranti Dal immediately after December 6 reveals that only one dalit in all these villages had undertaken the journey to Ayodhya but came back from Manmad realising that he had boarded the wrong train.

Second, Hindutva forces did not give up their attempt of pitching dalits against the Muslims. They chose Nagpur for creating trouble between the dalits and the Muslims. They tried to capitalise on incidents in which the statue of Ambedkar was disfigured and demolished at three places in Nagpur. But the dalits were not provoked. Finally the Hindutva forces are said to have made another vain attempt to create tensions between the dalits and the Muslims in Maharashtra. Hindu communal forces tried to provoke dalits against the Muslims capitalising on the personal fights between the Muslims and the dalits at Nehru Nagar, Gowandi and Dharavi in Bombay and Jaibhim Nagar at Aurangabad. But this did not succeed.

However dalits did participate in the riots. The following reasons may have been responsible for the dalit involvement. First, the so called dalit involvement in the communal riots even in the past was more for achieving transient (mundane) interests rather than protecting 'transcendental' (larger ideological) interests. For example, in 1893 communal riots in Bombay the involvement of mahars and some of the Telugu dalits was influenced by the consideration of loot and not by the cow slaughter issue which could not have provoked them against the Muslims for the simple reason that the former were beef eaters.² Even in the recent riots the dalits joined the rioters of all social variety not for expressing their Ram Bhakti but for loot. The pure lumpenised intention was evident when at places like Akola indiscriminate looting

of the Hindu and Muslim shops by the dalits was alleged.

Second, in the first phase of riots particularly in Bombay, the electoral prospects seem to have compelled dalit politicians particularly at the local level, to take an anti-Muslim stance in a predominantly Hindu constituency. This was evident in Dharavi area, where a dalit municipal corporator was seen taking an openly anti-Muslim posture. Third, in the recent riots, the sense of social insecurity among the new class of dalits of Bandra in Bombay have led the former to join the 'mahaartis' and meeting convened by the Hindu communalist.

In fact, quite contrary to the expectations of the Hindu communal forces at number of places dalits helped Muslims either directly or indirectly. For example, it was reported that at Matunga labour camp, Ghatkopar, Vikroli, Bhandup and Kuria slums, dalits held meetings and warned Hindu communal forces to refrain from creating trouble in these areas. Some dalits are said to have influenced right-minded police and military to maintain

law and order which practically meant helping the Muslims. At some places like Bhandup and Chembur dalit families gave shelter to the Muslim families, while at Tulsiwadi area, a dalit woman corporator, late Shanti Baria, laid down her life for communal harmony, a fact acknowledged by Muslim women who demanded 'jannat' (heaven) for Shanti Baria.

Similar reports of direct help to the Muslims have come from Latur district in Marathwada where the dalits are said to have created a physical fence around the Muslim families. This protection by dalits was possible may be because both the communities have numerical dominance in the town. At Akola, dalits of Bhimnagar were also reported to have threatened the Shiv Sena chief Gulabharao Gawande of dire consequences if the Shiv Sena tried to create trouble in Muslim areas like Rameshpura and Gulzaripura situated in close vicinity of Bhimnagar. In some of the villages in Akot taluka of Akola district, dalits were courageous enough to box the ears of some Shiv Sainiks who attempted to attack the Muslims engaged in selling beef in the villages.

While there was growing communalisation of police all over Maharashtra police personnel particularly from the dalit communities were either impartial or were protecting the riot-affected Muslims in the state. This was evident in Bombay, Bheer, Jalana and Latur districts. This impartiality was acknowledged by a senior Muslim police officer from Bombay, who in his interview with the press (*The Times of India*, January 26) went on record observing that now he was inclined to support the reservation policy which produced impartial personnel in the police force. However, at places, dalit police personnel had to face the wrath of Hindu communal forces who did not like a dalit police giving protection to poor Muslims. For example, a dalit police constable (from a matang community) posted at Udgir was assaulted by the Hindu communalists where he tried to rescue an aged Muslim. At this juncture, it has to be kept in mind that dalits supported Muslims not because they are the natural friends as some forces would have us believe but because of two reasons: One, just out of human concern and secondly, due to the practical need. For example for ensuring regular supply of beef in the villages where dalits can afford only beef. Similarly, in the urban settings where dalits, Muslims as also other Hindus are locked together in wretched slums and are marginalised despite the occasional personal tensions, they have to maintain a minimum solidarity against the threat of eviction and displacement by the interested forces and local authorities. The establishment of Rahiwashi Sanghs in Bombay slums reflects this necessity. However, the dalit leaders from the different political factions, by and large, remained either totally silent or could offer only half-hearted condemnation of the demolition of mosque. Some chose to remain conveniently ambivalent over the issue. These leaders condemned the riots but not the forces subverting the constitution.

Those dalit leaders who participated in the protest against the demolition of mosque, however, appeared to be half-hearted because their participation was a token gesture in the joint venture organised by the secular forces. Both tactically and politically dalit protest should have been like the one which could resemble the mammoth strength demonstrated by dalits against Hindu communalists on the 'Riddles' issue some years ago in Bombay. In fact, dalits of Maharashtra had two solid issues on which Hindu communal forces could be checkmated. One was to enter as third party in the Ayodhya issue and stake a claim to the Buddha Vihar at Ayodhya. And the second was to challenge effectively the controversial control of the Buddha Vihar by the Hindu priests at Gaya. But neither issue was adequately exploited by dalit politicians. Thus, they lost

the historical opportunity of intervening in the situation.

Even dalit literary figures particularly from Bombay did not show enough courage to protest against the destruction of an Irani hotel which had provided both space and time for these writers to chalk out their emancipatory programmes and strategies in the past. However, the doyen of dalit literature Baburao Bagul was forthright in his condemnation of the Hindutva vandalism as was evident in his presidential remarks at the second state-level workers' literary conference which was held at Nagpur in the first week of January, where the danger of communalism was also sounded by working class literary figures through many forms. The mainstream Marathi literary meet held at Satara during the same time, however, maintained a studied silence over the demolition issue. The argument advanced by prominent Marathi literary figures was that they did not want to mix literature with politics, but the same so-called neutral literary persons did not fail to elect to the Satara meet a person whose Hindutva inclination was an open secret. In this connection it is interesting to note that the chief of the Shiv Sena enjoys a large following among the Bombay's literary circles (*TOI*, January 23). However the solitary protest efforts of the noted literary figures like Laxman Mane, Pramod Koparde, Hari Narke, Kishor Belkhal and above all Vrinda Karandikar who criticised the insensitivity of the meet on the issue of communal harmony and peace, must be noted.

The Congress response to communal situation was of a mix in the sense that while the state level Congress leadership was at least verbally condemning the BJP, VHP, RSS, Shiv Sena, Bajrang Dal combine for creating a communal frenzy its local level leadership seems to have responded to communal situation in three major ways: One followed the prime minister's argument that the BJP did not keep its promise of offering symbolic kar seva at Ayodhya. The second kind of response from the local congress leaders was utterly callous as it reflected the absence of these Congress leaders from their respective constituencies which were exploding with communal tensions. The third category was found to be more vocal in taking pro-Hindutva position at the local level. This was evident in the Kolhapur zilla parishad where the anti-Muslim feeling among the Congress members was so strong, that these members did not hesitate to hold the Congress responsible for the Muslim appeasement which according to them resulted in the demolition of the mosque (*Maharashtra Times*, January 17); the situation in Bombay was not so different. As reports show, there was a growing fascination in the Congress

rank and file for the Hindutva blitzkrieg. A sizeable section of the Congress is believed to have actively assisted the local BJP/Sena workers in managing the mahatras in Bombay. Some Congress leaders who also happen to be the sugar kings in southern Maharashtra could not have been scared by BJP or Sena as they have strong grip over the voters and kept a surprising silence over the demolition by Hindutva forces.

However, Nagnath Naikwadi, true to his secular progressive credentials, mobilised the workers and peasants of Hutatma Kisan Ahir sugar factory, and took out a morcha of more than 10,000 in a small town called Walva in Sangli district. Similarly, in Kolhapur a prominent CPI leader, Govind Pansare, in an intelligent move, solicited the support of local Congress leaders whose very presence in a progressive joint front called 'We Indians' deterred the belligerent Hindu communalists who were out to attack Muslims.

Hindutva's Low-Intensity War against Bombay's Riot Victims

Gurbir Singh

The communal war is far from over in Bombay. Hindutva forces are determined to continue to target the Muslim community and keep the fires burning. Various arms of the state—Bombay Municipal Corporation, the police, the forest department—have established a close nexus with the Shiv Sena and other communal forces to keep up low-intensity attacks on the riot victims.

IN a swift, brutal action on February 18, ten rebuilt tenements of January 1993 riot victims of Jogeshwari's Sitawadi were demolished by officers of the 'K' East Ward of the Bombay Municipal Corporation. This act summarised the severe trial of riot victims all over Bombay faced in their bid to return to normal life. It also showed the widespread network Hindutva forces had developed to keep up a low intensity attack on the minority community.

Jogeshwari (East), off the Western Express Highway, is a major Muslim enclave in Bombay and was the centre of widespread riots and police firings in December 1992 and January this year. The Muslim community, thickly bunched, is concentrated in an elevated area, which is surrounded by Hindu Maharashtrian localities. At the centre of the Muslim enclave is an area called Bandra Plot. It was here that the now famous Radhabai Chawl (actually called Gandhi Chawl) was set afire on the January 6-7 night, probably by some Muslim criminal elements, in which eight members of the Bane family perished. Using this outrage as an excuse, Shiv Sena and other Hindutva fanatics, began the blood bath which engulfed Bombay for the next 10 days.

In Jogeshwari itself, the January riots took a heavy toll. More than 20 people were killed—mostly Muslims—and Muslim houses on the periphery of the enclave were burnt, looted and destroyed. Some Hindu houses on the borders, Meghawadi and Sitawadi particularly, were also destroyed. The day after the Radhabai Chawl incident took place, a joint Shiv Sena-police posse entered the Bandra Plot area and evacuated over 200 Maharashtrian families to a nearby Municipal School, while the BMC sealed the evacuated tenements. Significantly, this was the largest contingent of Hindu refugees which the riot produced, and was the basis of much Shiv Sena politicking, as we will see later.

The Nivara Hakk Suraksha Samiti (NHSS) began riot-relief work in the area from January 14 onwards. Besides reaching immediate necessities to the riot victims, the activists observed that virtually the

entire Muslim enclave's population, who had not yet fled to their villages, were 'riot hit' in the sense that severe curfew restrictions and fear of attacks from police and Hindu lumpens had placed them in a virtual state of siege. With ration shops shut, and shopkeepers having fled, supply of fair-price rations became an essential activity.

It was during this period that Nivara activists discovered that the Muslim enclave was also made up of nearly 1,500 Hindu families, or 20 per cent of the population, both Maharashtrians and non-Maharashtrians, most of whom had preferred to remain behind. (In the December riots, however, a few Hindu shops and a police choky in Bandra Plot were burnt.) Investigations also revealed that while sharp clashes between the two communities took place on the borders, there were no mob attacks on Hindu families or property within the Muslim areas. Even in the Radhabai Chawl incident, there was no mob attack. It was a sneaky night raid by obvious criminals, and the police are yet to come out with a coherent picture of the incident. In fact, neighbouring Muslims helped douse the flames on that fateful night.

'REFUGEE POLITICS'

This background becomes essential if the Shiv Sena's 'refugee politics' is to be understood. Soon after the 200-odd Maharashtrian Hindu families were 'rescued' by the Shiv Sena activists, led by two corporators—Ravindra Waker and Rajeshwar Raginwar—a demand was made to the state government by the Shiv Sena that the Hindu families 'be given accommodation elsewhere in pucca tenements. In the meanwhile, as tensions between the two sides subsided, the odd sight of the Hindu families coming to their houses to clean up and carry out other chores during the day and returning to the Municipal School refugee camp during the night was observed. With appetites whetted for Maharashtra Housing Board flats, appeals that all was safe and that they should return home fell on deaf ears.

It was around mid-February, a month after the riots, that NHSS and other social organisations like YUVA announced programmes for rebuilding houses destroyed during the riots. The state government and the Bombay Municipal Corporation came out with a liberal programme for rehabilitation, whereby reconstruction of riot-destroyed houses were to be given priority, and documentary evidence and other red tape was to be dispensed with. Nivara was the first to begin, and a list of 20 such houses to be reconstructed in Jogeshwari was given to Collector (Suburban), Suresh Salvi, who gave the go-ahead, and promised to intimate the BMC. Being state government land, Jogeshwari fell under his jurisdiction.

The reconstruction work began on February 15, one of the areas where NHSS concentrated was Sitawadi, Banej on the highway as well as on the Hindu-Muslim 'border', the rioting Hindu mobs had razed nearly 15 tenements in this area to the ground. For the same reason, when reconstruction work started, it caught the eye of the authorities. For three days, a variety of officials, highway engineers, BMC officers and Collector's men, tape in hand, measured and examined what was going on. They seemed satisfied that the original plinth area had been maintained as required. However, on February 18, without any notice (a 'stop work' notice under Section 354-A of the BMC Act is essential), a BMC demolition squad from 'K' East Ward came and razed three days of construction to the ground. Nearly a lakh of rupees worth of donations from sensitive citizens and the Times Relief Fund was literally washed into the Jogeshwari nullah. Residents who protested were beaten by the police. NHSS activist Seema Hirani was arrested.

The reaction was also quick and vigorous. By 3 p.m. the same day, February 18, a procession led by Nivara of over 500 persons, mostly women from Jogeshwari, shouting against BMC ward officer V B Pawar, occupied the offices of the 'K' East Ward at Andheri. After an hour-long stand off, the police moved in, beat up people and arrested about 80 of the protestors. There was a furore in the press, and senior government officials like the Collector, Suresh Salvi, and the Additional Municipal Commissioner, B M Ambhaikar, seemed genuinely outraged that riot victims' houses were demolished for the second time. Ward officer V B Pawar was hauled up and orders for his transfer were issued.

V B Pawar called a meeting with 'Nivara' on February 22 to sort out the tangle. That was when the story rolled out. Even as the meeting was proceeding in the ward office, and Pawar was giving assurances that the construction could begin, suddenly Jogeshwari corporators—led by Shiv Sena

corporators Ravi Waiker and Rajeshwar Raginwar (also present were Congress(I) corporators Baba Singh and Noor Jehan Khan)—stormed in and demanded that no permission be given to Muslim houses to be reconstructed till the matter of giving alternative flats to the 200 Hindu refugee families was settled. Nivara activists said the two issues should not be linked, and that the corporators could not sit in a meeting in which they had not been invited.

But it became obvious they *had* been invited by V B Pawar himself. And with the intention to disrupt the meeting. Ultimately Pawar not only insisted that the corporators had a right to sit in the meeting, but turned around and refused to allow the Sitawadi reconstruction to go ahead.

Meanwhile, information pieced together revealed that all the five corporators of the area, three Shiv Sena and two Congress(I) had joined hands, together with Ramesh Dubey, former minister and MLA, to register a formal complaint demanding the demolition of the reconstructed houses. Ramesh Dubey and the Sena corporator Ravindra Waiker had a particularly notorious role during the riots, and dozens of Muslims in the area had signed statements claiming having seen them personally leading the attacking mobs. In this drama, Noor Jehan Khan, Congress(I) corporator of the Bandra Plot area had at first refused to sign the demand for demolition, but finally bowed to the pressure of Dubey. Having colluded with the corporators in demolishing the houses, V B Pawar demanded that they in turn defend him. Thus the spectacle created on February 20, followed up thereafter with a letter signed by the corporators supporting V B Pawar and demanding cancellation of his transfer order.

To sort out the continuing tangle—by now the BMC had prevented other destroyed houses from being rebuilt in Jogeshwari and other areas—a high level meeting chaired by Satish Tripathi, secretary (Rehabilitation), government of Maharashtra was called on February 23, which included the various relief organisations, Shiv Sena and BMC and government officials. After much acrimonious debate, it was agreed that all riot-destroyed and damaged houses would be allowed to be reconstructed without *formal* permission, but after the BMC inspected the area to ensure that the original plinth area was maintained. Minutes of this meeting were to be circulated to all BMC wards to ensure speedy rehabilitation of the riot-hit in other areas too. With this small victory in hand the demolished tenements of Sitawadi were again constructed.

SKY FOR A ROOF

However, not very far away, at Etbhatti, Goregaon, again off the Western Express Highway, a few days later, the BMC

enacted a similar drama. On January 11 night, a Hindu mob, 'spiritually charged' after a 'maha-aarti' had set fire to the waste and cardboard godowns situated in the Etbhatti market. Though both of these are owned by Muslims, the 'basti' behind the godowns sheltered both Hindus and Muslims. And as fire does not recognise religion, it spread out and burnt the houses of both communities. 'Nivara' thus began work for the reconstruction of nearly 25 houses mostly of Hindus in this Etbhatti area from the third week of February.

The Bombay Municipal Corporation (BMC) of course was not far behind. Reportedly acting on a complaint of the Shiv Sena corporator of the area, Sudha Churi, the ward officer of 'P' South Ward, Hankare, issued a 'stop work' notice on March 1, and despatched a demolition squad on March 3. It was the high preparedness of the local basti-dwellers that saved the day. A large mob of angry residents greeted the demolition squad. With the construction sites deep in the narrow gullies of the basti, the squad thought discretion to be the better part of valour, and took to its heels rather than face the crowd.

On March 4, a stay on demolition was obtained from the City Civil Court. Meanwhile, all arguments that the government and the BMC had formulated a policy of allowing reconstruction of riot-hit houses without formal permission, as decided in the meeting covered by Satish Tripathi just did not wash with the local BMC brass. Repeated meetings with ward officer Hankare and the Deputy Municipal Commissioner S R Dange ended in nothing. Finally, to avoid a repeat of Jogeshwari, Additional Municipal Commissioner B M Ambhalkar, stepped in once again, and the houses were completed and handed over to the owners on April 3.

Through the Mahim creek, which divided Bombay island from suburban Bandra, runs huge water-pipelines. Along these pipelines, a large number of families had been staying for the last four to five years, in settlements called Rajivnagar and Indiranagar. Predominantly Muslim (65 per cent), these bastis were torched during both the December and January riots. About 70 houses were burnt and another 50 looted and destroyed. A Bandra-based legal aid group, the Majlis, took up the cause of these riot-hit and began rebuilding the huts in the last week of March.

By March 25, led by Shiv Sena leaders, a large group of Koli fishermen arrived, abused the riot victims and attempted to stop the construction work. The next day, acting on the complaints by the Shiv Sena, demolition squads of both the BMC 'H' Ward as well as Additional Collector (Encroachments) arrived to remove the huts.

They were a "danger to the water mains", and were fresh hutments and had nothing to do with the riots, the officers claimed. The activists got a reprieve for a few days as they showed the panchnamas issued by the police which indicated that the huts *had* been burnt in the riots. It was also pointed out that the reconstruction was taking place with building material issued by the state government-constituted rehabilitation committee.

But the reprieve was not for long. A week later, on April 3, the demolition squads came again and levelled the neatly constructed huts. Something is perverse about these demolition departments. They allowed the huts to come up, designed and directed by architects, allowed a nice coat of paint to be applied (and we admired the gleaming tin roofs neatly contoured along the pipeline from the Bandra flyover), allowed Rs 3 lakh worth of material to be sunk in. And then they moved in. The irony of the operation is they even confiscated the very tin sheets provided by the 'rehabilitation arm' of the state government!

The Majlis activists ran from pillar to post to undo the damage, and finally were able to secure a hearing from the chief minister, Sharad Pawar. The bureaucrats stuck to their stand that these were recent encroachments and that they were not burnt at all. However, in two meetings with Pawar on April 6 and 8, the activists, through documents and panchnamas, convinced him of the injustice done and alternative plots for these riot-hit was agreed upon.

As this goes to press, however, the collector's men are refusing to go by the survey carried by the activists, and are again demanding documentary evidence for alternative allotment. The activists say the destroyed plinths, together with the panchnamas, adequately show the number of huts. The collector's men are determined to see that the least possible number are rehabilitated. Result: the Mahim pipeline riot-hit continue to squat at their old sites in the scorching May heat with the sky as their roof.

The same were the travails of the slum-dwellers of the Mahatma Gandhinagar slum, Antop Hill, where nearly 500 tenements were damaged or destroyed by attackers between January 9 and 12. On Bombay Port Trust land, the riot victims were being helped by the Gandhi Relief Camp, and its main organiser, one Father Christopher Brien of a local church. Despite desperate attempts to get permission for the reconstruction from the 'F' North Ward office of the BMC, stonewalling continued, forcing the riot-hit to live in the relief camp months after the riots had subsided. The Port Trust had no objection to the reconstruction since the slum is an old one, and most of the residents possess documentary evidence.

Finally, fed up with the attitude of the BMC, the relief camp organisers began work on the reconstruction of the huts around April 15. They are hoping that the demolition squads do not come.

ATTACKS ON FOREST BASTIS

Then, in the wake of the BMC demolition squads, came the forest department. Stretching from Goregaon, near Film City, to Kandivli—a 10 km stretch, is an endless expanse of slumdwellings on the border of and spilling into the Sanjay Gandhi National Park. On April 22 and 23, the forest department, with police protection, demolished nearly 300 huts in Matangarh, a shanty colony close to Film City. On April 28 and 29, the squads moved on to raze Azad Nagar and a portion of Ambedkar Nagar, off Kurar Village, in Malad. As this goes to press, sporadic demolitions are continuing.

The history of these localities is significant. These shanty colonies, numbering nearly 80,000 tenements along the National Park, are occupied by a mixture of Muslims and Matang and Mahar dalits. The Muslims of Matangarh, Azad Nagar and Ambedkar Nagar became the target of Hindu communalists on January 10 and 11 nights. Nearly 300 houses were torched or destroyed and about 20 people were killed and scores injured in the area. Significantly, however, a large number of dalit houses were also destroyed and looted. Most of the Muslims fled into a Muslim enclave in Malad called Pathanwadi, where nearly 350 of these shanty families made up the bulk of the relief camp set up there.

To the Nivara Hakk Suraksha Samiti activists working among these riot victims, it became apparent that a significant aspect of the communal attacks in the area were linked to land grab bids by local gangs. Attempts to take the Pathanwadi camp families back to Matangarh and Azad Nagar were stoutly resisted by local hoodlums.

Then on February 4 night a dalit basti, Shiv Shakti Chawl in Appapada consisting of about 110 huts, was burnt to the ground. On investigation, it was revealed that it was the handiwork of one Dinesh Singh Thakur, a local upper caste slum lord, who had been trying to evict these residents for some time. Significantly, Thakur had tried to cover his tracks by getting his henchmen to smash the idols in the nearby Datta Mandir on the same night and thereby pass it off as a communal clash. It was the tremendous political maturity of the dalits of the basti, who immediately saw Thakur's game, and themselves repaired the damage to the idol, while suppressing news of the attack on the temple. Thakur was finally arrested on February 6 only after the head of the army contingent posted in the area took

up the matter with the police.

A few days later, on February 12, the Muslim leaders in Pathanwadi abruptly shut the relief camp and NHSS activists were forced to rehabilitate the riot-hit families at their original sites under extremely hostile circumstances. Keeping constant vigil night and day, several attacks by lumpens were warded off, and by and by people began setting up home in the three bastis using the construction material donated by Nivara, Times Relief Fund, Rotary Club and other such bodies. But the fragile peace was broken on March 7 when, on Holi eve, a section of Ambedkar Nagar consisting of about 525 huts was burnt to the ground. The people suspected foul play. The police said it was a kerosene primus stove accident. Till date, the cause of the fire has not been established. But for the volunteers, their hands were full with rehabilitation work again, and with having to convince the angry Hindu dalits of Ambedkar Nagar that the culprits were not the Muslims of neighbouring Azad Nagar.

Then came the demolition by the forest department. Starting from Matangarh on April 22 and 23, the forest squad, protected by the Dindoshi police, razed over 2,000 huts in the area in a 10-day operation. The focus was on Matangarh, Azad Nagar and Ambedkar Nagar—wherever the riot-hit had tried to reconstruct their houses. In Ambedkar Nagar, only the precise section which had been burnt on March 7 was demolished. In Azad Nagar, Muslim houses, identified with a particular white plastic sacking material which they had received in riot relief, alone were demolished. All building material, donated for and bought by the riot-hit families, was carried away forcibly. Activists counted at least 25 trucks full of tin sheets, wooden poles and such material being carted off. Nivara Hakk Suraksha Samiti had donated about Rs 2 lakh worth of material—the money coming from a variety of groups and citizens—all of which is in government godowns today.

Those who resisted were brutally beaten up. On April 22, a section of Matangarh residents and others from neighbouring slums began raising slogans against the forest department. Led by senior inspector of Dindoshi police station, Khalkhamkar, the police unleashed a lathi-charge. Four persons were arrested. The most vile communal abuse was hurled at the crowd. The arrested activists found to their horror that at 12 noon almost all the police officers leading the operation were reeking of liquor. A sub-inspector, who could barely stand, accused the activists of being 'desh drohis'. On April 28 and 29, the same scene was enacted at Ambedkar Nagar and Azad Nagar. Youths who resisted the demolition were mercilessly beaten. A bulldozer was brought to demolish a

small school—the Bharat Ratna Ambedkar Vidyalaya—serving 400 children in the area. The superintendent of the school fell at forest range officer Lokhande's feet and begged him to take his life first. The drama averted the demolition for that day. Lokhande, however, promised to come back with his bulldozer.

The forest department claims that the slumdwellers have encroached on valuable forest land and are causing serious environment degradation of Bombay's green pocket. The slumdwellers say that forest range officer Lokhande, and before him range officer Patil, ran a lucrative business in netting hefty 'hafta' for allowing the slumdwellers to settle on forest land. Ambedkar Nagar residents say they are situated on I. E. Dinshaw Trust land and not on forest land. They also point out that the worst environmental degradation is being caused not by the slumdwellers but by the corrupt forest rangers who have flattened entire hills by selling mud and stones to building contractors. Matangarh's residents say they have the registration number of 27 trucks which ply up to five trips a day carrying valuable red 'garden' mud. That is why possibly Matangarh has seen its fourth demolition in five years. The 'hafta' is reportedly Rs 10,000 a truck.

But more than all this, it is obviously not a coincidence that the forest department, out of the 80,000 tenements along the National Park, chose the bastis where the riot-hit and the fire-ravaged dalits and Muslims were struggling to rebuild their lives for demolition.

On March 11, Gajanand Korteekar, Goregaon's Shiv Sena MIA, raised a discussion in the assembly that encroachers of the minority community had ruined the National Park. The state government promised to act and chief minister Sharad Pawar cleared the file for demolition. The riot victims, their lives fractured and smashed, now do not have even a relief camp to go to.

The series of events narrated above make it obvious that the communal war is far from over. Hindutva forces are determined to continue to target the Muslim community to keep the fires burning. Various arms of the state—the Bombay Municipal Corporation, police and other officials—have established a close nexus with Shiv Sena and other communal forces to carry on a subterranean proxy war for Hindutva against the Muslims.

Badanavala Killings

Signs for the Dalit Movement of Karnataka

Janaki Nair

The Karnataka Dalit Sangharsh Samiti has become a formidable organisation in the state. Relying on local resources and responding quickly to the daily abuses to which Dalits are subjected, the DSS has learnt to wield the legal-judicial machinery with some skill. This has made the Dalits the targets of new and varied atrocities and earned them the hostility of other political groupings such as the Raitha Sangha.

IN the last week of March, the people of Bangalore were treated to an excellent production of Devanur Mahadeva's novella *Kusumabale* by the Mysore repertory theatre, Rangayana. C Basavalingaiah's open air dramatisation stayed faithful to the difficult cadences of the dialect of the Mysore area which spoke of the multiple ways in which Dalits coped with unbearable oppression, through recourse to elaborate ritual, humorous defiance, traditional deference, or adoption of liberatory ideologies, while nevertheless paying a terrible price for the slightest transgression.

It was cruel irony that on March 25, in Badanavala, Nanjangud taluk, Mysore district, a village neighbouring writer Mahadeva's native Devanur, three Dalits paid with their lives for the sin of demanding admission to the newly-renovated Siddeswara temple in the village, renovations that had been made possible by Dalit money as much as Dalit labour.

Badanavala is a small village of 2,500 people, about 25 miles from Mysore city. During the period of Mysore Dewan Mirza Ismail's engagement with economic nationalism, Badanavala was chosen as the centre of a state-sponsored khadi production programme, and the village was even visited by Mahatma Gandhi in 1936, and was also the focus of the work of Tagadur Ramachandra Rao, referred to as the Mysore Gandhi, who undertook an epic fast for temple entry of Dalits in 1933. Today, there is little trace of the moral force of the religion of Gandhi, even less trace of any constructive work, and only the bitter reminder of the lingering antagonisms of caste, between the dominant Lingayat caste and the Dalits, who comprise the two major communities in the village.

There are nearly 1,200 Dalits, and about 1,000 Lingayats in Badanavala, the rest of the population of the village consisting of Ganigas and a few Muslims. In this dry area, the Dalits are mostly small farmers and agricultural labourers, while the

Lingayats too are medium-scale farmers, employing labour on their land. Both the Dalits and the Lingayats spoke of no history of hostilities, and indeed there have been no overt signs of discrimination with reference to water sources, shops, flour mill or fair price depot. Yet it is clear that the caste hierarchy was rarely challenged in any significant way till recently. In that sense, we may speak of the success of Ramachandra Rao's work for harmony within the caste order.

TEMPLE ENTRY ISSUE

The village square, which memorialises Gandhi with an armless bust under a canopy, has Dalit temples to Rama, Viriyamma and Maniyamma on three sides; on the fourth side is the red-tiled building of the Ambedkar Yuvaka Sangha. Even the topography of the village has been altered by the emergence of this new political force in the village. Since 1984, when it was founded, the Sangha has been built up by the growing band of educated, but disaffected, group of Dalits. The Dalits appear to have acquired a respectable degree of formal education, with over 100 youngsters who have completed their SSLC and nearly 50 graduates. Closely linked to the Dalit Sangharsh Samiti, which has built up a formidable base in nearly every taluk of Karnataka, the Sangha has organised educational, cultural and sports programmes, including a successful anti-liquor campaign, for all of which the village's proximity to Mysore has clearly been a help.

Plans were made a year ago to take advantage of the Bangarappa government's Aradhana scheme and renovate the Siddeswara temple, located some distance away from the village, to which devotees came from all the neighbouring villages, and from as far as Mysore. For this purpose, Parashivamurthy, the secretary of the renovation committee, appealed to the Dalits of Badanavala to contribute their mite. He may perhaps have been encoura-

ged by the false, but persuasive, unities of the Bharatiya Janata Party: in 1989, all residents of Badanavala, including the Dalits, had sent consecrated bricks for the Shilanyas programme at Ayodhya. But evoking this unity in the local setting was somewhat more difficult: younger Dalits, particularly the members of the Sangha, demanded that they be assured of temple entry when the renovations were complete. This assurance was given, and the Dalits contributed Rs 30,000 as well as 'shramdan' for the renovation.

The temple was ready for formal re-opening on January 30, on which occasion several Lingayat swamijis and the Lingayat Congress MLA of Nanjangud, M Mahadevu, as well as some other Dalit legislators were invited. Dalits who were born and brought up in Badanavala were, however, deliberately kept out, and even attacked by lathi and sickle-wielding Lingayat youths. The police, who were present, chose to book cases against 31 Lingayats and 26 Dalits under Sec 107 for disturbing the peace. Neither the swamijis nor Mahadevu chose to intervene in favour of the local Dalits' right to enter the temple.

A peace committee was constituted the very next day, which included the circle inspector, the deputy superintendent of police, the tehsildar and leaders of both the communities. The Lingayat leaders appeared to be in no mood to relent and asked for time till February 24 to 'consider' the question of temple entry. This, S P Kishore Chandra said, was unacceptable, and insisted that entry be permitted from February 1 or 2 itself. By February 2, the pujari of the temple had escaped and the temple was locked. Dalits gained entry into the temple only through police intervention from February 2.

Upstaged by the Dalits, who were clearly conscious of their democratic rights when they demanded police protection, the Lingayats were forced to withdraw from their indefensible position. But not for long: plans were already afoot to teach the Dalits of Badanavala a lesson, and daily consultations were held between Parashivamurthy and the local MLA.

The Dalits meanwhile planned a big puja after Ugadi on March 25, for which they requested police protection as early as March 22. Yet while some 16 Dalits were returning victorious from a cricket match in Aneyamballi village on March 25 at about 1 p.m., a group of more than 50 Lingayats armed with choppers, sickles and knives pounced on them and managed to kill three Dalits and severely injured two.

Among those who were killed in the well planned attack were B Narayana-swamy, a retired headmaster and his son Madhukar Nataraj, a school teacher. An old Dalit woman, witness of untold

discriminations and oppressions, recalled her shock and pain on hearing that the attackers included former students of the headmaster. So far about 36 of the 50-member gang of Lingayats have been arrested, and the entire set of able-bodied male Lingayats have gone into hiding, leaving only their women, children and old men behind. The surprising number of outsiders now occupying schools and every available public building are members of the police, 120 of them, who have kept any further reprisals at bay.

Badanavala's location, less than 200 km from the state capital, has made the incident prominent in the media and in the legislature, and has made the village the target of large numbers of Congress(I) politicians anxious to establish their liberal credentials. Chief minister Veerappa Moily, who also visited the scene, paid compensation to the families of the dead, ordered a CBI probe and announced that the state would stop 'tasdikis' (grants) to temples practising untouchability (even as he responded favourably to the suggestion from outraged legislators that the temple be taken over by the government). In addition, a fair number of swamis have visited the place, including the swamiji of Pejavar Mutt, a public and vociferous BJP supporter, who advised the Dalits to let bygones be bygones, and start living amicably with the upper castes. Dalit legislator C Motamma, who has been chairperson of the legislature committee enquiring into the various incidents of atrocities against Dalits, threatened that all 37 Dalit MLAs of the legislature would resign, but there appear to be no signs of that at all.

The Dalit Sangharsh Samiti, which responded quickly to the incident, held two demonstrations in Mysore and Nanjangud, demanding a detailed probe, dismissal of the circle inspector and punishment for the guilty. Yet, the Lingayats of the area, not to be outdone, and showing no sense of remorse for the incident, also organised a large procession and rally in Nanjangud under the leadership of MLA Mahadevu, where he demanded that the DSS, being even more dangerous than the RSS, be banned.

ON THE OFFENSIVE

As Mahadevu's support for the attack is becoming more explicit, he is seeking cover by going on the offensive. When asked why he made the statement about the dangerous nature of the DSS, he said that though the RSS is a communal organisation, it is working for 'high ideals' at a high level, but the DSS was interfering in daily administrative affairs, and were a daily harassment to the upper castes, who now have 'no peace of mind' due to the DSS and its 'goonda raj'. Referring to a similar confrontation between

the Dalits and Lingayats in Sargur in Heggadadevankote taluk of Mysore district, in which eight Dalits were killed about two years ago, the legislator insisted that the Lingayats had "been provoked into the attack". By Mahadevu's ingenious logic, activity of the DSS is at least as disruptive of communal harmony and is anti national as the activities of the RSS.

Mahadevu's statement is testimony to the ways in which the Karnataka Dalit Sangharsh Samiti has become a formidable organisation in the state today. Relying on local resources and responding quickly to the daily round of abuses to which Dalits are subjected, the DSS has learnt to wield the legal-judicial machinery with some skill. A large number of cases have been filed under the SC/ST (Prevention of Atrocities) Act of 1989 and the Protection of Civil Rights Act of 1955. Although a mere 16 of the 3,269 cases filed over the past three years have reached fruition, there is a persistent faith in trying to make that system work. There has also been a conscious attempt to build bridges with the police, long considered the implacable enemies of Dalits. Indeed, in at least three recent cases, the police have prevented attacks on Dalits from turning deadly, often by firing on upper caste mobs. In Devalaganagapur, Afzalpur taluk, Gulbarga district, a predominantly backward class village, three caste Hindus were killed in police firing in July last year when police tried to prevent a vicious attack on Dalits there. In Idapanur in Raichur district, a 2,000-strong mob armed with choppers, staves and knives was fired on by police as they came to attack the Dalits, and four were killed. In Hosdurg in Kanakpura taluk of Bangalore district, the village Vokkaligas who damaged and set fire to 66 Dalit homes were prevented from further violence through police intervention.

There is a political awakening among Dalits across the state over the past 15 years that has made them the target of new and varied atrocities. Dalits have even earned the hostility of other political groupings such as the Raitha Sangha, which resents the Dalits' lack of enthusiasm for the Sangha (which, it must be noted, has rarely taken up the case of agricultural wages, working as it does primarily for price increases which benefit middle- and large-farmers).

NEW SEGREGATION

There are no easy solutions to the spate of atrocities against Dalits that occur across Karnataka today. Politicians have always rushed to the spot of the atrocity and assured Dalits of separate flour mills, hotels and fair price shops so that friction may be avoided, yet, there is no question that this leads to new forms of segregation and cannot be the solution in the

long run. The Karnataka home minister, Dharam Singh, has more than once rashly promised to arm Dalits to help them defend their civil rights. The massive deployment of police in areas where there have been vicious attacks on Dalits again cannot be sustained for very long. The judicial process, slow and creaking at the best of times, has sorely tried the patience of Dalits who need immediate redressal of their grievances. No wonder that they have begun administering their own forms of justice, and used their organised force to extract at least the assurance of civilised behaviour from the caste Hindus.

The media attention trained on Badanavala contrasts sharply with the virtual non-reportage of the Hosdurg incident in which 66 Dalit homes were smashed or burnt by rampaging Vokkaligas. At least in part, the antagonism between the Lingayat MLA and Dalit MP, both of the Congress (I), has fuelled some of the curiosity over the Badanavala incident. It is perhaps an indication of the miles that the DSS, and the Dalits of Karnataka, have to go that nearly all newspapers continue to refer to them, not by the name they have given themselves, but as 'Harijans' and 'Untouchables'.

The future of the DSS in Karnataka, which started out as an organisation for transforming cultural politics, will depend on how it sustains the considerable energy that seems to have been released. This will demand, among other things, thinking through what is perhaps the most problematic of its interventions in Karnataka's villages: its response to the persistent charge that Dalits have molested upper caste women. In many instances, this has merely been dismissed as a form of caste justice for the centuries of abuse which 'our' women have endured at the hands of caste Hindus. The possessive pronoun betrays the fact that even the most propertyless of people have one form of 'property' over which power is wielded. Women have certainly not been inducted as democratic partners in the struggles of the DSS, and predictably there are neither women leaders in the DSS nor are women's issues part of the agenda.

The Badanavala events were in many ways no worse than the incidents that had occurred in Allagi-B, Idapanur or Sargur. The CID probe ordered by the chief minister can only be cold comfort to the Dalits of Karnataka, who have seen the appointment of a one-man commission on the Sargur incident, but have yet to hear of his report which was submitted to the government in November last year and has clearly been suppressed. Despite such paradoxes, the Dalit movement must continue to pursue as many avenues as possible in claiming a measure of dignity for Dalit lives.

Science and Superstition

Bharat Dogra

Instead of pursuing farmer-friendly science, India has opted for research which will be of interest only to business. In the circumstances, it is not surprising that farmers, perceiving this as deception in the name of science have espoused superstition and non-science.

INDIAN villages provide a strange paradox of life remaining heavily weighed by old religious beliefs and even superstitions, and yet not failing to respond to the possibilities of economic improvement made possible by science and technology. There cannot be better evidence of this than the extent to which green revolution agriculture has been taken up by farmers of Indian villages. According to the government's data for main foodgrain crops, up to 1991-92 67 million hectares of land had been planted with HYVs in the case of these six food crops. Even allowing for the expected exaggeration of data, this is a very impressive response on the part of farmers. As economist Ranjit Sau has commented, "This is an unprecedented diffusion compared to any innovation anywhere in the world."

But have the farmers been amply rewarded for their responsiveness to the call of modern science and technology? Far from this. The Indian experience of agriculture based on crop varieties which need heavy doses of chemical fertilisers, pesticides and herbicides is the same as the bitter experience of other places. After a time, more and more of these chemicals are needed just to maintain yields. Harmful pests develop resistance to pesticides and there is a never-ending search for newer formulation that can beat the bugs. But often it is the bugs which win. The genetic uniformity as well as lack of adaptability to local climatic conditions makes the new HYVs very susceptible to pest attention. Farmers' expenses escalate while the gains in yield, if at all these exist, are input much less than expected.

This leads to a loss of faith in science and the farmers turn easily to religious myths and superstitions from which they have not fully emerged. An anger against the establishment, which is perceived to be responsible for the economic ills, is mixed with strong anti-modern science feelings, which seek refuge in the comfort of old religious beliefs and superstitions. Such feelings can take dangerous sectarian and disruptive forms depending on the kind of provocation that is provided. There is an interesting anecdote from Punjab when terrorist violence was at its peak. Perhaps due to heavy pesticide exposure, birds in the region became dull and would not fly away on being approached by human beings so that their visibility in the fields increased. Incidentally these birds also resembled a powerful religious symbol. This led to rumours that these had been sent there by a great Guru so that injustice caused to the people could be avenged.

This anecdote shows how close the

farmers, even in the most intensive area of green revolution, are to religious beliefs and superstitions. In such a setting what is perceived as a failure of science, or deception in the name of science, can lead to a violent backlash that uses religious revivalist tendencies against the 'establishment' that is supposed to be responsible for the problems of farmers. How this 'establishment' will be defined will depend on local factors and the source of provocation/instigation but the fertile ground in which this provocation can spread fast is provided by the economic and ecological realities of green revolution farming.

In all this, of course, there is no failure of science as such. The same science could have been put to use for obtaining varieties which did not make the farmer dependent on chemicals but tried to increase yields to the extent possible by low-cost methods and materials which were available within the villages. Better yields could be obtained by improving the indigenous varieties which were well adapted to local conditions and less susceptible to pests and diseases. The same scientific knowledge could have been used for preserving rather than endangering the diversity of crop varieties available in many areas. But instead of doing all these

real long-term interests of farmers and opted instead for something that could bring quick profits for agribusiness in the form of sales of agrichemicals, machinery and seeds. The interests of business dominated the research for crop varieties but this was done in the name of helping the farmers.

Agriculture is just one example of such trends. Science and technology are used to serve the interests of big business vis-a-vis farmers and consumers and of rich countries vis-a-vis poor countries. Thus instead of having a liberating influence on the world which is still ridden by poverty and want on a significant scale, science frequently has an opposite impact.

Technology transfers across countries and continents have led to a situation where technologies which can have a very disruptive impact on the lives of millions of people can be imposed from above instead of evolving with the experience of people. It goes without saying that initially all the nice things will be said about the new technologies and a clever propaganda effort will be launched. People struggling at low levels of subsistence are likely to respond eagerly to any possibilities of growing "two blades of corn where only one grew before", specially as the longer term adverse implications are never explained to them. When the negative implications catch up with them, the resulting economic tensions and frustrations can erupt in violence.

Scientists and technocrats cannot remain unconcerned about the field-level impact of their work. There has to be a serious reconsideration of the impact that the spread of technology evolved with other aims but sold in the name of helping the poor has on the livelihood and contentment of million of villagers.

YOUNG MANAGERS AT THE CROSSROADS

The Trishanku Complex

PULIN K GARG & INDIRA J PARIKH

The management graduate is considered to be technically sound but arrogant and demanding. He or she is seen to be intolerant of superiors, hankering after an affluent lifestyle and given to changing jobs frequently. The purpose of this absorbing book is not just to test the validity of these perceptions but to explore the inner world of the young Indian manager

What emerges from this unique study is a sensitive portrait of a human being in search of values and the meaning of life and not just a crass person relentlessly pursuing success and material gain.

Total Literacy Campaigns: A Field Report

Nitya Rao

Establishment of mass literacy is a task that calls for sensitive and well-coordinated administrative skills and a political commitment that few governments in post-Independence India have had. Without mass organisations of the poor, without mass participation in programmes of social and economic development and without the universalisation of primary education, the gains of the literacy campaign will be difficult to sustain.

THE National Literacy Mission (NLM) was established in 1988, with the objective of revising and strengthening the existing adult education programmes in the country and making them mass programmes. Several evaluations were conducted by the Mission, and projects like the Rural Functional Literacy Programme, the Mass Programme of Functional Literacy, the adult education programmes of voluntary agencies and state governments were revised. These efforts did not lead to a satisfactory strategy for the eradication of mass illiteracy.

In 1989, a voluntary agency, the Kerala Shashtra Sahitya Parishad (KSSP) asked the National Literacy Mission for financial assistance for a mass campaign in Ernakulam district. The first Total Literacy Campaign (TLC) was begun in Ernakulam district on January 26, 1989, and from this experience was developed the 'TLC model' for mass literacy that is now being implemented in over 150 districts of the country.

An important conclusion of the international literature on education and literacy is that mass literacy is not a development outcome that is achieved merely with the passage of time: it requires a conscious and organised mass campaign. The Indian experience on this is clear enough. India's programmes of adult education, administered by the Department of Adult Education for several decades, failed to achieve any real progress in the field of mass literacy.

Internationally, campaigns to promote rapid increases in rates of literacy have involved the mobilisation of large numbers of learners and teachers, often by central authorities who have used elements of compulsion, ideology and social pressure to propagate literacy. In Nicaragua, the mass literacy campaign of the early 1980s was given the imagery and vocabulary of a national war to depose an oppressive social order and establish a new one based on mass empowerment.

Literacy is, of course, of intrinsic importance in the life of a human being. Literacy is also an instrument of empowerment. Awareness about social problems and structures, and information about development programmes can help transform lives, by enabling people to seek—and demand—better conditions of life. To be 'literate' in terms of the norms of the Mission, a learner must have basic literacy and numeracy skills, functional knowledge, usable in day-to-day affairs and social awareness.

Experience has shown that there are some innovative features of the total literacy campaign in India that are common to the different areas in which it has been implemented. The first of these common elements is its mass campaign approach. The TLC seeks to cover, in a specified time-period, the entire illiterate population residing in a compact, geographical area, usually a district. The second common feature of the campaigns is the participation of the people of the localities where the campaigns are on, in planning and implementing the campaign. Thirdly, campaigns are based on voluntary work. Panchayat-level, block-level, district-level and state-level organisations have been formed that are independent of, although supported by, local governments and administrators. Though the specific methods of mass mobilisation vary, the formation of such organisations is absolutely crucial to the success of the literacy campaigns.

While there are common features to the campaigns in different areas, literacy campaigns must also be sensitive to existing social conditions, to the conditions of life and work of people in specific localities, to the gender and age compositions of local populations, to the languages that people speak, and so on.

Essential to a literacy campaign are programmes that ensure that neo-literates do not relapse into illiteracy. It is well established that a neo-literate can revert to illiterate status in 8 to 10 months (and even quicker) if post-literacy campaigns do

not provide sustained practice in using literacy skills. This is even true of regions where base-level literacy is high, like Ernakulam district. Given that the potential for regression into illiteracy among neo-literates is always present, it is important that literacy comes to play a meaningful role in the lives of the neo-literates if literacy skills are not to be lost. Regression means the wastage of sizeable resources, both human and financial, spent during the campaign and, more important, the tragic loss of a skill that has taken much dedication and hard work to impart and inculcate.

Tanzania, an example of a country that emphasised post-literacy maintenance and development activities in its national literacy campaign, imaginatively used a variety of media to promote reading and writing skills; these included mobile libraries and rural newspapers. Textbooks representing different areas of interest were produced for learners. An overall functional orientation to the literacy campaign was adopted, which helped raise the literacy levels to over 80 per cent.

This is a report on the progress of the literacy movement in four regions of south India, namely, the Union Territory of Pondicherry, Pudukkottai districts in Tamil Nadu, and Nizamabad district in Andhra Pradesh. The report is based on field trips that I made to these areas in June 1992, as part of a study of strategies for the post-campaign phase of the literacy movement in these areas. It is premature to attempt a detailed analysis of the post-literacy campaign, but the directions that is now taking may be described.

PONDICHERRY

After Ernakulam in Kerala, Pondicherry was the second region in India to be declared 'totally literate' (Pondicherry was so declared in November 1991). About 67,000 people in the age group 15 to 40 years, 60 per cent of them women, were covered by the Total Literacy Campaign in the Union Territory. Initiated in September 1989, and organised by the 'Puduvai Arivoli Iyakkam', or Pondicherry Literacy Society, the movement gathered momentum after March 1990.

To administer the campaign, a committee with representatives from the government, political parties, voluntary organisations such as the Pondicherry Science Forum, Nehru Yuvak Kendra, and associations such as the NSS, was formed. The first task was to create an environment favourable to the campaign, by means of a massive publicity campaign involving mass conventions, 'kalajathas' (cultural shows and processions) and 'padayatras' (campaigns in which volunteers walk from place to place). The ob-

jective of these activities was to generate awareness for eradicating illiteracy, and to motivate and mobilise volunteers and learners to participate in the campaign. Ten cultural troupes travelled through the villages, popularising the message of literacy through more than 1,500 performances. To ensure community participation and continuity, which were critical to the success of the campaign, literacy committees—involving local youth club, women's organisations and teachers—were formed at the village, commune and district level.

The next task was training. There were two categories of people to be trained. The first was the category of volunteers, including key resource persons, master trainers and volunteer instructors, who were trained to teach a 3-part integrated primer. The second category comprised village and commune level organisers. About 13,000 volunteers were mobilised and trained.

The teaching phase lasted from about June 1990 to April 1991. The initial response to the classes was encouraging, with an enrolment of about 80,000 from an illiterate population estimated at 1,00,000. Several problems emerged: many were issues that could be expected to arise with the enhancement of public consciousness and a heightened awareness of basic rights among a population living in poverty.

Sustaining the interest of the learners and preventing drop-outs was difficult. The 'environment-building' efforts had succeeded in motivating illiterates to enroll themselves in the campaign. After all their daily chores, coming to the centre could be tiring and wearisome. There were other reasons for learners dropping out: some people felt that they needed to know only how to sign their names; the pedagogy of the campaign was often poor; the monsoon and festivals intervened. Those who already had some basic literacy felt disinclined to join the groups as they found nothing new or exciting on the agenda; they could not see its functional application in their lives.

The government's unwillingness to follow the programme through was, and is, a major obstacle in the way of the campaign. One lesson in the literacy primer raised issues of poverty and unemployment in India and of the iniquitous distribution of resources, and it called on people to struggle for a just society. Citing this chapter as "evidence", the speaker of Pondicherry's legislature actually called the Total Literacy Campaign "anti-national". The elected government of the Union Territory refused to sanction the post-literacy budget proposal, as a result, reading material for Pondicherry's 530 post-literacy centres could not be produced and, more important, large numbers of committed volunteers were disheartened.

Government policy has brought the post-literacy campaign to a virtual standstill in the Union Territory. A campaign that generated mass awareness, and sought to make the poorest conscious of their rights, was seen as being profoundly dangerous by the party and government in power in Pondicherry.

The village-level workers and many volunteers are young, and not equipped to organise adults around various social, economic and work issues. They themselves lack adequate information on issues of interest to the adult learners. Though an attempt was made, through a 'force of 80' highly motivated volunteers, to retrain village-level instructors and monitor the classes, they have not all been able to develop the organisational skills required for bringing the neo-literates together into literacy circles. In some cases, the volunteers worked with the expectation of future government employment, and when they did not get this, lost interest in the programme.

The response of women to the campaign was encouraging. They saw in the campaign a space for themselves, and an opportunity to interact with each other and to gradually bring about changes in social, and more particularly, gender relations. As part of the village-level committees, women's subcommittees were formed. These subcommittees raised a range of issues, including the need for more facilities for primary education, more public utilities, and (with rather less success) the organisation of income-generation projects for women.

The literacy movement had reached the masses, something which the government had been unable to do. Expectations about the benefits and impact of the literacy movement mounted. People began to expect it to provide solutions to all their problems and hasten the pace of implementation of development programmes. It is really not a criticism of the literacy campaign, but its inability to meet the expectations of the people in terms of the implementation of development programmes led to a decline in enthusiasm over the months. To take an example, twice there were floods in a fishing hamlet, and three rows of houses were washed away. The people of this hamlet wanted financial assistance for housing, but this issue could not be taken up by the literacy committee. The fisherwomen of the hamlet were being exploited economically by the contractors. To assist them by increasing their collection, the literacy society helped them install Fish Aggregation Devices. However, private launchowners smashed these devices.

When people perceive literacy as critical to their daily existence and see its utility in enabling them to live better, the motivation to strengthen their literacy skills also increases. To take an example, Father

Anthonisamy of the Holy Redeemers, who is also on the Executive Committee of the Arivoli Iyakkam, conducted a survey amongst four Arivoli groups and found that 85 per cent of the learners were in debt. Through the Holy Redeemers, those paying more than 10 per cent interest per month were helped to pay back their past debts immediately. An equivalent amount of money was deposited in the thrift and credit group that was organised around the learning group. The group employed the literacy volunteer to maintain its records and accounts. In addition to managing the thrift and credit society, the volunteer continued to help develop the literacy skills of the members. It is possible to tie such developmental work to literacy work.

Wherever functional literacy has become a practical reality and has been identified with local issues and priorities, the literacy movement seems to have made a deeper impact. In other words, literacy is an instrument for social justice and the empowerment of people.

Another development effort resulted from a 'social mapping' exercise undertaken in a literacy class. The group noted that only four out of 11 street lights worked in their street. A petition was written and sent to the electricity department. Quick action by the department became a source of motivation to the neo-literates.

Adult learners wanted to continue to learn, provided they found learning meaningful to their lives. The challenge facing the Arivoli Iyakkam was to plan and implement a post-literacy programme that would improve their work-skills, and help them find new forms of employment.

No literacy campaign can be successful if a programme of compulsory and universal primary education is not implemented. The literacy campaign had a direct impact on primary education in the union territory. In fact, the programme for adult literacy and Universalisation of Elementary Education (UEE) are really two sides of the same coin. As part of the post-literacy campaign, the activists of the literacy movement sought to arrange teacher training camps for the universalisation of elementary education as well as a 'back to school' campaign for drop-outs in the age group of six to 14 years. The government, however, did not sanction funds for the post-literacy programme, and this campaign has come to a halt.

Several members of the formal education system co-operated actively in the enrolment of drop-outs and of illiterate working children. Visalakshi Thangappa, headmistress of the government girls high school, created a separate section in the school for rag-pickers. A noteworthy achievement, she feels, is the enrolment of three exceptionally bright and talented children, who after a test, were admitted directly to classes 7, 5 and 4 respectively.

Prior to this, they were students in the TLC.

The fortnightly bulletin brought out by the Literacy Society, the literacy wall for transmitting news at different places in every village and hamlet, and the exercises in 'social mapping' have generated much interest among learners. However, the inadequacy of materials and finances for initiating new activities is becoming a major constraint on the progress of the movement.

PASUMPON DISTRICT

With the success of the TLCs in Kerala and Pondicherry, several districts in Tamil Nadu sent proposals to the NLM for launching campaigns in their districts. The first to be approved were the campaigns in Pasumpon and Kamarajar districts in March 1991.

The campaign in Pasumpon was launched in April 1991 under the aegis of the Pasumpon Mavatta Arivoli Iyakkam (the Pasumpon District Literacy Society). According to the 1991 Census, Pasumpon had a population of 10.75 lakhs, of whom 5.91 lakhs were literates. The campaign began with a major publicity drive, followed by a door-to-door survey that identified 1.08 lakh illiterates in the age group 15-35 years. Despite interruptions due to drought and mass migration in search of work, as well as the elections, teaching began in August 1991 and continued till May 1992. Approximately 15,000 volunteers were mobilised and trained to be teachers. About 90,000 illiterates enrolled in the classes, of whom about 80,000 acquired literacy levels as per the norms of the NLM. The district was declared 'totally literate' (that is, with a literacy rate greater than 80 per cent in the target age group of 15-35 years) in August 1992.

Pasumpon was the first district in Tamil Nadu to implement the TLC. The programme was developed taking note of the difficulties faced in other areas, particularly Pondicherry, and drawing upon the lessons learnt there. Thus, the TLC in Pasumpon district concentrated on and developed a network of participatory, grassroots, village-, panchayat- and district-level structures to ensure the continuity and sustainability of the movement. All voluntary organisations functioning in the district were involved, as were several government departments. Attempts to build the self-confidence of volunteers and learners, specifically women (who constituted 70 per cent of adults who enrolled) were made by organising training programmes and a variety of other activities such as talks, conventions and cultural shows. A significant contribution of the Pasumpon campaign was the introduction of a gram panchayat co-

ordinator, a link person between the district centre and the village centres, who was identified and appointed by the village people themselves.

Though the overall base literacy rate for Pasumpon (55.01 per cent) was marginally higher than the state average, the gap between male and female literacy was among the widest, next only the Pudukkottai district. In response to this finding, the activists of the campaign attempted to establish women's literacy committees right down to the village level. Almost every village had a woman convener.

The women's committees were active in several blocks, especially Ilayankudi and Tirupattur, and tackled diverse issues, from street lights that didn't work to water scarcity. About 800 women were trained in organisation and public speaking. The women's literacy committees also helped to train people in tasks such as the production of palm leaf baskets, for which the resources existed locally. In some cases, the committees sought assistance under the Development of Women and Children in Rural Areas (DWCRA) programme (an example is a pickle-making unit at Ilayankudi). Fifty DWCRA groups were formed, most of them at the initiative of the village-level women's literacy committees, and they involve both learners and volunteers in their activity.

The literacy committee also took on, with the assistance of the General Insurance Corporation, a programme to popularise personal insurance. More than 2,000 people were insured (the premium was nominal). Two claims have already been filed. Insurance helped people recognise that every life is valuable, and boosted their self-image.

A noteworthy, and well known, feature of the Pasumpon literacy campaign was a programme to teach women karate. Competitions between block-level karate groups were held. This training helped women realise their own strength and lose many of their fears and physical inhibitions.

During the campaign phase itself, there were several initiatives to encourage literacy activities and build a sustained interest in learning. To take some examples, inland letter forms were distributed to volunteers, postcards were written to and by learners, and they were encouraged to fill in money-order and ration-card forms. Several competitions and functions, health camps and 'kalajathas' (cultural performances) were organised by the Arivoli Iyakkam.

The campaign attempted to spread the message that universal elementary education is necessary. A survey that attempted to find out the reasons for school drop-outs found that many people thought school education to be irrelevant and with

no practical utility in their lives. A pilot project on activity-based teaching, which relates learning to activities of daily life, was begun in Ilayankudi block.

Sustaining the achievements of the literacy programme requires much organisation and dedication and also political commitment to mass literacy. The organisers hope that the village-level organisations that have been created will be committed to sustaining literacy as well as linking literacy to income-generating development programmes. The next two years will be crucial in determining the success of the TLC.

The post-literacy phase must seek to strengthen and further develop the achievements of the campaign phase. The agenda includes a supplementary project to cover about 9,000 illiterates in the 9-14 age group and another 38,000 in the 36-45 age group who were not part of the target population in the first phase of the campaign.

As economic survival needs are often pressing, continued voluntary effort on a long-term basis, despite high motivation levels among many of the volunteers, may not be a practical possibility. A new feature of the Pasumpon literacy movement is a two-year programme at the block level to improve the academic level as well as the economic condition of the volunteers. The plans include an academic component to enable volunteers to complete their matriculation, and a vocational-skill-training component, compatible with local resources and needs. Providing them opportunities to enhance their capacities is justified recognition for the commitment and dedication shown by the volunteers during the literacy campaign.

Such a programme would take care of numerous young people like Chandra. Chandra's brother refused to let her teach in the Arivoli centre as a volunteer as there was no money in it. She wanted to participate in the programme, for the experience and joy of achievement it gave her, and so she lied to him that she received Rs 250 per month as honorarium. During the day she worked as a wage labourer and managed to earn this amount, which she gave to her brother every month.

Neo-literates also gain access to training through TRYSEM, benefits under DWCRA, loans through IRDP, and technical assistance from government extension departments, universities and other voluntary bodies in the areas of agriculture and ground water resource development. An attempt to utilise the cable TV network for communicating some of this information was made.

PUDUKKOTTAI DISTRICT

In Pudukkottai district there was a further refinement of the TLC. Pudukkottai, according to the 1991 Census, had 6.62

lakh illiterates out of a total population of 13.22 lakhs. The campaign for total literacy was initiated on July 23, 1991, by the Pudukkottai Mavatta Arivoli Iyakkam, a society registered under the Societies Registration Act. After a hectic initial motivation phase, teaching began on October 2, 1991. As against an initial estimate of 2.3 lakh illiterates in the 15-35 age group, the survey identified 2.9 lakh illiterates in the 9-45 age group. Teaching continued till the end of July 1992, when an external evaluation was conducted, and the district was declared 'totally literate' on August 11, 1992.

Over 26,000 volunteers were mobilised in the district. They taught in the literacy campaign without any payment. The programme was co-ordinated at the district level by government officials as well as a diverse team of full-time Arivoli workers.

Although Pudukkottai was ranked 16th in the state in terms of the percentage of literates to total population in the 1991 Census, the gap in literacy rates between males and females was the highest in the state, 24.3 percentage points. To correct this inequity, women's literacy was emphasised right from the beginning of the campaign.

The response and involvement of women at all levels, not only as learners, but also as master-trainers and assistant project co-ordinators has been tremendous. A major reason for this special emphasis and sensitivity to women's needs, as in Pasumpon, has been the presence of women District Collectors, who were committed to the programme of mass literacy, Qudsia Gandhi in Pasumpon and Sheela Rani Chunkath in Pudukkottai, who spear-headed the campaigns in these districts. They were supported at every stage in this effort by activists of the Tamil Nadu Science Forum, and its president, Venkatesh Athreya, who is also the State Literacy Co-ordinator.

Women's committees were formed at the district, block, sub-block and panchayat levels. These committees were involved in a wide variety of activities. First, 'Meet the Learners' and 'Back to School' campaigns to motivate parents to send children aged between five and eight years back to school were organised. Secondly, the identification of women for various training programmes was carried out. Thirdly, competitions, meetings and conventions were organised at village centres to discuss issues that could not be handled by the volunteers, such as issues of dowry, wife-beating, and economic exploitation. Fourthly, members of the literacy campaign dealt with conflict situations, for example, a movement of women agricultural labourers who demanded minimum wages from a landlord at Pudur. Fifthly, women learners were helped to write their own

petitions to government authorities and to work out their own problems. Through such activities, campaigners tried to generate awareness and develop people's confidence in literacy committees, and attempted to create a credible organisational base for sustaining both literacy and other development activities.

A hallmark of the strategy in Pudukkottai seems to have been to link the movement for literacy with the lives and livelihoods of the people right from the start. This has not only provided a constant source of motivation to the learners, but has also facilitated close co-operation between the district administration (especially the revenue, development and education departments), the full-time Arivoli staff and the learners. It encouraged learners to take leadership positions and assist the administration wherever possible. I shall describe some of the women's groups that I visited.

The district has about 450 quarries, which were controlled by private contractors. In 1991, when the quarries were brought to auction, the contractors refused to bid at the floor price, expecting to be able to depress the price, as they usually were. The collector organised about 3,000 women workers into groups of 20 each and gave them quarrying rights at nominal rates for three years. There are now about 150 such women's groups. They were provided loans of Rs 1,000 each from the Indian Bank for tool kits, uniforms and initial working capital. The members earned a daily wage of Rs 20 to Rs 30 (a four-fold increase in daily earnings), and shared the profits every week. It has been a struggle to retain the women's contractual rights. The contractors, deprived of their quarry rights and profits, tried different ways to destroy the groups. They refused to allow trucks into the area. Help from the police had to be sought. They told group leaders that they would not be permitted to sell stones, which the contractors claimed for themselves, on account of their initial investment in the quarry.

I had the privilege of visiting several of the quarry groups in Annavasal, Thirumayam and Viralimalai talukas. The literacy campaign helped the women workers in this fight against the contractors by helping them gain confidence and learn the ropes of the business. They were able to petition the Assistant Director (Mines) at the district headquarters directly for their permits and seek his guidance in operational matters. They have now learnt to write out their own bills and receipts, and maintain their production accounts, and they can see that self-reliance is critical for ensuring the sustainability of their gains. Two of the group leaders, Vasantha and Anjalai, who were totally

illiterate, showed us their accounts. They have learnt how to keep them by attending the regular Arivoli classes and with some special assistance from the volunteer. The volunteers were given special training in maintaining accounts and records for these women's groups. More and more women workers began to attend the literacy classes.

Another group I visited at Iluppur was a group that worked at cutting and polishing artificial gems, using power-run machines. There are now 56 groups of 20 women working at this trade in the district, and another 50 groups are undergoing training prior to formal registration. Involving as it does the operation of machines, in the initial phase, literate women, with a minimum of five years of school education, were organised into these groups and given loans through a nationalised bank. The earning potential in this trade was about Rs 30-40 for an eight-hour working day. The women began to repay their loan instalments at the rate of Rs 100 per week.

Seeing the earning potential of this trade, many women joined the Arivoli classes in order to be able to work at gem-cutting. They were agricultural labourers who earned Rs 6-7 for a day's work. Employment quotas were observed, for scheduled caste women, for destitute women and for others from the most oppressed sections of the rural population. The new gem-cutting trainees were all neo-literates, and neo-numerates. Numeracy is important as the cutting of the stones has to be accurate and in accordance with the calibrations on the machine.

An imaginative feature of the literacy campaign, which can be emulated by literacy workers elsewhere, was to provide bicycles to women. Almost 1,500 bicycles were made available in the rural areas through low-interest loans to Gram Sevikas, anganwadi workers, and others. 'Cycle-rallies' and bicycle demonstrations by women were also organised.

The levels of achievement of literacy and other basic cognitive skills varied, of course, within hamlets, and within centres. At the same time, a major strength in Pudukkottai has been the even distribution of master trainers over all panchayats. They are in the ratio of one for every 20 volunteers. It should be possible to use their services for further training. This is important, as volunteers are often too young and inexperienced to sustain the interest of learners, especially when learners are adults who often require more experienced trainers.

NIZAMABAD DISTRICT

The total literacy campaign in Nizamabad began with a survey and 'environment-building' work by the

Nizamabad Zilla Aksharasyatha Samithi, in September 1991. According to the 1991 Census, Nizamabad has a population of 21.49 lakhs, of whom only 21.7 per cent were literate. The survey identified 4.5 lakh learners in the district in the 15 to 35 age group. Teaching began in December 1991 and continued till July 1992. The district was declared 'totally literate' on August 15, 1992, with an estimated 3.5 lakh learners having achieved levels in accordance with the NLM norms.

The TLC in Nizamabad took a form that differed from those described above. Nizamabad is an area where Naxalite activity is particularly high and the TLC could not get off the ground if it had to face Naxalite hostility. Normal life is often disrupted by violent incidents, the law and order situation is very problematic, and people are often not willing to leave their homes after dark. During the initial survey and mobilisation phase, the atmosphere was quite tense and district officials had to move in villages with armed security men. They were unable to make much progress or generate the atmosphere of openness among the people that is essential for a campaign. The Naxalite groups then made an announcement through the local press that they would support the Campaign for Total Literacy as this was a pro-people programme. This eased the tension considerably and permitted the programme to develop in the district.

A second problem was the extremely low literacy rate in the district, as low as 16 per cent for females in the rural areas. It was hence difficult to get older, experienced volunteers. Most of the volunteers were young, middle or high school students.

Thirdly, almost 50 per cent of the learners in the district are bidi workers, most of them women. They sit in workshops, and that is where their centres run too. They learned to read and write, but being under the supervision of the contractors, it was very difficult to make them aware of their rights or organise them to demand that even basic facilities, such as drinking water and toilets, be provided them by the contractors. Deductions are made from their wages for medical contributions, rents of workshops and transportation costs. They do not know if their provident fund contributions are remitted regularly. They continue to face shortfalls in raw material, especially *tendu* leaf. The location of the literacy centres, the inexperience of the volunteers and the lack of involvement of the bidi workers' trade unions in the TLC, limited its scope in the district.

The lack of local organisations has meant that the entire campaign has been led by the officials, government machi-

nery. At the district level, special officers were appointed for each mandal. It was primarily the responsibility of these officers to develop mandal-level organisers and panchayat and village-level coordinators.

Given this background of the district, special efforts had to be made to secure public participation, and not keep the TLC restricted to being a 'government programme'.

The TLC created great enthusiasm among the poor and among women, especially Muslim women. Celebrations, competitions and other programmes were arranged at frequent intervals; these included a Mahila Prerana Utsavam (festival for the motivation of women), sports events, songs and rangoli (colourful floral patterns) competitions. Health camps and baby shows (!) were organised for general health awareness and also for specific issues, such as the prevention of gastroenteritis. Opportunities were provided to volunteers and learners to speak on the local radio station of their experiences. Camps were organised at which small peasants met functionaries from the agriculture and veterinary departments. These activities provided people with a space for expression and social interaction.

As it happened, in Nizamabad, four senior district-level administrators took it on themselves to work hard at the literacy programme in exceptionally difficult circumstances. They perceived this programme to be an entry point, the first step towards improving the implementation of other district-level development programmes.

A campaign such as the one in Nizamabad depends very much on the specific person who leads it. A case in point is the Bodhan subdivision, which performed much better than the others in the literacy campaign. The sub-collector of Bodhan personally motivated people to join the literacy programme. He collected a group of local singers at his residence, they composed and practised literacy songs together and produced them in the form of an audio-cassette with the assistance of All India Radio. He visited the centres often and tried to solve local development problems immediately. The same progress in the literacy campaign did not take place in other areas.

The establishment of mass literacy is a task that calls for sensitive and well-coordinated administrative skills and a political commitment that few governments in post-Independence India have had. Without mass organisations of the poor, without mass participation in programmes of social and economic development, and without the universalisation of primary education, the gains of the literacy campaign will be difficult to sustain.

DESTINATION L.S.E.

London School of Economics & Political Science 1980s' Scholarship Fund

The London School of Economics & Political Science 1980s' Scholarship Fund offers 3 scholarships for the Academic Year 1993-94. These are available only to the candidates who have received confirmed admission at the London School of Economics & Political Science, London, for a post-graduate course of study including taught post-graduate course or research degree in Economics and other subjects. The British Foreign & Commonwealth Office has most generously agreed to pay the full amount of fees for each scholar, directly to the School. The L.S.E. 1980s' Scholarship Fund will award upto £ 4000 to each scholar annually towards maintenance.

An Education Commission Reports

Tapas Majumdar

The education commission set up by the West Bengal government under the chairmanship of Ashok Mitra has, by implication at least, left us in doubt about what it thought of the state of education in the state.

THE government of West Bengal had set up an education commission in August 1991 under the distinguished chairmanship of Ashok Mitra. It was asked to look comprehensively into the state of education in West Bengal since 1977. The base year was considered an important landmark presumably because a Left Front government in its present shape had first come to power in West Bengal that year. The education commission completed its task and submitted its report just within a year (by August 1992), which must be by itself regarded as quite a commendable achievement, considering the spread and unevenness of the educational terrain that the commission had been called upon to cover.

The setting up of an education commission has usually been universally accepted as both an important event and a well-meaning gesture in India. Having appointed a commission, government too normally accords its report all respect even when it has reasons to heartily disagree with some of its crucial recommendations and is eventually found loth to implement even those measures that it pretends to endorse. Political parties in India canvassing diametrically opposed policies on almost every other aspect of life have also been known to pay obeisance to the same education commission reports: Recall, for example, the generous treatment and good press accorded to the report of the education commission headed by D S Kothari (1964-66) in contrast to how its follow-up, the National Education Policy (1968), was received. The truth of the matter is, people in this country, even governments, have been accustomed to find a body of the stature of an education commission to be not only wise but also reasonably detached if not wholly objective, and to be willing to raise public debate on genuinely controversial issues. It is usually *not* seen merely as a vendor of settled government policy. Lest this characteristic be attributed only to the strength of our democratic polity, I must add that the tradition in this respect goes back even to British times. We would find it if we read again the Report of the Calcutta Univer-

sity Commission (1919), for example, over which Michael Sadler presided and on which Asutosh Mookerjee not only sat as a formidable and turbulent colleague but also influenced its outcome.

The Ashok Mitra commission report too deserves to be placed in the same class as that of its many distinguished predecessors. My only disappointment however is that it has not always been able to distance itself sufficiently from specific

partisan positions of the government with the finesse of a Sadler, Radhakrishnan or Kothari. Even so, in the end, some of its recommendations (like increasing student fees fairly drastically, enforcing accountability of errant and often truant teachers, banning private tuition) are, in effect, challenges thrown in the face of the Left Front government. We will have to wait for some time before the West Bengal government can recover its composure and respond.

It was only in 1981 that the last education commission in West Bengal was set up. It was called the Commission for Planning of Higher Education in West Bengal and the chairman was no other than Bhabatosh Datta. It must have been recognised by the government of West Bengal even then that in formulating education policy there was no way one could plan for 'higher' without sparing a thought for 'lower' levels. And so the

TABLE 1: BUDGETED (REVENUE) EXPENDITURE PER CAPITA ON EDUCATION IN EIGHT SELECTED MAJOR STATES, 1990-91

State	Per Capita Expenditure on Education (Rs)	Share of Education in State Budget (Per Cent)	Share of Higher Education in Education Budget (Per Cent)
Assam	206.75	20.36	7.28
Gujarat	253.92	20.94	8.21
Karnataka	209.76	21.70	16.46
Kerala	252.11	25.29	13.64
Maharashtra	222.92	18.17	8.62
Punjab	268.87	21.81	12.44
Tamil Nadu	200.46	21.21	7.71
West Bengal	250.39	26.04	11.05
All India	193.34	19.94	10.49

Note : The eight selected major states are those that are found (see Table 2) to have consistently above the all-India average literacy rates. They also have (with the exception of Karnataka) higher proportions of school enrolment in the state population. The six consistently below the average performers are Andhra Pradesh, Bihar, Madhya Pradesh, Orissa, Rajasthan and Uttar Pradesh.

TABLE 2: TWO INDICATORS OF EDUCATIONAL ATTAINMENT IN EIGHT SELECTED MAJOR STATES

States	Literacy Rates (Per Cent)		Proportion of School Children in Population	
	1981	1991	1980-81	1985-86
Assam	NA	53.42	14.29	18.92
Gujarat	49.96	60.91	17.77	19.46
Karnataka	43.97	55.98	15.56	14.92
Kerala	80.51	90.59	22.11	21.05
Maharashtra	53.94	63.05	15.64	19.92
Punjab	46.72	57.14	18.23	16.97
Tamil Nadu	53.46	63.72	18.84	21.06
West Bengal	45.78	57.72	17.57	18.43
All India	41.42	52.11	15.34	16.61

Note : The literacy rates for 1981 exclude only the age group (0-4 years) while the 1991 Census excludes the age group (0-6 years).

Source: Government of India official publications including Census of India 1981, 1991 (provisional) and Education in India, various years.

Datta commission was also asked to suggest, amongst others, "measures for improving the standard of education at all levels", along with "special measures for giving a new direction to higher education in conformity with the projected requirements of economic and social growth". The Bhabatosh Datta commission had submitted its classic report in April 1984 but for all these years I have not been able to find out what the government of West Bengal really thought of it. In the event it did seem somewhat peculiar that in the setting up of the Mitra commission, the government of West Bengal found no occasion even to refer to it. The Mitra commission almost followed suit and its report also contains no detailed discussion of the earlier report.

If by asking the education commission to look at changes in the education scene since 1977 the government of West Bengal was actually fishing for compliments and an indirect endorsement of its party line, then its hopes may have been at least partly fulfilled, for the commission began its report in an extraordinary way. It started by recounting, of all things, the Left Front's election manifesto of 1977. Many of the objectives therein seemed laudable enough though they clearly fell short of being either particularly leftist or revolutionary. Promises to establish a Secondary Education Commission and enact a comprehensive public library legislation were clearly among these. On the other hand, there was the promise to take steps to fight "imperialist penetration in the cultural field". Then there was the promise to take steps towards the realisation of the right of education through all the mother tongues of the state: Bengali, Urdu, Nepali and Santhali, right up to the highest stages! All this, I suppose, was the usual brave talk before all elections and I wonder if the Left Front would particularly thank the education commission for so zealously recording it for posterity.

As to achievements, as distinguished from promises, several pats in the back the West Bengal government did have from the commission. The commission praised the government for ensuring at last that examinations were being held regularly again in West Bengal and mass copying severely dealt with. More substantively perhaps, it commended the government on two other counts: spending a relatively high proportion of the state budget on education and giving lower priority to higher education within the budgeted expenditure on education. How meaningful are these latter claims?

Table 1 below contains some information on these two points for eight major states of India. These are the states that have been consistently better than average performers in terms of educational attainments among all the major states in India.

For selecting the 'group of eight' I have used only two simple indicators: the rate of literacy and the proportion of school-going children in the state populations, as shown in Table 2.

The tables seem to bear out three propositions. First, West Bengal does spend proportionately more on education out of its revenue budget than all other states. Even Kerala spends less. Though in terms of per capita expenditure on education West Bengal spends less than Gujarat, Kerala and Punjab. However, the second proposition is that the share of higher education in West Bengal's education budget is not low. It is higher than the all-India average and much higher than the shares of higher education in Assam, Gujarat, Maharashtra and Tamil Nadu among the better performing major states.

How much we spend on education, however, is not the main question that the economist has to ask. The main question is: Are we getting good value for the money spent? A look at Table 2 should tell us that the answer is: most probably, not—and this is our third proposition. West Bengal has been, not only in 1990-91 but consistently over the years, just as the education commission had thought, top of the league table in terms of the proportion of budget expenditure on education. But alas, it has remained significantly worse off in terms of literacy rates than Gujarat, Maharashtra, and Tamil Nadu, not to speak of Kerala. In terms of school enrolment it is worse off than Gujarat, Kerala, Punjab and Tamil Nadu. It is not unreasonable then to suspect that West Bengal's education system is one of the

more wasteful within the relatively progressive 'group of eight' among the major states. Which is not a big pat in the back.

I would, however, be giving a very wrong impression of the Mitra commission report's thrust if I only made these possibly just captious criticisms of its government-friendly stylistic approach that irritates, and not remind the readers of the genuinely revolutionary nature of some of its recommendations that I had referred to at the beginning. Looking at these one feels that the commission could not have been entirely unaware of, or unconcerned with, the sad state of affairs that our Tables 1 and 2 together seem to indicate.

In fact, the Mitra commission has, by implication at least, left us in no doubt about what it thought of the state of education in West Bengal. In calling for substantially higher college fees, in insisting that the teachers be forced to *teach*—ensuring their accountability to society through inspection and other ways—and in demanding that the widespread malpractice of using school hours and school children for extracting money in the form of private tuition be ended, the commission had indeed bared the ugly face of academic institutions in India in a way no other previous commission had dared to do. But perhaps this was not what the government of West Bengal had actually bargained for, or even what the commission had anticipated when it had started to write its report. Perhaps only someone's irrepressible maverick character had triumphed in the end! The people of West Bengal should feel grateful for that

RAW in Sri Lanka

Rita Manchanda

Indian Intervention in Sri Lanka: The Role of India's Intelligence Agencies by Rohan Gunaratna; South Asian Network on Conflict Research, Colombo, 1993.

WHAT happens when in a democracy foreign policy becomes a captive to covert intelligence operators? The Iran-Contra affair is the obvious example, an object lesson on the risk of intelligence agencies hijacking the diplomatic process. Closer to home there is Pakistan's Inter Service Intelligence (ISI), a virtual autonomous power centre which is accused of directing a 'proxy war' in India. Daily, newspaper headlines denounce the subversive and terrorist activities of the ISI in India. Ministers of the government publicly accuse the ISI of being responsible for terrorist activity ranging from the training and arming of militants to the Bombay bomb blasts.

And for those who take comfort in the argument that such subversion of the foreign policy process is possible only in a presidential system of government as in the US or Pakistan, a transitional democracy where the military is part of the ruling troika, ask our neighbours across the Palk Straits. In the 80s, Colombo accused India's Research and Analysis Wing (RAW) of training and arming Sri Lankan Tamil militants.

It is the covert operations of the Indian intelligence agencies which is the subject of Rohan Gunaratna's book. His imaginative reconstruction of the role of RAW, IB, CBI and the 'Q' branch of the state of Tamil Nadu holds up a disturbing mirror image of the virtual takeover by covert intelligence operators of the handling of India's Sri Lanka policy over the heads of the ministry of external affairs (MEA).

Gunaratna's book stands out as the first systematic attempt to track the role of the intelligence agencies in India's Sri Lankan operation. He maintains that it was RAW which ran the country's Sri Lanka policy. From the training and the arming of the Tamil militants to conducting a 'proxy war' through the covert Tamil National Army to undermine the LTTE-Premadasa negotiated truce, it was RAW which juggled the dual policy of counterbalancing the arming of the LTTE with working for a political resolution. MEA was kept informed on a need-to-know basis.

Of course, the view is from Colombo and may even be a sponsored one for Gunaratna had access to top secret documents in Sri Lankan government files. This includes the top secret communications between prime minister Rajiv Gandhi and president Junius Jayewardene through the hitherto unknown RAW

channel and even the minutes of a secret meeting between the then RAW chief A N Verma and the Sri Lankan president which the ministry of external affairs was not supposed to know about, though it may have been leaked to the Indian high commissioner J N Dixit through a friendly RAW agent in Colombo.

The Colombo documents lend impressive credibility to Gunaratna's painstaking piecing together of what the founder of RAW, R N Kao, is quoted as having described as India's 'disaster' of a policy of training and arming the LTTE (p 26; all page references in parentheses are to the book under review). But it is an uneven patchwork of press reports, interviews and the classified documents. Moreover, while there is an impressive list of people interviewed, including former foreign secretary M Rasgotra, the Indian high commissioner to Sri Lanka, N N Jha, and president Jayewardene, closer scrutiny will reveal that more often than not these were marginal players. Key protagonists like RAW chief Girish Saxena and his successor A N Verma were not interviewed nor was J N Dixit.

At an exclusive meeting in Colombo on April 28, 1988, Verma is quoted as telling president Jayewardene, "Dixit is presently not held in favour by the Indian prime minister and does not play any significant role in the process of negotiations" (p 345). The reasons cited by Verma behind Dixit's waning influence with the prime minister were "firstly, the public disclosures of payments made to the LTTE on the eve of the accord, secondly, his arrogance and overbearing attitude and thirdly by his conduct and actions which has made him extremely unpopular with Sinhalese and Tamils" (p 346).

Fact or fiction? There is no footnote to indicate the source of this information. Was it the minutes of that top secret meeting? Inevitably, in the shadowy world of covert operations, the sources will remain confidential. What makes for scepticism is when Gunaratna's sources lead him to believe that there could be secret training camps for Tamil militants in such densely populated areas in the capital as Greater Kailash Part II, R K Puram and Sadtagen (sic) Development Area and Green Park.

RAW's takeover of the *ad hoc* training camps for Tamil militants earlier sponsored by co-ethnic elites in the state of Tamil Nadu began in October 1983. Ac-

cording to senior RAW sources it was known to only six people in the prime minister's office and about 10 others, including in the RAW, and disinformation specialists threw out that the training was being done clandestinely by the militants themselves with the support of the co-ethnic political elites of Tamil Nadu.

Gunaratna claims that under Indira Gandhi a supra covert organisation comprising operatives from RAW and IB was created called the 'Third Agency' for subversive operations in Punjab and the training and arming of Tamil militants. The burden of proof rests solely on Rajeev Bajaj's article in *Surya* magazine.

The objective of the Sri Lankan operation was to destabilise India's southern neighbour and not to divide the island into two. Gunaratna quotes M K Rasgotra who was foreign secretary from 1983-84, as saying, "it was to give a message to Jayewardene" (p 53) as there had been an influx of Sri Lankan Tamil refugees in the wake of the July 1983 ethnic riots and the 'spill-over effect' in Tamil had to be contained. Rasgotra did not believe that Indira Gandhi authorised RAW to subvert Sri Lanka by training and arming the militants. "Sheerest nonsense I have ever heard! I cannot imagine she would ever do it," he said (p 54).

The first concrete piece of evidence that India was subverting Sri Lanka came from a small group of Tamil youths arrested by the security forces. In his reconstruction of the trail, he details how a specially hand-picked group of young refugees from Trincomalee whose homes had been gutted in the 1983 riots were taken from Tamil Nadu to New Delhi. There they were trained in the use of 9mm pistols, AK-47 rifles, Indian SMGs, in the manufacture of parcel bombs, laying of booby traps, use of radio communication and surveillance techniques. They were then taken to Bombay harbour and taught how to identify various vessels before being sent back to Jaffna.

Subsequently, the office of the national security advisor hired a European video journalist who under the cover of being an Australian journalist made video recordings of the training camps for the Sri Lankan government. Initial training was made available in Chakrata near Dehradun, R K Puram and near the Delhi international airport. According to the director-general of intelligence and security in Sri Lanka, by 1987 an estimated 2,000 LTTE, 8,000 PLOTE, 1,500 EPRLF, 1,250 EROS and 1,500 TELO cadres had been trained in north and south India. A few months before the 1987 accord, 200 crack militants nominated from all the groups were given training in the use of surface-to-air missiles.

Jayewardene's son, Ravi Jayewardene, claims that when he met Rajiv Gandhi in

1985, Gandhi was ignorant of the covert role of RAW. Gandhi told him it was hard to believe that even half that number of youth had taken up arms. A few months earlier Jayewardene in a classified letter to Rajiv Gandhi conciliatingly proposed, "let's forget the issue of training camps... I ask you to help me prevent them from coming here with arms and also prevent Sri Lankans from seeking refugee in your country. If we can agree on a common scheme... it will enable me to withdraw armed forces".

But while a series of special envoys from India were trying to work out a political solution to the ethnic crisis arms and explosives provided by RAW continued to be smuggled from the Tamil Nadu coast to landing-points in Jaffna. The objective was to push Colombo to pursue a political rather than a military option. An escalation into a full-fledged civil war would in its 'spill-over effect' on Tamil Nadu raise the spectre of a Dravida Desam or a greater Eelam.

That the 'message' conveyed to Colombo could take the most brutal form was chillingly brought home on May 3, 1986 when a Tristar plane of Air Lanka was blown up minutes before departure from Colombo killing 16 people and injuring 41. "There is suspicion in the Sri Lankan intelligence community and even in India's defence establishment that RAW was behind the airline bomb" writes Gunaratna (p 130). To this date the culprits have not been identified.

RAW opposed the 1987 accord. It had been brokered by the PMO and the MEA. The intelligence agencies were marginal to the diplomatic process. But it was the RAW, the IB and the 'Q' branch which knew the militants. RAW cautioned that nothing short of Eelam would be acceptable to the LTTE, which had emerged as the dominant militant group.

As for the provision about the merger of the north and eastern provinces to be decided by a referendum, Gunaratna quotes Jayewardene as saying that Rajiv Gandhi gave false assurances to Prabhakaran that the referendum would never be held on the basis of a misleading brief from Dixit that the Sri Lankan president had given such an assurance to the Indian high commissioner (p 191).

When the LTTE reneged on the Indo-Sri Lankan accord and the Indian Peace Keeping Force (IPKF) was ranged against the LTTE, RAW agents continued to talk with the LTTE. Their assessment was that the military option would bog down India for decades in Sri Lanka. Therefore, on March 5 as part of the ongoing RAW-LTTE talks LTTE leader Lt Col Johnny had been flown in an Indian air force plane from Madras to Vavuniya. On his return while carrying a letter from Prabhakaran to Rajiv Gandhi, he was killed by an IPKF patrol. The IPKF was not aware of the RAW plan. Gunaratna adds, "even if they knew, it would not have mat-

tered as they had no mutual respect for each other at least on the ground" (p 265).

And to corroborate his assertion he quotes from GOC IPKF Jaffna, Lt Gen Sardeshpande's book, *Assignment Jaffna*: "Most of its [RAW's] operatives were amateurish, methods ludicrous and processing of intelligence selectively convenient. Its findings and assessment did not help us much in our 30-months venture and evoked even less confidence in its output and quality..." (p 266).

How wrong RAW was in its assessment of the LTTE was a lesson that the IPKF was to learn at great cost to life and morale of the Indian forces. Contrary to the assumption that Prabhakaran's men were urban guerrillas and would not be able to fight a rural guerrilla war, even India's trained troops in counter-insurgency were intimidated by the LTTE.

The IPKF commanders were not the only ones kept in the dark. Even Dixit did not know about the RAW-LTTE talks as he was considered *persona non grata* with the LTTE. Both Jayewardene and Dixit complained to New Delhi to put a stop to RAW talking to the LTTE, as it was felt that the LTTE had to be tamed militarily and not politically as the RAW was attempting. Gunaratna claims that to scuttle the talks between the LTTE and RAW, Dixit exposed the payments made to the LTTE by RAW to a journalist.

That the RAW, MEA, the IPKF and the Tamil Nadu government were often pulling in different directions is officially acknowledged by high commissioner N N Jha who when explaining the failure to mediate between the Tamil groups and the Sri Lankan government said, "I feel too many people got involved in this, each time a different person coming... Too many cooks spoil the broth" (p 400).

For Gunaratna it was the covert role of RAW which shaped India's Sri Lanka operation. From 1983 to the departure of the IPKF in 1990, RAW's Sri Lankan specialist Chandrashekhara alias Chandran succeeded in establishing India's position as a regional power. Jayewardene's flirtation with the US, Israel and Pakistan were effectively nipped in the bud. It had made Indira Gandhi all the more hostile to the Sri Lankan government and when the crunch came, the US adopted a hands-off policy.

RAW deliberately put out exaggerated reports of western penetration of Colombo to legitimise playing the militants card. As the former Sri Lankan National Security Minister Lalith Athulathmudali told Gunaratna, "RAW wanted a stick to beat Sri Lanka. India wanted to control her surroundings... They had an obsession that Trincomalee was being given as a base to the US—absolute rubbish" (p 342). The exchange of letters appended to the 1987 accord officially recognised that in its backyard New Delhi would not tolerate any government threatening India's security by leasing out the Trincomalee harbour

or establishing a Voice of America station without Indian concurrence.

Gunaratna frames the covert operations of RAW in four phases. The first, the pre-October 1984 phase, is aimed at destabilising the Jayewardene regime. In the second phase, from October 1984-1986, RAW plays off one militant group against another in an effort to control them. LTTE emerges the strongest. The third phase, 1986-1990, is marked by RAW's unsuccessful efforts to control the LTTE. And the fourth phase is the assassination of Rajiv Gandhi by the LTTE. With the re-establishment of intelligence sharing between the Sri Lankan and Indian intelligence agencies against the Tamil militants, we come a full circle.

Gunaratna's publication coup is his disclosure of the top secret intermediary role played by RAW between the heads of government of the two countries on three different occasions. And he has been able to back this by reproducing the confidential letters exchanged. RAW's direct link with Colombo became strong in November 1986 when LTTE supremo Prabhakaran was resisting a political settlement. He wanted war. The second was just before the 1987 forced air-drop. And the third in 1988 during the IPKF operation when RAW tried to negotiate a deal between the LTTE and the Sri Lankan government.

Arguably, diplomacy is best done discreetly, with delicate negotiations insulated from the pulls and pressures of a democracy. And a source close to the RAW bosses alluded to the coup that RAW helped to pull off when through the intermediary role of RAW and its Pakistan counterpart (ISI?). General Zia-ul-Haq and Rajiv Gandhi successfully worked out a solution to nearly all the problems facing India and Pakistan. In his last interview before his assassination, Rajiv Gandhi had told Barbara Crosette of the *New York Times* that had General Zia lived India and Pakistan would have worked out a resolution of "all problems". Both the foreign offices of India and Pakistan denied it. They had been kept in the dark.

What had been the secret clauses, the *quid pro quo*? In a democracy people have the right to know. And the RAW chief reports only to the prime minister. India's Sri Lanka adventure is enough of a cautionary tale about what can go wrong when intelligence agencies are allowed to hijack the diplomatic process. The mastermind behind the assassination of Rajiv Gandhi, Sivasaran, had been trained in the use of arms and ammunition, explosives, intelligence and communications in Tamil Nadu by RAW in 1984. The LTTE learnt the use of RDX used in the bombing of Rajiv Gandhi from RAW experts.

During the V P Singh government parliament did establish a committee to bring the functioning of the intelligence

agencies under its purview. Under scrutiny was whether RAW and IB had been misused to spy upon political opponents. Contrary to what Gunaratna implies, the clean sweep of all the prime minister's men did not include the RAW chief. Verma was kept on by V P Singh.

Covert operations are by definition undercover, issues of legality and illegality are blurred. As the former RAW chief Kao told prime minister Morarji Desai, "there are no legal means of collecting intelligence abroad". (See Ashok Raina, *Inside RAW*, p 69.) There are no friends or allies, only alliances of convenience. According to the former Mossad agent, Viktor Ostrovsky, Israeli counter-insurgency agency Shin Beth was training at one and the same time Tamil militants, Sri Lankan government elite troops commandos and Indian commandos, but in different camps.

Gunaratna quotes from K Mohandas's *MGR: The Man and the Myth* in which the former Deputy Inspector-General of Police (intelligence) Madras, claims policy-makers in Delhi advised him to protect the Tamil militants. "If we continued along the known lines of investigation in the [Meenambakkam] airport blast case, the Sri Lankan government would officially take advantage of it and proclaim to the world the existence of militant training camps in India", Mohandas was told (p 109).

The name of the game is skulduggery and disinformation is a part of the bag of tricks. Prabhakaran is given out to be ill, dying and dead to cast a spanner in the LTTE-Premadasa talks. More sinister was the conscious suppression of intelligence about acts of sabotage and terror. It is not only Mossad which chose to underplay intelligence about the plan of a Shiite group to attack the US Marine base in Lebanon in which 243 Marines were killed.

In the raising of its proxy force, the Tamil National Army, RAW did not let niceties such as the mass kidnapping of Tamil youths come in the way of achieving its objective. In retaliation for Jayewardene's successor, Premadasa's unilateral declaration that the IPKF should be withdrawn by July 1989, RAW had worked out a blueprint for pushing the pro-Indian north-eastern council to unilaterally declare Eelam.

TNA was used by RAW to disrupt the fragile truce between the Premadasa government and the LTTE. In an effort to create tension in areas where the IPKF had recently been withdrawn, Gunaratna claims on November 17, 1989, 700 TNA cadres attacked six police stations in the eastern province. "The man, handpicked to initiate the operation was David, a senior RAW officer" (p 366). A couple of days later 600 cadres attacked a rest house, housing an army camp and the Kalumnai police station in Batticaloa district. Their victims were not only the policemen but

also the recruits to the Citizens Volunteer Force which had been trained by the IPKF. Neither the chief minister of the north-east, Perumal, nor the Indian army brass knew of the operation.

Gunaratna's book is the view from Colombo. But with Indian policy-makers and the brass now coming forward with

their account of India's Sri Lanka story, former sleuths may also come forward with their version. If the lesson of what happens when a country's diplomacy is hijacked by the intelligence agencies is to be properly absorbed, it is necessary to take a dispassionate look at why things went so wrong.

South-South Trade Preferences and Prospects

V V Bhanoji Rao

South-South Trade Preferences: The GSTP and Trade in Manufactures edited by Hans Linnemann; Sage Publications, New Delhi, 1992; pp 236, Rs 240.

FACTS, logic and comparative advantage may dictate North-South free trade and factor mobility; but the world's political economies are not ready for that. In the meantime it is expedient for the South to exploit whatever intra-South trade expansion is feasible. In such a context, explorations into South-South trade preferences are welcome. The volume under review is one such explorative venture.

In April 1988, an agreement on Global System of Trade Preferences (GSTP) was signed at Belgrade by 46 members of the Group of 77. Ratification by 15 signatories will bring the agreement into force. The idea of GSTP among developing countries was proposed in 1976 at UNCTAD-IV (Nairobi). Within UNCTAD, however, while the Group of 77 pushed the idea, OECD and eastern European countries opposed it. Linnemann in his introduction notes: "After 1983, most of the preparatory work for the GSTP would seem to have taken place outside the UNCTAD framework as such, with India taking the lead" (pp 14-15).

The volume reports the findings of a research project undertaken at the Economic and Social Institute of the Free University, Amsterdam, under the auspices of the Indo-Dutch Programme on Alternatives in Development which in turn was sponsored jointly by the Indian Council of Social Science Research and the Dutch Institute of Social Science Research in Developing Countries. Hans Linnemann, Pitou van Dijck, Els Hoogteijling, Herman Verbruggen and Cees van Beers wrote the various chapters.

Since most low income countries have relatively high levels of import tariffs, the key question is the extent to which a preferential lowering of tariff and non-tariff barriers leads to growth in South-South trade in manufactures. This is the principal concern of the book under review.

PREFERENTIAL TRADING: RATIONALE AND FEASIBILITY

Chapter 2 deals with the rationale and feasibility of preferential trading among developing countries. After describing the benefits of trade liberalisation *a la* Krueger, Bhagwati, Srinivasan etc, the following warning is given:

In a rationed economy or in a situation in which price controls are widely used and the exchange rate is overvalued, liberalisation of the trade regime may have negative consequences for production and welfare, as has been the experience with several liberalisation attempts (p 25).

The above warning should not be interpreted as a negation of the benefits of trade liberalisation; instead, it is an affirmation that along with trade liberalisation (or well before a high degree of trade liberalisation) one needs to ensure that price controls are removed and the exchange rate is market determined. Inevitably also, attention has to be paid to the impact of liberalisation on employment, poverty and welfare in general.

Does trade liberalisation (reducing tariff and non-tariff barriers) definitely lead to gains from trade via reduction in domestic costs and prices? Where, for instance, duties are kept very high, the difference between current domestic price and world market price adjusted to duty may be so great that a relatively low reduction in duty may not have any impact on the domestic price. In addition, tariff reduction may have reduced impact when there are non-tariff barriers alongside tariffs.

What are the obstacles on the way to creating a preferential trading system (PTS)? The chief obstacle arises when the PTS members as a group suffer a reduction in welfare. For realising welfare gains through PTS, the required conditions are: import demand should be price elastic (thus, as PTS partners reduce tariffs and costs, trade expansion takes place), price differences among countries should be large and, of course, price differences between PTS members and the rest of the world should be small (otherwise, imports from the rest of the world will surge).

Relatively small markets in partner countries and inefficiency of domestic industries compared to those in partner countries hinder domestic industrial expansion in a PTS. An implication is that large countries are attractive as members of a PTS and thus enjoy a bargaining position in its formation. But there is a danger that even inefficient industries in the large countries may outcompete industries in small countries simply because of the existence of some economies of scale

in the former prior to PTS. Thus even though in the post-PTS regime the small country costs will be lower at the post-PTS aggregate demand level, at the time of PTS negotiations, however, costs may appear relatively lower in the large country and hence confer a bargaining power on that country's inefficient industries.

GSTP MECHANISMS

The third chapter deals with the historical evolution of GSTP and GSTP mechanisms. It all began with the disenchantment of developing countries with the results of the Kennedy Round (1964-67) of GATT. The various initiatives since then resulted in the presentation of a proposal to establish a preferential trading system among developing countries at UNCTAD-IV in Nairobi in 1976. At UNCTAD-V in Manila (1979), the Group of 77 called for the establishment of an UNCTAD Trade Information System as a support mechanism for negotiating the PTS. The system came into operation in September 1981. In October 1982 a GSTP Committee was established to prepare and conduct the negotiations. Finally, in April 1988, 46 members of the Group of 77 signed the agreement establishing a framework of rules for a PTS. Bilateral trade preferences negotiated between those countries during 1986-88 were multilateralised.

"The GSTP intends to reduce tariff and non-tariff barriers and aims at an even distribution of the overall benefits of such reductions among participating countries" (p 60). While all tariff and para-tariff concessions are to be given on a most favoured nation (MFN) basis to all countries participating in the negotiations, least developed countries will enjoy the preferences without the need to reciprocate. Also, existing/future preferences among regional groupings need not be extended on the MFN basis.

In GATT negotiations, the earlier product-by-product approach has been found to be complicated and time-consuming. From the sixth GATT round, the focus was on the formulation of across-the-board tariff cuts, with exemptions. This continues to be the preferred approach.

As for non-tariff barriers (these are relatively more significant than tariff barriers in the developing countries) a standstill on them is required during the period of negotiating tariff reductions. Exception to this is envisaged in respect of the least developed countries.

In respect of rules of origin, one option is the percentage criterion. This involves the specification that a certain minimum percentage of value added should have occurred in the country exporting a product under PTS. The other option is to specify a required degree of transformation of input into output such that, for instance, the two fall under distinct CCCN (Customs Co-operation Council Nomenclature). This criterion is also referred to as a 'BTN Jump'. The first option is simple to operate. Thus the ASEAN PTS, for instance, has a stipulation of at least 50 per cent value addition. In the GSTP, both options are to be used in different product categories.

The circumstances when safeguard measures are needed are when a country has balance of payments difficulties or when domestic producers are threatened by a sudden increase in imports under PTS. In GSTP, it is envisaged that the safeguard measures should be applied in a non-discriminatory fashion among the participants.

CURRENT REALITIES AND FUTURE OF GSTP

As noted earlier, governments accustomed to customs revenue and industrialists deriving protection from trade barriers may not be expected to wholeheartedly move towards a high degree of trade liberalisation. This message is brought out in Chapter 4 with the help of quantitative analyses.

Trends in trade in manufactures are studied in Chapter 5. South-South exports as a proportion of total exports did show an increase in the post-1970 period except that in the mid-1980s the proportion declined marginally. There is scope for expansion of South-South trade in manufactures, especially in capital goods.

The structure of protection and South-South trade in manufactures is the subject of investigation in Chapter 6. "The observed wide inter-country difference in average tariff levels poses a number of serious problems, assuming that in the first instance a linear across-the-board approach to tariff cutting is adopted" (pp 169-70). Since GSTP uses a linear percentage reduction, the problem of unequal concessions will dominate any negotiations in future. (Note that a 20 per cent cut leaves an 80 per cent tariff at 64 per cent and a 40 per cent tariff at 32 per cent; this is the inequity.) The protection regimes are also characterised by high

rates of protection for labour-intensive consumer goods and relatively low rates for capital goods.

Chapters 7 and 8 are the most useful and worthwhile chapters in the entire volume. Chapter 7 indicates the potential for trade expansion based on prevailing (1980) commodity composition of trade in manufactures. The conclusion that emerges is that a few strong countries will gain the most from GSTP in the short run. The analysis, however, has little significance for the long term as the next and final chapter shows.

The final chapter looks at the possible effects of GSTP tariff reduction. The following conclusions are significant: (1) A 20 per cent linear tariff cut leads to a 5.5 per cent growth in South-South manufacturing trade, while a 50 per cent cut leads to a 15 per cent trade expansion. (2) The long-term effects in both instances are much larger (14 per cent and 42 per cent trade expansion, respectively). Despite the limitations of those empirical findings the general thrust of the conclusions remains valid.

With the general distrust of the inward-looking policies, there is not much choice for development strategies except to embark on outward orientation. Without simply waiting for the Uruguay round to be concluded at some future date, some countries have taken initiatives towards PTS, resulting in NAFTA and AFTA. They reinforce the general direction of trade policy being articulated by the multilateral agencies and adopted by an increasing number of countries, especially those that cannot exercise effective regulations.

President Clinton is presently seeking extension of fast track authority to December 15, 1993 in respect of the stalled GATT negotiations. Under fast-track negotiating authority, Congress can consider the package in its entirety without offering amendments. (Under earlier authority due to expire on June 15, the GATT package should have been ready by March at the latest.) Meanwhile the Japanese cabinet approved a report recommending continued self-sufficiency in rice, opposing the Dunkel draft proposals on farm products to replace all farm import barriers with tariffs. While the trade frictions between the US, Japan and Europe continue, it will be good if GSTP makes progress.

As the data in the accompanying table show, between 1985 and 1991 world exports almost doubled from \$ 1.8 trillion to \$ 3.5 trillion. Exports from the South, however, did not expand at the same rate. Thus, South did not maintain its exports share, let alone obtain an increase. However, South-South exports rose in terms of their share in South's total exports. Extrapolating on these trends, one should recommend not only more South-South trade, but also a higher share for the South in world trade. Both can be achieved within the context of global rather than just regional trade liberalisation.

TABLE: WORLD EXPORTS AND SOUTH'S SHARE

	1985	1988	1991
World exports (\$ billion)	1813	2690	3454
South's exports (\$ billion)	544	706	957
South's share (per cent)	30.0	26.2	27.7
South-South exports (\$ billion)	164	229	328
South-South share in South's exports (per cent)	30.0	32.4	34.2

Structural Maladjustment

Bangladesh's Experience with Market Reforms

Rehman Sobhan

Bangladesh's reform programme remains in deep crisis because it has, over a decade, failed to accelerate growth, diversify the economy, stimulate investment and domestic savings and create the basis for a sustained growth process which can lead to greater self-reliance and substantial reductions in mass poverty. It may be convenient for the IMF and the World Bank to blame successive governments in Dhaka for their failure to implement reforms and for current Bangladeshi regimes to attribute the poor results to the malfeasance of their predecessors. But a decade of economic stagnation needs more substantive and less self-serving diagnosis if Bangladesh is to join the ranks of a resurgent South Asian region, let alone its more dynamic neighbours to the east.

I Introduction

BANGLADESH has been exposed to a decade of structural adjustment reforms. In fact Bangladesh had initiated a number of economic reforms some of which date back to the mid-1970s which could fall within the construct of structural adjustment reforms. These included measures to expand the role of private enterprise, reducing subsidies on agricultural inputs, some measure of exchange rate adjustment and massive monetary reforms to reduce inflationary pressure on the economy [Islam 1977].

It is thus somewhat misleading to periodise a reform process since policy-makers in Bangladesh and indeed in many other developing countries have been reforming various facets of the economy in the direction of promoting private initiative, competition and market forces over two decades. The point of departure in Bangladesh has however been that the reforms of the period 1972-82 were largely undertaken in response to specific problems faced by the economy at the time and short-term exogenous shocks. The reform process since 1982 has been much more holistic in its coverage, attempting to change the entire direction of the economy towards a private enterprise dominated market economy. This is not to say that prior to 1982 the Bangladesh economy was a largely command economy since the contribution of public enterprises to GDP did not exceed 15 per cent which was well below levels in Taiwan, Malaysia and even the Republic of Korea [Sobhan and Ahmad 1980]. This was not surprising in a small farmer dominated agrarian economy with a large service sector. Thus even the changes initiated since 1982 are part of a continuum in the process of reforming what was and remains a mixed economy.

In this short paper it is intended to briefly review the area and phasing of the reforms and to review the reform processes in the context of that period. We will then discuss the outcome of the reform process in the area of growth, structural change, privatisation and economic openness.

II Course of Reform

The term structural adjustment (SA) has originated from the Bretton Woods Institutions (BWI), the World Bank and the International Monetary Fund (IMF). The adjustment process as used by the BWI is better understood as an instrument for realising certain goals rather than as an end-product of development. The SA process thus emphasises such institutional changes as the substitution of the public sector by greater economic activity by the private sector, the use of market forces to guide production and allocative decision and the attempt to expose an economy to greater openness in the way of import liberalisation and export promotion. These instruments are deployed through the medium of policy reforms and institutional changes. However it must be kept in mind that the reforms are not ends in themselves. They are intended to promote more sustainable economic growth, investments, exports, better living conditions for all segments of the population and greater democratisation of economic opportunities.

POST-LIBERATION REFORM PROCESS

In the post-liberation period after December 15, 1971, Bangladesh inherited a rather over-regulated economy based on import controls, foreign exchange rationing, an overvalued exchange rate, subsidised pricing for food under public distribution as well as for publicly provided

agricultural inputs and institutional credit. About 34 per cent of the value of fixed assets in the modern manufacturing sector was contributed from public enterprises [Sobhan and Ahmad 1980].

In the aftermath of liberation the share of public enterprises in manufactures increased by another 43 per cent because of enterprises abandoned by the Pakistani owners, who had prior to independence dominated the trading, financial and modern manufacturing sector of pre-liberation Bangladesh. As a result the state expanded its role in manufacture, banking, insurance and trade. Some nationalisation of local capital took place but since the indigenous bourgeoisie was underdeveloped and had only evolved over the previous 10 years under heavy state patronage, the decisive influence in expanding the public sector was the circumstantial pressures arising out of independence rather than a categorical commitment of the ruling party to build a command economy.

The post-liberation regime in fact, *ab initio*, committed itself to divest some two-thirds of the smaller abandoned enterprises over which it had assumed control in December 1971. It had also begun a process of bringing the price of public goods closer to the market price, had carried out two devaluations of the taka in December 1971 and again in March 1975 and had introduced, at the end of 1974, the most severe measures of monetary contraction undertaken before or since, which contributed to a drastic reduction in the rate of inflation by the autumn of 1975 [Islam 1977]. However at the time the regime changed in August 1975, the direction of the economy was not significantly different from what it was in the 1960s.

REFORMS IN 1975-82 PERIOD

During 1975-82 more emphasis was put on promoting private sector development.

Notwithstanding the suspension of the EFF disbursements, the deteriorating macro-economic balances in the economy kept the GOB under pressure from the BWI to carry out a stabilisation programme. The new martial law regime which seized power in March 1982 was more responsive to BWI pressures and initiated a series of measures to improve its balances [Rahman 1991].

However by the beginning of the 1980s the BWI had embarked on its course of structural adjustment reforms throughout the third world. Most such countries had for reasons similar to Bangladesh in 1980-81 faced severe exogenous shocks both due to the adverse movement in their terms of trade and for some, due to the escalation in debt service obligations due to the global rise in interest rates and the recessionary economic conditions in the global economy triggered off by the tight money policies of the Volcker-Reagan administration in the US at the beginning of the 1980s. With the resultant collapse in commercial bank lending the BWI emerged as the primary source of finance and intermediation with the commercial banks for purposes of debt rescheduling which gave them unprecedented leverage in directing reforms within affected third world economies. The BWI however chose to treat the macro-economic instability of 1980-82 not as the result of a short-term exogenous shock but as the outcome of longer term structural maladjustment in most third world economies as a result of faulty policies. It thus used its critical position in the global financial system to pressurise all its prospective borrowers to embark on an agenda of macro-economic stabilisation backed up by an agenda of reform which broadly covered the areas of import liberalisation, exchange rate adjustments, financial deregulation, fiscal reforms, desubsidisation of public goods, and development of private enterprises. These reforms were intended by the BWI to make most third world countries more likely to realise a path of sustainable growth based on a more outward oriented development strategy [Sobhan 1992b].

From 1982 onwards Bangladesh went through a similar pattern of reforms indicated above. During the period 1986-89 Bangladesh again took recourse to the IMF under its Structural Adjustment Facility (SAF) and again between 1990-93 took resort to the IMF's Enhanced Structural Adjustment Facility (ESAF) [Rahman 1991]. Both programmes involved agreement over a Policy Framework Paper (PFP) negotiated between the GOB and IMF which sets out the agenda of macro-economic reforms during the period. The commitment of the GOB to

the PFP provides the seal of approval of the other aid donors to pledge aid to Bangladesh every year in April at the Aid Consortium meeting convened by the World Bank in Paris. The PFP negotiated by the GOB with the IMF in Washington in August 1990 is currently the guideline for the prevailing economic reform agenda. It spans three regimes, that of president Ershad (ousted in December 1990), the interim government of president Shahabuddin Ahmed (December 1990-March 1991), and the incumbent government of prime minister Khaleda Zia, elected to office in March 1991.

REFORM PACKAGE

The PFPs are backed up by series of SA loans extended by the World Bank and Asian Development Bank as either programme or sector loans. These loans provide cash foreign exchange to the GOB to carry out a series of policy and institutional reforms in particular sectors or areas of the economy. Some of the areas covered by these loans include the Industrial, Energy, Financial and Agricultural Sector loans from the World Bank and the Food Crop Sector loan and Industrial Sector loan of the Asian Development Bank.

The IMF related loans commit the GOB to a regime of macro-economic stabilisation on its budgetary and balance of payments account, monetary stability and competitive exchange rates. The sectoral loans of the World Bank and ADB cover such areas as desubsidisation of agricultural inputs and public utility services, financial deregulation, import liberalisation, fiscal reforms, divestiture of public enterprises, improved revenue collection and management of public utilities.

It should be kept in mind that some of these reform programmes predate the era of structural adjustment. The World Bank and USAID have since 1977 been introducing conditionalities into various lending programmes to disengage the GOB from distribution of fertiliser and control over irrigation equipment through the Bangladesh Agricultural Development Corporation (BADC). Similar pressure has been applied to reduce the GOB's involvement in the PFDS and particularly to end the subsidised food rationing system to the urban areas. Discrete pressure to promote privatisation has been applied from the 1970s and substantial resources from the World Bank, ADB and KfW Bank of Germany have been channelled through the DFIs to promote lending to the private sector [Sobhan 1991b].

In the remainder of this paper we will briefly discuss the extent to which these reform agendas have been put in place and

will then go on to discuss some of the outcomes of these reforms.

II

Macro-Economic Reforms

The GOB has put in place a programme of budgetary stabilisation through measures to enhance public revenue collections and reduce public expenditures. The fiscal deficit has fluctuated between 7.9 per cent of GDP (Table 1). It rose to 11.2 per cent in 1982-83 and was then reduced through a programme of expenditure cuts. In the latest year, 1991-92, the deficit is down to 5.2 per cent of GDP [World Bank 1993]. This would suggest some success in budgetary stability. In fact the concept of budgetary stability as a measure of macro-economic performance is somewhat meaningless for an essentially aid dependent economy.

Bangladesh's budget deficit, measured as the gap between public expenditures and revenue, is in fact inherent in its dependence on aid. Annual commitments of development aid to Bangladesh imply that the government must plan to spend more than it earns to accommodate the disbursements of external aid. The size of the budget deficit is thus determined less by the budgetary management skills of the GOB and more by the actual commitment and disbursement of development aid by its donors. While disbursements are high due to improvements in disbursement procedures and more effective aid utilisation by the GOB, the deficit will increase. Conversely, a reduction in the deficit means a decline in the level of development expenditure and deterioration in aid utilisation. This trend is clearly manifest as an explanation of Bangladesh's low budget deficit in 1991-92.

Table 1 shows that the share of the Annual Development Expenditure (ADE) to GDP has declined from 10.6 per cent in 1980-91 to a low of 5.8 per cent in 1991-92 [World Bank 1993]. This unremitting decline over the last decade has reflected

a growing weakness in the development effort. Correspondingly the aid utilisation ratios have also declined from a measure of 115.7 per cent in 1980-81, 93.7 per cent in 1990-91 and 94.3 per cent in 1991-92. Project aid utilisation ratios (20 per cent of the opening pipeline of aid in the current year) have declined from 139.8 per cent in 1980-81 to 100 per cent in 1990-92.

The reduction in the budget deficit was thus not realised by a significant cut in total public expenditure (TPE) but a contraction in development expenditure. Thus the revenue expenditure-GDP ratio has risen from 6 per cent in 1980-81 to a high of 9.6 per cent in 1988-89. In 1989-90 to 1991-92 it averaged 8.9 per cent. Thus the TPE/GDP has remained in the region of 15/16 per cent.

The slight improvement in the revenue collections in the last two years has helped to underwrite the rising volume of current expenditure so that the budget deficit has not risen as it was doing in the 1985-90 period due to rising current expenditure. The current fall in the deficit however remains the end product of declining development expenditure and remains a measure of the weakness of the development effort over the last decade. There are many reasons for this relating to weak governance and low administrative efficiency which need more extensive discussion than is possible in this paper [Sobhan 1993a].

STABILISATION OF EXTERNAL ACCOUNT

Bangladesh's macro balance on external account is also an artificial construct determined by the volume of aid disbursements. An improvement in the balance of payments usually reflects a decline in the share of imports. The import/GDP ratio has in fact declined from 17 per cent in 1984-85 to 15.1 per cent in 1991-92 (Table 1). Merchandise imports in nominal terms have stagnated and in 1991-92 stand at \$3.46 billion compared to \$3.76 billion in 1989-90 [World Bank 1993]. In real terms import values have

been declining over the last five years. In contrast, exports have done better and the export/GDP ratio has risen marginally between 1979-80 and 1991-92 though it is still about the same level it was today as it was in the mid 60s when jute was king. Today garment exports have been doing exceedingly well to compensate for the decline of jute. But the fact that only 15/20 per cent of the external earnings from garments are retained at home means that the net increase in earnings has been less dramatic. Similarly the rise in earnings from overseas remittances has made a significant contribution to our external earnings rising from \$379 million in 1980-81 to \$848 million in 1991-92 [World Bank 1993].

However, the reduction in our external deficit owes little to these success stories and derives largely from import stagnation. Had in fact Bangladesh sustained its import/GDP ratio at even the mid 1980's level, the external gap would have been wider by at least 2 per cent of GDP. It could have been higher if the economy had been more dynamic and the import/GDP ratio rose. It was thus the sluggish demand for imports and low level of development activity which led to weak aid utilisation which compressed the external resource gap. In these circumstances we have much less cause for optimism about Bangladesh's path to self reliance if this in fact derives from economic recession and ineffective aid disbursement. Thus Bangladesh's external reserves by June 1992 were at an all time high of \$1.7 billion which is equal to six months of imports compared to the traditional one and half months sustained by its reserves through the 1980s. Bangladesh's aid pipeline has now swollen from \$2.86 billion in 1980-81 to \$5.84 billion in 1991-92 [World Bank 1993]. As a percentage of annual imports this reflects a rise from 121 per cent to 166 per cent.

Bangladesh's full reserve coffers and bulging aid pipeline are now exercising a negative effect on our real effective ex-

TABLE 1 FISCAL AND EXTERNAL SECTOR INDICATORS

change rate which has remained relatively stable over the 1980s because inflation has kept pace with the nominal depreciation of the taka. In fact at a market clearing level our exchange rate in the second half of the 1980s has remained relatively steady because buyers of foreign currency are having their needs satisfied from the aid budget and full reserve position. Pressure on the GOB by the BWI to depreciate the exchange rate is thus a command policy decision and not a market determined decision [World Bank 1993]. The problem faced by an aid dependent economy such as Bangladesh is that due to its built-in external deficit, derived from the criticality of aid to its development effort, an equilibrium exchange rate cannot be scientifically determined and must be derived from the accident of economic performance and efficiency of aid disbursement.

The ritual games played between the IMF and the GOB over the appropriate exchange rate thus remain rather academic and have little influence on the export promoting propensities of the exchange rate [Rahman 1991]. It is worth remembering that econometric exercises have shown no strong correlation between the RER and export growth which in the model has proved much more sensitive to trends in world demand [Rahman 1991]. Thus in 1981-82, when the RER depreciated 9.6 per cent due to a 23 per cent devaluation in the nominal value of the taka, total exports increased by 3 per cent and non-traditional exports not at all. However, in the mid-1980s when RER kept on appreciating total and particularly non-traditional exports such as garments expanded rapidly [Rahman 1991].

IV

Outcome of Reforms

A scientific analysis which is based on a well defined model which causally links the specific policy interventions indicated above with macro- and micro-economic changes in the economy has yet to be designed. For all their enthusiasm about promoting macro-economic reforms the BWI has yet to develop a definitive analytical design to gauge the impact of its policies around the world. The three evaluations they have carried out of their structural adjustment lending programme in the decade of the 80s have serious analytical flaws and suffer from a selective use and interpretation of data [World Bank 1992]. This has been highlighted in a number of powerful critiques of the BWI policies and evaluations [Taylor 1988, Taylor et al 1993, Singh 1993].

As far as Bangladesh goes, the World Bank's work, captured in the annual Country Economic Memorandum prepared for the Bangladesh aid consortium meeting, has been slight in its

analytical rigour. What we are left with is largely some a priori statements of the merits of a policy and an *ex post* review of certain macro-economic data such as GDP growth, investment, exports and inflation rates which establish little causality between policy reforms and their outcomes.

A valuable work at the Bangladesh Institute of Development Studies by Sultan Hafeez Rahman, reviewing Bangladesh's experience with economic stabilisation and adjustment, attempts to review macro-economic performance and goes on to demonstrate that specific policy interventions such as exchange rate adjustments and monetary stabilisation did not yield the predicted results [Rahman 1991]. However this work again suffers from the absence of a holistic analytical model which can trace the interrelations of policies through the macro-economy.

Given these conceptual limitations on an analysis of policy reforms we will in this paper follow the route of the World Bank and other analysts of the economy such as Rahman and the Task Force Report on macro-economic policies and look at certain indicators of performance such as GDP growth, structural change, savings, investment, exports, price stabilisation and the privatisation process during the 1982-92 period to see whether any discernible improvements were registered in the economy compared to the previous decade where reforms were more episodic and limited in their purpose.

MACRO-ECONOMIC PERFORMANCE

In Table 2 we present some of the macro-economic measures of performance of the Bangladesh economy. Growth rates are naturally sensitive to the base year

chosen. For our purposes we review the growth performance of the economy during 1972-75, the three years of recovery in the immediate aftermath of the war of liberation, the period between 1975-81 and then the period of intensive policy reforms from 1982 to the present. We find that the post-war years, notwithstanding the severe socio-political and institutional dislocations of the war and its aftermath, registered a robust GDP growth of 7.1 per cent pa. This in part owes to a low base but indicates that growth trends in this period remained very positive.

The post-recovery phase of 1975-81 broadly coincided with the regime of president Ziaur Rahman, first as martial law administrator and then as president. GDP growth rate in this period averaged 5.1 per cent.

In the period 1982-90, which coincided with the regime of president Ershad, again as martial law administrator and then civilian president, Bangladesh has, since 1982, been exposed to a relentless agenda of donor-supported structural adjustment reforms. In the 1982-90 period, growth averaged 3.1 per cent per year. From March 1991 an elected government came to power. In 1990-91 GDP growth was 3.6 per cent, in 1991-92 it was 3.9 per cent. In 1992-93 a growth of 3.8 per cent is forecast. This suggests that the weak growth trend of the 1980s has not really been corrected. Thus over the full decade of reforms from 1982-92, average GDP growth rates have remained below 4 per cent and thus weaker than in the two regimes of the 1970s. This is surprising if for no other reason than the fact that in the 1972-82 period, the post-war dislocations had been corrected and institutions were more securely established.

TABLE 2: MACRO-ECONOMIC TRENDS IN THE BANGLADESH ECONOMY

	1972-73 to 1974-75	1975-76 to 1980-81	1981-82 to 1989-90	1990-91	1991-92
(1) GDP growth (per cent per annum)	7.1	5.1	3.1	3.6	3.9
	1980-81	1984-85	1989-90	1990-91	1991-92
(2) Invest/GDP (per cent)	15.9	12.8	12.1	10.4	10.3
(3) Savings/GDP (per cent)	3.4	1.9	2.2	3.2	4.5
(4) Rate of inflation (increase over previous year per cent)	12.5	10.9	9.3	8.9	6.2
(5) Sectoral share of GDP (per cent)					
(a) Agriculture	48.8	41.3	38.3	37.6	36.9
(b) Manufacture	10.6	9.9	9.9	9.8	10.1

Policy reforms begun in 1974, accelerated in 1977 and after, were in place, massive aid had been disbursed in support of Bangladesh's development. Thus a comprehensive programme of reform should have yielded quite significant results. What we instead have before us is sluggish economic growth compared to the 1970s and well below growth trends not just in east and south east Asia but even growth registered by our south Asian neighbours.

AGRICULTURAL GROWTH

This weak GDP growth was corroborated by weak growth in the agricultural and manufacturing sector. During the 1970s, agricultural growth averaged 4.2 per cent compared to an average of 1.6 per cent in the 1980s, which was below the population growth rate of 2.4 per cent [Rahman 1991]. Growth in 1989-90, at 7.7 per cent, reflected the recovery from two years of declining agricultural production in 1987-88 and 1988-89 due to floods. But this growth fell to below 2 per cent in 1990-91 and 1991-92. An excellent crop, free of weather hazards in 1992-93, promises a 5.6 per cent growth but this does little to explain the weak and unstable growth of the agricultural sector, interrupted by occasional good years. What is particularly disturbing is the erratic nature of agricultural growth. Between 1981-82 and 1991-92 agricultural growth declined in 6 out of 10 years, was negative in two years and was below the population growth rate in six years.

The weak and unstable growth has been less severe in food crop production because of the use of HYV technology and spread of irrigation. However even this performance has been constrained by the desubsidisation of inputs such as fertiliser and irrigation water needed for HYV technology. This desubsidisation has impacted most severely on the subsistence farmers whose cost of production has increased without compensatory gains from the higher prices available to bigger farmers with a marketable surplus. The rise in input prices has thus become a tax on small farmers which they pay because of their subsistence compulsions. But it has meant that they have not been able to expand input use and hence production to its fullest potential.

TRENDS IN INDUSTRIAL SECTOR

The trends in industrial growth was not much better. However, because of robust growth in the publicly owned utilities sector due to high rates of investment, sectoral growth was stronger. However, if we concentrate on manufacturing, the sector with maximum exposure to policy reforms, including privatisation, we find that in the

1980s, growth averaged 2.5 per cent, well below the rates registered in the 1970s. Growth was quite uneven and heavily weighted by the very robust growth of garments and leather goods. If we look at growth trends in 34 subsectors of manufacturing, we find only six sectors, sugar (public sector), garments (private sector), wooden furniture (private sector), printing and publishing (private), industrial chemicals (private and public) and fertiliser (public) registered any sustained growth. Growth in other sectors was stagnant and showed significant year to year variations.

INVESTMENT AND SAVINGS PERFORMANCE

Weak economic growth is the outcome of both low rates of investment and declining efficiency of investment. We will merely look at investment trends which have registered a steady decline from 15.9 per cent of GDP in 1980-81 to a low of 10.3 per cent in 1991-92. This decline in investment rates has been continuing throughout the period 1982-92. We have already observed the trend of declining public investment which fell from 8.7 per cent in 1980-81 to 4.7 per cent in 1991-92. However, what is even more disturbing is that private investment, which was the targeted beneficiary of the reforms and privatisation programme, fell from 7.2 per cent in 1980-81 to 5.6 per cent in 1991-92. These investment trends indicate that during the high tide of the reforms real investment growth declined in absolute terms in the public sector and was stagnant in the private sector. Indeed levels of private real investment may even have declined in absolute terms.

Low investment rates tend to reflect dismal rates of gross domestic savings (GDS) and weak aid utilisation. GDS remained below 4 per cent throughout the 1980s and in some years was around 2 per cent. In 1991-92 however there is some improvement in the GDS rate. Low savings reflect a weak capacity for domestic resource mobilisation which has been both the cause and effect of high rates of dependence on external resource inflows [Sobhan 1984, 1990]. Low savings rates have transferred the burden of underwriting development on to external resource inflows. However weak utilisation of aid, manifest in low public investment, has kept total investment rates depressed.

EXPORT TRENDS

We have already observed that positive areas of performance have been observed to be in the export sector. Export growth owed to the dramatic escalation in garment exports, which registered substantial creation of new employment, and to a lesser extent in leather and frozen fish.

Total export growth in the 1980s averaged 7.7 per cent of real growth which was double the growth rate in the 1970s. This compensated for the decline in the traditional export sector of jute and jute goods which has become a major casualty of the changing trends in global demand for jute products.

The disturbing feature of Bangladesh's export performance has been the very slow progress in building backward linkages with the domestic textile sector. Investments in the modernisation of the textile industry, which has been in place since the 1930s and upgradation in the product quality of the handloom industry, could have ensured that Bangladesh could have retained around a billion dollars over the last 5/7 years which has gone to pay for imports of all intermediate inputs in the garment industry [Sobhan 1992a].

It has been argued that very little of the growth in garment exports owed to changes in Bangladesh's macro-policies. In fact during the period of maximum growth, the REER was appreciating [Rahman 1991]. The growth originated from the market niche created for low cost garment exports under the Multi Fibre Agreement (MFA). However the response from small/medium entrepreneurs has been impressive and demonstrates that private entrepreneurship has great promise in areas where markets are secure, investment finance needs are modest, technology assimilation is easy and a system of back to back financing of letters of credit provides a ready supply of working capital free of the hassles of import regulation. Thus the garment sector is a demonstration of what some sensible policy support directed to entrepreneurs, dealing within their financial level and managerial competence, can achieve. However, it is arguable that a more purposeful government, such as in the Republic of Korea, would have intervened much more positively to capture the backward linkage effects of the garment exports and would have taken the lead in promoting further exports in such labour intensive areas such as finished leather products and consumer electronics [Rahman 1991].

INFLATION

Another area where reforms may have had same beneficial effect is in the relatively low rates of inflation which averaged around 10 per cent. This has in the last two years fallen to around 5 per cent. Some of this low rate of inflation owes to the weightage of foodgrains in the consumption basket. A long-standing policy of keeping food prices stable has thus contributed to this lowered rate of inflation, particularly in the year 1992-93, where a bumper crop has led to a fall in

foodgrain prices on the open market.

Rahman and Shilpi have estimated an econometric model which indeed suggests that production trends, reinforced by an official policy of foodgrain price stabilisation, has done much more to contain inflation than has the monetary policy of the government. The government has in fact been reasonably conservative in its policy towards monetary growth and has made limited use, during the 1980s, of deficit financing to underwrite public deficits. The availability of aid has in fact made this unnecessary. Indeed the World Bank has in recent years argued for a more adventurous credit policy to stimulate economic activity [World Bank 1993].

The main target of official monetary policy has been to promote private sector activity so that the traditional fears of the private sector being crowded out of the market hardly applies to Bangladesh in the 1980s. The economy has thus remained less exposed to the potential instabilities of an aggressive monetary policy.

Thus whilst money supply (M_2) grew at a rate of 21 per cent between 1981-82 and 1988-89, the inflation rate was 10.8 per cent and GDP growth, 3.20 per cent. This suggests a low and unstable velocity of circulation of money which raises doubts about the causal links between monetary policy and inflation [Rahman 1991].

DEBT CRISIS

Credit policy to the private sector has however been vitiated by the mounting problem of default by the private borrowers from both the nationalised commercial banks (NCB) and the DFIs. The NCB have traditionally been used to underwrite the losses of public enterprises and to promote private economic activity. This has led to politicised lending decisions and lax regulation which has contributed to the accumulation of overdue loans both to the NCB and DFIs. The DFIs were faced with an escalation in default rates where up to 90 per cent of their borrowers remained in arrears of their dues [Sobhan 1991b]. Total recovery rates fell to below 10 per cent of monies due in and led to a suspension of lending by the principal financiers of DFIs, the World Bank, ADB and KfW Bank in 1985 which has had serious consequences for promoting private investment. Currently only a limited amount of external financing is being directed to the private sector through the ADB and the IFC through direct loan and equity support to some private industry. However the very rigorous appraisal procedures and collateral requirements of these loans limits their compass and is no substitute for lending through the DFIs. Private commercial banks and financial institutions have been much more cautious in investments in

ventures and have limited their financing to trade and more secure industries such as garments.

The crisis of the DFIs has extended to the NCBs where escalating overdues have led to the World Bank, through the medium of a Financial Sector Credit package, imposing severe conditionalities for promoting reforms in the Banking sector. This has led to the NCBs being forced to make provisions for overdue loans which has severely eroded their capital base which had to be reinforced with a massive infusion of public money. There has been some improvement in recovery over the last two years but this has not prevented the need for a further recapitalisation of Taka 3.2 billion so as to keep the banks viable [World Bank 1993].

The outcome of this credit crisis has been a severe decline in accommodation to borrowers. Many of the principal defaulters are industrialist so that the stagnation in the industrial sector originates in the unresolved crisis in the financial sector. In the last year the government has registered some 1,500 industries as being 'sick'. This indicates that they need some debt rescheduling and new lines of credit to resume business. The government has advised the commercial banks to deal with these sick industries on a bilateral basis and to accommodate them if they are convinced of their sincerity to repay and the longer term viability of the project. Few Bank managers in the NCBs are willing to risk official sanctions by exercising such discretions to a class of borrowers who have consistently defaulted in their obligations and may default again.

PRIVATISATION POLICIES

The crisis in the financial sector itself originates in the problems of entrepreneurial development which was central to the SA reforms of the World Bank. Under pressure from the World Bank and more recently the ADB, the GOB has since 1977 been pushing credit to the private sector through the DFIs [Sobhan 1991b]. This indiscriminate lending, usually under official patronage, between 1977-82 lay at the root of the default crisis of the 1980s. The absence of a mature entrepreneurial class to avail of this liberal access to public money seems to have escaped the attention of the Bank and the local policymakers who were driven by an a priori belief that unlimited supplies of seasoned entrepreneurs were waiting for infusions of public credit.

A similar form of a priori reasoning thus drove the privatisation policy. This assumed that public enterprises suffered from some form of original sin which made them chronically inefficient and that all private enterprises would invariably establish itself as a more efficient manager of these public assets. The resul-

tant divestiture policy included outright sale under concessional instalment terms to private buyers, denationalisation on favourable terms, to the former Bangladeshi owners of the jute and textile mills nationalised in 1972, and public sale of shares through the stock market of 49 per cent of government equity in particular public industries and banks. The preparatory work of these divestiture exercises was however weak and the oversight of the outcomes of the divestiture process remained negligent.

Up to the beginning of 1991 the GOB had divested itself of about 700 enterprises thereby reducing the share of public enterprises assets from 77 per cent to 43 per cent. However not a single review of the performance of these divested enterprises was attempted. The interim government commissioned a survey of these enterprises which managed in two months to look at 290 enterprises. Of these 53 per cent were seen to have closed down [Sobhan 1992a].

In its latest CEM the World Bank states that of 497 divested units, other than the 62 units of the jute and textile mills, 245 or 49.2 per cent, had closed down [World Bank 1993]. The bank sought to draw some inspiration from the fact that these closed mills were smaller in size. In a survey of 24 closed units in the industrial area in Tejgaon, Dhaka they found that 18 continued to operate but that only eight were operating as industries.

The fact remains that the massive lending and accelerated divestiture to the private sector has not ended in a burst of private investment, improved micro-economic efficiency of enterprises or overall growth of manufacturing output. We have seen the growth figures for manufacturing output and investment in the 1982-92 period, we have seen the massive defaults of the private borrowers to the DFIs and NCB, we have seen the dismal performance record of the divested units and the general state of crisis which has compelled the GOB to declare 1,500 enterprises as officially sick. All this suggests that whatever be the long-term potential of private enterprises in Bangladesh, or the many and continuing weaknesses of the public sector, there are no readymade panaceas in the promotion of the private sector while the entrepreneurial tradition has remained weak.

IMPORT LIBERALISATION

The emphasis on making the private sector more competitive through a policy of indiscriminate import liberalisation is again showing no positive results. The GOB has indeed been quite successful in drastically reducing the number of items covered by quantitative restrictions from about 8,000 or more in 1982 to around 100 items in 1992. Average rates of duty are

down to 25 per cent but in practice they range from 100 per cent to zero. However there is no doubt that imports are more readily available, today in Bangladesh, indeed excessively so because of illegal imports. Thus domestic industries face a much more competitive environment than they did a decade ago which many of them now argue is a major factor in explaining the pervasive sickness of the industrial sector. This suggests that a long period of protected industrial growth, designed to create rents for reinvestment within the industrial sector, may be a critical pre-condition for encouraging first generation industrialists to set the stage for sustained industrial growth. This form of protected industrialisation was certainly the strategy which stimulated industrial growth in Japan, Taiwan, ROK, India, Brazil, Mexico and Turkey, though the east Asians ensured that protecting domestic industry went hand in hand with massive state support for export-oriented industry [Sobhan 1993b, Wade 1990]

Conclusion

Bangladesh's reform programme remains in deep crisis because it has over a decade failed to accelerate growth, diversify the economy, stimulate investment and domestic savings and create the basis for a sustained growth process which can lead to greater self-reliance and substantial reductions in mass poverty. What gains have been registered in the area of improved foodgrain production, the surge in garment exports, the rise in remittances from workers overseas and the dynamism and creativity of some areas of small-scale industry have been largely the result of local initiative aided by favourable market conditions. Indeed crops production has, if anything, been penalised by the desubsidisation policies. It may be convenient for the BWI to blame successive GOBs for their failure to implement reforms and for current regimes to attribute poor results to the malfeasance of their predecessors. But a decade of economic stagnation needs more substantive and a less self-serving diagnosis if Bangladesh is to join the ranks of a resurgent south Asian region, let alone its more dynamic neighbours to the east.

There are obviously no readymade solutions to Bangladesh's problems. What is certain is that rather the simplistic policy agenda originating in the BWI and rather readily embraced by successive governments in Bangladesh now needs more rigorous scrutiny. Such a review must recognise that there are many valuable elements in the BWI proposals which originate from both policy and administrative weakness on the part of the GOB and our entrepreneurs. Many of these reforms in such areas as fiscal policy,

improvement in project implementation and better prioritisation of scarce resources, effective discipline in the banking sector, all merit urgent action by the GOB.

This policy review will however need to look inwards to draw on our strengths and domestic capacities. We will have to see how we can nurse our sick private sector back to health, how to channel resources without inducing similar sickness to the more dynamic components of the private sectors, particularly in the area of small and rural industry. How to stimulate small holder agriculture whilst absorbing the labour of the landless in gainful employment. How to replicate the success stories of the Grameen Bank and other successful non-governmental initiatives within a comprehensive programme to eradicate mass poverty, ensure universal primary education and health care, all within this century. How to diversify our narrow export base and to promote efficient backward linkage which will not prejudice export competitiveness. Above all we will have to make the state more dynamic, responsible and creative rather than as a predatory and inefficient consumer of aid-given resources. This will imply a rethinking rather than a diminution in the role of the state, including ways to improve its macro-economic management capacities, make public enterprises much more commercially motivated and through a planned process of interaction with the private sector.

This process of rethinking will need to be largely endogenous where Bangladesh uses its own expertise to find ways to use its heavily underutilised capacities. Some indication of this potential was captured in the 29 Task Force Reports commissioned by the interim government in office from December 1990 to March 1991 where 255 of the best experts in Bangladesh were commissioned to work on identifying problems and producing policy options for the newly elected government and parliament. This commendable work, done on a voluntary basis, provided a unique demonstration of the enormous potential available in Bangladesh of underutilised human and material capacities to be used more productively. A more endogenous growth process will have a positive impact on poverty alleviation because it is the poor who remain the most creative and productive class in Bangladesh. However there remain many areas in industry infrastructure, human resources, based on sunk investments, many originating in aid programmes, which can be stimulated to contribute to a higher growth rate through more purposeful planning and more sensitively designed policy instruments.

A policy agenda which both targets and empowers the hardworking poor whilst promoting creative entrepreneurship will

thus be the best investment to sustain Bangladesh's still fragile democratic institutions. Our history has shown that the only protection against unconstitutional seizure of power is the unstinted support and public mobilisation of the mass of the population. This can be realised by giving the people of Bangladesh a positive stake in the stability of a dynamic economy based on a much fuller democratisation of economic opportunities [Sobhan 1990a]

INDIRA GANDHI INSTITUTE OF DEVELOPMENT RESEARCH (IGIDR)

FACULTY POSITIONS

Applications are invited

particularly from those interested in policy analysis and applied research for the following posts:

Post	Scale of pay	Gross emoluments at present rate of D.A.	
		Min.	Max.
Senior Professor	5900-200-7600	11,071/-	13,184/-
Professor	5100-150-5700-200-7300	10,271/-	12,707/-
Associate Professor	4500-150-5700-200-6300	8,820/-	11,540/-
Assistant Professor	3700-125-4950-150-5700	7,820/-	10,733/-

In addition, on-campus housing, and other benefits like Contributory Provident Fund, interest-subsidy on housing loans, Leave Travel Assistance, medical facilities, etc., as applicable to all premier institutions are also available.

QUALIFICATIONS :

A Ph.D. in energy issues with excellent academic record Preference will be given to candidates with Electrical and Mechanical Engineering background. Those who have submitted their thesis for Ph.D. but have not yet been awarded the Doctorate, may also apply

Applications with Curriculum Vitae, list of publications, names of references and copies of selected publications should be sent to the Director, Indira Gandhi Institute of Development Research, Gen. Vaidya Marg, Goregaon (East) Bombay 400 065 within one month from the date of this advertisement

Note : Those who have already applied earlier need not apply again

Changing Values in India Today

M N Srinivas

Changes in values and norms are frequently discussed at the individual level and without reference to the wider society of which individuals are members and to the forces operating in the wider society. In this essay the author emphasises some of the changes in the wider society as they are essential to understanding changes in values and attitudes in India today.

I

BEFORE I proceed further, I would like to provide a brief and tentative idea of what I mean by 'values'. I have in mind those ideals of conduct the practice of which is admired by a people. Implicit in such admiration is a recognition that the ideals are difficult to practise, and that those who succeed in doing so are regarded as exceptional individuals, providing models for others to emulate.

However, my aim here is not so much to provide a satisfactory definition of 'values'—that I leave to philosophers—but convey a rough and ready idea of what I mean so that I can proceed with my main task which is to discuss the changes in ideals of conduct (values) which have taken place (and are taking place) in India today.

Values are a difficult subject to discuss with respect to any people but the difficulty increases enormously when dealing with a country as vast, diverse, stratified and complex as India. Values vary from one section of the people to another on the basis of region, language, religion, sect, caste, class and ethnicity. There are also significant differences between villagers and city-dwellers. Indeed, the complexity is so great that one is tempted to abandon the task as hopeless but then valour is sometimes, though very rarely, better than discretion.

Values ought to be distinguished from norms governing actual behaviour.¹ For instance, monogamy is a value for men and women in certain sections of Indian society, and this has to be distinguished from norms which govern the behaviour of husbands and wives. Thus a husband in a traditional marriage is expected to provide for his wife and children while the wife has to cook and serve food and perform other domestic chores. She is also expected to obey her husband who has the right to chastise her when he thinks that her conduct is not 'wifely'. But the norms are not very clear when two educated members of the middle classes get married and both of them are earning.

Even at the level of norms, there is a distinction between what may be called the 'statistical' norms and the 'ideal'

norms. The norm may be mutual sexual fidelity on the part of husband and wife. However, local opinion may recognise that very few men are actually faithful to their wives and breaches of the fidelity norm by men may be viewed leniently while unfaithful wives may be treated harshly. Again, in a stratified society, the fidelity norm may be regarded as more binding in some strata than in others.

While values and norms varied from group to group, the locally dominant caste or other ethnic group provided a model for emulation for the non-dominants. But this operated in a circuitous way. Since the dominant castes were wealthy, powerful and enjoyed high status, lower groups were not permitted to take over their customs, manners and life-styles. Any attempt on their part to emulate the dominants invited punishment but over a long period of time some of the customs and manners of the dominants gradually percolated to the others. Incidentally, since the 1930s the power of the dominants to enforce their will on the others has been eroded due to legislation, education, improved communications and other modernising factors.

However, the dominants were not always Hindus: Jains, Sikhs, Christians and Muslims enjoyed dominance in particular parts of India at different periods of time, and their culture influenced the culture of the area in which they were dominant. Some groups were particularly susceptible to the influence of the dominants: thus some Kayastha groups in parts of north India were influenced strongly by the local Muslim aristocracy, and in south India the culture of the omnivorous, martial Coorgs was influenced by the puritanical, vegetarian and non-martial Lingayat rulers. During colonial rule, however, the better-off Coorgs were influenced by the culture of the British coffee planters in Coorg.

In considering the values, norms and behaviour of people in a country such as India one cannot ignore the influence of the scriptures and the epics. It is possible that the influence of some scriptures such as the *Manudharmashastra* on the conduct of Hindus has been greatly exaggerated, especially by reformers, but that

is no reason for ignoring the influence of the sacred books. The only point is that such influence varies from region to region and group to group, and therefore difficult to generalise. In this connection, the proximity or otherwise of a great temple, monastery, pilgrimage centre, or the capital of the kingdom, radically affected the values and behaviour of the people. For instance, given the lack of roads in pre-British India, people living even 25 miles from the capital of a Hindu king, might be guided entirely by the norms of their caste or tribe unless a great temple or monastery was located close by. At the same time, the popularity of the epics, and of institutions such as *harikatha* (narration of religious tales in prose or verse) helped to spread certain values, norms, ideas and beliefs, of all-India Hinduism among people living in different parts of the country. The two points I have just made run counter to each other but then the inter-play of contrary forces must be accepted as a basic characteristic of the field of our study.

Contrary to popular belief that Indian society is rigid and immutable, it has been subject to continuous change. The fluidity which characterised the pre-British political system, particularly at the lower levels, was a source of dynamism in the sense that dominant castes often acquired political power at local levels and sought to legitimise power by claiming to be Kshatriyas, employing genealogists to provide them with lineages which would be regarded as noble, and through Sanskritising their ritual, custom and life-style. This in turn gave rise to local caste systems which differed in some ways from similar systems elsewhere. (This was specially true of frontier areas.)

While caste has been studied in some depth, the Bhakthi movement, which surfaced in almost all parts of the country though at different times, and which was anti-caste, anti-brahmin, anti-ritual and anti-patriarchal, has not been studied in sufficient depth or seriousness by sociologists. What was the effect of the Bhakthi movement on the caste system and on the ideology of gender relations? Has the Bhakthi movement facilitated the acceptance of human equality? Considering

that the Bhakthi movement goes back to the 7th century AD, even if we ignore the Jain-Buddhist questioning of the pre-eminence of the brahmins, does protest against caste and gender inequalities form a main strand of Indian culture instead of being a marginal phenomenon?

The establishment of British rule resulted in shutting the doors on group mobility through the well-known route of capturing political power at local levels, and the picture of Indian society as extremely rigid, bigoted, divided, and characterised by untouchability, *suttee*, and the inhuman treatment of widows, painted by some British administrators and evangelising missionaries, was accepted by Indian reformers early in the 19th century. This picture continues to persist though recent sociological research pointed out serious shortcomings in it.

Changes in values and norms are frequently discussed at the individual level, and without reference to the wider society of which individuals are members, and to the forces operating in the wider society. In this brief essay, however, some of the changes in the wider society are emphasised as they are essential to understanding changes in values and attitudes in India today. In Section II, I describe briefly a few major changes that were initiated during the early years of Independence and they in turn are responsible for some changes in the values and attitudes of individuals.

II

Soon after Independence the new rulers set themselves the task of producing a Constitution committed to bringing about a change from a caste and feudal society to a 'casteless and classless' society through the means of parliamentary democracy based on adult franchise. This was a revolutionary decision, in particular the introduction of adult franchise, considering the fact that only 16.6 per cent of the population was then literate,² and that over 80 per cent of the people lived in villages which lacked roads, and were isolated, particularly during the rainy season. Unlike other known revolutions in history, the Indian one was slow to pick up, was by and large non-violent till the 1970s when it turned increasingly violent. Violence of all sorts is now widespread, and in some parts of the country, endemic.³

The elite which came to power with Independence wanted the Constitution to bring about fundamental changes in Indian economy, culture and society. The Constitution provided not only a charter for ushering in a revolution but the in-

struments for achieving it. As already mentioned, adult franchise was the principal means for bringing about the revolution, while other measures such as the outlawing of untouchability, and its practice in any form declared a criminal offence, the reservations of seats in legislatures for SCs and STs, and jobs in the government were also important. It must be mentioned, however, that these were intended as temporary measures in order to enable the SCs and STs to catch up with the forward sections of the society. Provision was also made for the states to take steps to advance the interests of the 'socially and educationally backward classes' (SEBC) [also called the 'other backward classes' (OBC)]. The states were asked to prepare lists of such 'classes' on the basis of objective criteria: caste was chosen as a major criterion by several states, on the basis of the level of education of its members, and their representation in the government services, as compared with the average levels for all the castes in the state.

The southern states have been active since the 1920s in the promotion of the welfare of the OBCs and this has resulted in the latter making substantial gains. But states such as West Bengal and Orissa have not even prepared lists of OBCs. The Mandal Commission, established by the Janata government in 1978 to suggest suitable measures for increasing the access of the OBCs all over India to education and employment in the government, recommended, among other things, the reservation of 27 per cent of government jobs, both at the centre and in the states for the OBCs. In August 1990, V P Singh, then prime minister, decided to implement the Mandal recommendation regarding job reservation. This led to violent protests from college students all over the country, many of them committing suicide by setting fire to themselves. There were writ petitions against the government's decision in the Supreme Court. In a recent judgment (November 1992), however, the Supreme Court has upheld the government's decision to reserve 27 per cent of government jobs at the centre and in the states for the OBCs, but they have also imposed a few new conditions.

III

It is indeed impressive that India has been able to practise democracy since 1947 except during the emergency years, 1975-77. The task of holding periodical elections for electorates running into a few hundred millions, is indeed a Himalayan one, and what should be surprising is not that the elections are marred here and

there by violence, booth-capturing, and 'rigging' but that the bulk of the people in this vast, poverty-stricken, backward and hierarchised country should not only practise democracy but make attempts to deepen, and extend and cleanse it.⁴ Democracy enables every tension to surface, and with increasing numbers of hereditary groups competing to obtain access to resources which are getting more scarce, government is continually under such pressure that its survival occasionally appears precarious. But even such a situation is better than that under totalitarian regimes where everything appears smooth on the surface, only to collapse suddenly and irrevocably. Further, democracy is also an invaluable information system in a large, diversified and poor country like India. Democracy is a necessity for India, and it is likely that India's survival as a single entity is due to its adherence to democracy. Contrast in this connection the sudden collapse of countries to its north and west. India's success with democracy is far more relevant for developing countries than its success in the US or UK.

Another achievement is the manner in which India has increased its food production from about 52 million tonnes at the time of Independence to over 170 million tonnes today. Of course, production must continue to increase if the growing population has to be kept fed, let alone a surplus created for export. It is also remarkable that India has not had a famine after Independence whereas China had disastrous famines during the years of the Cultural Revolution (1954-1956) when millions of people died, estimates varying between 16 and 30 million.

As a result of economic development since Independence the proportion of population below the poverty line has come down to about one-third.⁵ But the country is far from abolishing poverty, and from assuring the poorest that their basic needs will be met.

Substantial improvement has occurred in the position of women but it is as yet confined largely to urban middle class women. However, women's movements have gained strength in the last three decades and they are aimed at combating specific evils such as dowry and *suttee* and in achieving eventually gender equality. But I do not discuss it here.

IV

No discussion of changing values can avoid referring to pervasive corruption and violence in political and social life. Corruption has grown phenomenally dur-

ing the last 30 years, and no area of life is free from it. Over the years corruption has come to be accepted as a fact of life, and it is widely known that the citizen has to pay officials, and politicians for permits, licences and other favours. Government officials have to pay bribes, for instance, to be transferred out of a place, or to stay where they are. Transfers appear to be a major source of income for higher officials and their bosses, the ministers. This means that transferable officials must collect enough money in the course of their official work to be able to get or avoid a transfer. The net result is that the citizen is compelled to pay a bribe, for anything he wants from the government. Corruption has penetrated so deep that a former chief minister of Karnataka once remarked that only a powerful social movement could put an end to it. Apart from the *fact* of corruption, there exists a *mythology* of corruption which is even more destructive of public morale; ordinary people talk gaily of chief ministers who made a few hundred crores in the course of two or three years in power.

There has been a tremendous increase in all kinds of violence, organised violence against the state, inter-group violence, intrafamilial violence, and an increase in the general climate of violence, and finally, as in the case of corruption, a tacit acceptance of violence and a growing insensitivity to murder, bloodshed, gang wars and rape.

Some of the violence is directly related to the politico-economic system if it does not stem out of it as, for instance, in 'booth-capturing' during elections.

Since the acquisition of political power opens the doors to wealth, influence and status, all sorts of people including smugglers, black marketeers and mafia dons want to become MLAs and MPs. Political scientists and journalists have written at length about the 'criminalisation of politics' in recent years but nothing has been done so far to tackle it.

Another prime though indirect source of continued violence and frustration is the excessive concentration of power in the centre (union of India) as compared with the constituent states. Such concentration has been compounded by the Planning Commission which has become a powerful arm of the centre allocating resources to the states, and also in monitoring the implementation of the projects it funds. This has resulted in a feeling of helplessness on the part of the people in some states which ultimately leads to violence. The remedy is to give more powers to the states but the centre is dragging its feet on this issue as also on the issue of forming smaller states which will enable some

ethnic groups and areas to shape their own futures. The agitation for the formation of a tribal state, Jharkhand, out of parts of Bihar, West Bengal, Madhya Pradesh and Orissa could have been prevented from assuming the violent forms which it has taken if remedial action had been taken earlier. That smaller states make for greater democracy and better administration, is another argument in their favour.

I do not wish to discuss in detail the phenomenal increase in violence, particularly inter-group violence, since Independence, but would like merely to point out that the abolition of untouchability, punishing its practice in any form, the reservation of seats in legislatures, and jobs in government, and other concessions for the SCs and STs, have angered large numbers of others and, in particular, the rural dominant castes. Clashes between the dominant castes and SCs are frequent and bloody, and are likely to increase with SCs becoming more assertive of their rights.

In urban areas, which are invariably multi-ethnic, economic conflict between groups might assume the form of a struggle between the sons-of-the-soil and 'outsiders', even when the former are only earlier immigrants. This kind of situation is often exacerbated by politicians, businessmen and the film industry, who may use such conflict to further their own ends. The presence of a large number of unemployed, low-skilled and uneducated youth provides the requisite muscle-power to fight the battles of politicians and businessmen.

No account of inter-group violence can afford to ignore clashes between members professing different faiths, which have become frequent in recent years. The causes are many and tangled but an important factor has been the rise, in the post-war world, of religious fundamentalism everywhere, and in particular, in west Asia. In the south Asian region, relations between Hindus and Muslims came under tremendous strain during the closing years of British rule, and the departure of the British was marked by partition of India into Pakistan and India, and by the most violent carnage in the region's history in which nearly half-a-million people were massacred. However, independent India opted for a secular, democratic constitution which guaranteed the protection of the culture, language and religion of the minorities, while Pakistan declared itself as an Islamic republic. But in the last few years India's secularism has come under strain, the Bharatiya Janata Party (BJP) and its allied organisations such as the RSS, Vishwa Hindu Parishad and Bajrang Dal, charging the ruling Congress

Party with practising 'pseudo-secularism' and 'minorityism', to the detriment of the interest of the Hindus who constitute 80 per cent of the population. The recent destruction of the Babri Masjid by the followers of VHP and allied organisations in order to erect a temple to Rama in its place was followed by violent riots all over the country in which over 1,100 people died, and it has greatly exacerbated relations between Hindus and Muslims. The destruction of Hindu and Jain temples and churches in Pakistan, and Hindu temples in Bangladesh, in retaliation to the destruction of the masjid have added fuel to the fire. The net result is that India's political system and social order are facing a severe crisis.⁶

With the rapid spread of dowry among the people, cutting across not only caste, but sect, religion, class and region, intra-familial violence has increased enormously. Harsh economic calculations enter into all traditional marriages, the main aim being to become rich at the expense of the bride's family, and huge sums of cash, gold, and consumer durables being extracted by the groom's family. The size of the dowry has become an indication of the status of the groom's family. Greed and crass materialism mark marriage negotiations and dowry demands often pursue the wretched wife even after she has given birth to one or two children. Many a woman chooses to escape torture and humiliation from her affines by committing suicide by the horrible though well known method of dousing her sari with kerosene and setting fire to herself.

One cannot fail to mention the part played by the media, the films and TV in particular in fomenting a climate of violence. Violence, sex and drugs seem to be the staple of films, both foreign and Indian, and the TV brings all this into the living room. Violence, sex and drugs are now a world-wide problem with the invasion of the skies of the developing countries by Star and cable TV. This is one of the consequences of the world becoming a global village.

V

Since Independence, there has been a visible improvement in the living standards of large numbers of people who eat better, dress better, invest sizeable portions of their income in the education of their children, live in better housing, and spend sizeable sums in buying such consumer durables as refrigerators, TV sets, washing machines, mixies, two wheelers, cars and VCPs. The market for these commodities comprises the middle classes and the top 10 per cent of the population both

together amounting to 340 millions in 1987-88.⁷ It is a huge and growing market, and it is no wonder that multinationals appear to be keen to enter it. It may be noted that buyers of consumer durables are not confined to urban areas, the better-off in rural areas also going in for them. It is not unlikely that the status component in the buying of consumer durables is even higher in villages than in cities, those who own the durables being a small proportion of the local population and the possession of durables being a clear mark of social distance between the haves and have-nots.

Improvements in living standards is usually, if not invariably, followed by an attempt on the part of the upwardly mobile individual to improve the social standing of his family if not of the larger kin-group. A key element in upward mobility is education, for without it good jobs will not be available, living standards cannot be improved, good marriages cannot be contracted, and access to other elements of high status denied. But there is severe competition for obtaining admission to good schools which means, by and large, from the point of view of parents, English-medium schools. (Such preference has also spread to rural areas.) The tremendous demand for admission to good, English-medium schools has led to the latter charging high fees, and in addition, to the payment of sizeable amounts of money as admission fees. The government has no control over private schools in such matters. This practice is confined at present to some parts of the country but all over India urban parents experience acute anxiety over the admission of their children to good schools.

Parental anxiety reaches its apogee, however, at the time of their offspring seeking admission to colleges, in particular to medical, engineering, technical and other professional colleges. The question of admission is further complicated by reserving a proportion of seats to SCs/STs and OBCs. Such reservation is probably highest in Karnataka where not more than 30 per cent of the seats are allotted on the basis of merit as measured by marks obtained at the qualifying examination, and at the entrance test. The net result is that a large number of 'good' students from the 'forward' castes are rejected while those getting lower marks but hailing from the SC/ST and OBC categories obtain admission. This causes much heartburn, and the parents of at least some of these students would try their hardest to obtain seats for their offspring in professional colleges. There is also another and perhaps more prolific source seeking admission to such colleges,

viz., rich and influential parents of mediocre students. What are labelled as 'capitation fee' colleges meet this demand. 'Capitation fee' colleges are Karnataka's contribution to the cause of higher education in India.⁸ The Supreme Court has recently condemned the institution of charging capitation fees for admission but unless the causes underlying the demand for them are removed, I am afraid, they will continue in one form or another. Many politicians have a vested interest in them.

It is well known that many of those who obtain admission have neither the ability nor the interest to pursue exacting courses of professional study even when the institutions are well-equipped and have competent teachers. The question then arises, why do so many parents want to admit their offspring to such tough and demanding courses of study? The apparent answer that the possession of professional degrees provides the road to economic security is not true, for newspapers recently (1992) reported that in Karnataka alone there are over 18,000 unemployed engineering graduates. And there are also dozens of unemployed doctors. But society continues to place a high value on professional education, and a doctor or engineer son fetches a big dowry which not only improves the family's finances but its social standing. In some parts of the country, however, there is a caste component to the demand for professional education; the earlier entrants to professional education were from the higher castes and their success and prosperity stimulated large numbers from the backward classes to emulate them.

It is surprising that parents—I am now thinking of *educated parents*—do not seem to pay any attention to the talents and inclinations of their children in choosing careers. The main motive in choosing a professional career for a son or daughter is to boost the latter's image, and their own, among their relatives, friends and neighbours. The idea that a person should pursue a career which should allow his innate talents to develop so that work not only gives an income but a sense of satisfaction, does not seem to obtain even among the middle classes. A surer and more expensive way of producing educated misfits cannot be imagined and the country has been doing this for over 50 years.

The government of India had a constitutional obligation (Article 45) to make education compulsory for all children in the age group 5-14 within a period of 10 years from 1951, but this has not been met even after 45 years of Independence. Further, the national literacy rate is only 52.11 per cent and there are regions where

literacy, particularly female literacy, is abysmally low. However, paradoxical, as it may seem, higher education continues to be highly subsidised, and there is the proud boast that India is the third largest producer of scientific and technological specialists in the world.

The IITs enjoy great prestige as institutions and they are highly subsidised by the government. Admission to them is eagerly sought after and highly competitive but how many of those who graduate from them stay in India? Indeed, the question needs to be asked, how many of those who benefit from studying in the elite institutions of higher education in India seek careers in the country? Our most successful exports are our best and brightest men and women!

In contrast to Indians who went abroad in the 1940s and 1950s for higher studies, those who go abroad nowadays do not seem to want to return home to seek careers. Excited parents are heard saying, "My son (daughter) does not want to come back. What is there to come back to?" And they are right. Many if not most of our universities and other centres of higher learning have become cockpits for caste, regional and linguistic conflict and intrigue, and both teaching and research are in a deplorable condition. Appointments are made frequently on grounds other than merit. In fact 'merit' has become a dirty word in the lexicon of the advocates of caste quotas and the 'progressives'. There is no surer way of being dubbed a 'reactionary' than by advocating merit as the main criterion in selection to an important post.

Until recently some concern was expressed about 'brain drain' from India to the developed countries, and the need to 'reverse' the flow. But such concern seems to have evaporated quietly, and the expatriates have become NRIs, whose dollars seem to be more important to the country than their skills, qualifications and experience. The irony of this situation seems to be lost on everyone. Greenbacks are preferred to grey cells.

The foreign bug has bitten not only the young but older men and women. Middle-aged Indian women now travel to the US or UK to oversee the pregnancies of their daughters reversing the traditional custom of pregnant daughters going to their natal homes for confinement. Middle-aged women love to talk to their relatives and friends about their stay abroad, the air-conditioned houses and cars, the gadgetry, the glories of the American supermarket, and the conveniences and wealth their offspring command. Back home, the middle class family has shrunk, elderly parents living by themselves and receiving dollar

cheques from their offspring. Very soon it will not be untrue to define an urban middle class family as one which has at least one person earning abroad.

I shall now return to the phenomenon of consumerism, indeed galloping consumerism, for no account of changing values can be complete without reference to it. This is a fairly recent phenomenon but it is making up for lost time by the speed with which it is spreading. Consumerism is heavily dependent on advertising and the advertising business is not only booming, but attracts many talented people. Indian newspapers and journals nowadays regularly bring out lush supplements with multi-coloured illustrations on glossy paper but with hardly any worthwhile reading matter. Looking at them one wonders whether India is a poor country. Advertisements figure on the TV with glamorous film, sports and athletic stars urging the viewer to buy this or that variety of TV set, refrigerator, washing machine, shaving soap, mouthwash, toothpaste, textiles, shoes and so on. It is safe to assume that as far as the TV is concerned, India is only witnessing the beginning of the exposure. TV-watching has become an addiction with large number of people and I learn that even in a remote, small temple town like Melkote (in south Karnataka) over two hundred houses have Star TV and CNN connections. It is alleged that priests hurry through their worship in the temples to go home to watch their favourite programmes!

A distinct teenage culture is emerging, or has already emerged, as a result of the emergence of a sizeable middle class whose youth offer a tempting market for a variety of goods which can be advertised in the newspapers and on the TV. The teenagers are recognisable by their distinctive dress, hair-style, lingo, habits and lifestyle. Their heroes and heroines are usually sportsmen, athletes, film stars, rock musicians, and models. The better-off among them visit pubs, Bangalore being a trend-setter, go disco dancing, and smoke pot. They are more subject to peer group pressures than to family influence. Older people seem to be bewildered at the attitudes and behaviour of their teenage relatives. Or perhaps it would be more accurate to describe the situation as one of 'mutual incomprehension'. There is an urgent need for sociologists to study teenagers in the same way as they study the culture and behaviour of far-away tribes and ethnic groups.

An inevitable consequence of growing consumerism is the pressure to buy goods which are not needed. Housewives and teenagers are likely to feel the pressure

even more than elderly people. Hire purchase schemes, chit funds, the organisation of periodic 'sales' by big firms, and the use of credit cards are an inevitable consequence of consumerism. Having a lot of goods enhances one's status and one is judged by what one has and not by what one is.

When the rich and the middle classes go in for consumerism, the gulf between them and the poor will widen even further. Since the richest villagers are also victims of consumerism, the rich-poor divide will sharpen in rural areas also. Given the tensions which already exist, viz, caste, religion, language, region and low status, consumerism might prove to be the last straw on the backs of the poor. Given an opportunity, the poor might do in Indians cities what the American Blacks did some years ago in Watts and New York. The situations are not all dissimilar.

VI

A major change that has occurred with independence and adult franchise is the emergence of political power as more or less the supreme value for very large number of people. Translating this into traditional terms, it is as though *artha*, the politico-economic realm, has become sovereign, cutting itself loose from *dharma*, the moral realm.⁹ Even within the realm of *artha*, power has emerged as superior to wealth, for power can confer wealth and much else besides. The ease and swiftness with which politicians become extremely wealthy is a very familiar phenomenon. But it is also true that businessmen who are very wealthy can use their wealth to manipulate governmental decisions in their favour. In the process the politician and administrator also benefit, the only ones to lose being the people. That wealth is also used to atone for sins and increase one's stock of merit by doing works of charity and contributing funds to temples, mosques and churches, is the other side of the coin. This idea has not lost its hold, indeed, if anything, the contrary, thanks to the fact that a great many people have had access to wealth in recent years.

But it is important to note that power does not only have an instrumental value but is also endowed with glamour. The trappings and perquisites of power, uniformed sentries, resplendently dressed servants, government cars, telephones, PAs, and the hundreds of favour-seekers who throng the compounds of ministers and the obsequiousness of the favour-seekers, all serve to proclaim the magic of power. No wonder so many people want it.

Finally, power has emerged as the legitimiser of all achievement, and indeed, of all activity, especially public activity. Ministers are asked to open, inaugurate, release, preside over, chair and grace all kinds of functions—sometimes half the cabinet attends a function and those ministers who do not oblige the organisers are dubbed arrogant. How much of his time a minister spends in attending to his ministry's affairs and in attending to the problems of his constituents and how much on ceremonial and public relations exercises is a matter deserving serious examination.

A recent and significant development is the coming together of the politician and the 'renouncer', or man in ochre robes. (The politician is indeed versatile: he moves from the company of criminals of all kinds at one end to that of godmen and sanyasis at the other.) Here, a distinction needs to be made between different kinds of 'renouncers': renouncers who engage themselves in welfare activities, renouncers who are reputed to possess 'powers' to effect cures and perform other miracles, and finally, pure contemplatives (like the late Sri Ramakrishna and Ramana Maharshi). Those who are engaged in welfare activities such as starting schools, colleges, hostels, orphanages, hospitals and old people's homes need to cultivate politicians to obtain grants of land and money, and various kinds of permits, even favours. Politicians know that it is good for their image to be seen close to renouncers, and there is always the hope that at some point closeness might yield votes. 'Godmen' command large followings and their support is not only politically beneficial but provides a shield against the insecurities of the high-risk profession of politics. Finally, the reclusive renouncer is contacted only rarely, for his 'blessings'. It is in the Indian tradition that the temporal realm acknowledges, though only rarely, the supremacy of the spiritual.

An inevitable result of enhanced opportunities for a large number of people and the prevalence of acute competition for obtaining access to resources such as education, employment and a comfortable standard of living is the spread of stress and stress-related ailments among the people. High blood pressure, nervous tension, hyperacidity and insomnia are becoming indicators of middle and upper class status. When neglected they may lead to inefficiency in work, inability to cope with the many demands made on one, and in extreme cases, nervous breakdown. Not only are there not enough psychiatrists to cope with these maladies, but the culture of going to psychiatrists and counsellors

is simply not there. Under these circumstances, prayer and meditation, and visits to temples and pilgrimage-centres offer some relief to people though rationalists may scoff at such practices. People in all walks of life consult astrologers, though it is likely that the middle and upper classes nowadays resort to them more than the others as their lives are coming under increasing strain. (It is not that the lives of the poor are stress-free but they also have their temples, oracles, amulets, exorcists, and holy men.) Incidentally, consulting astrologers is not peculiar to Indians or Asians for that matter. It is prevalent in the west too, the Reagans consulted three astrologers, Princess Diana has an astrologer and we do not know about the other VIPs in the west who consult astrologers.

While consulting astrologers is widespread in India there is a reluctance to acknowledge the fact particularly among the educated. Intellectuals do not hesitate to pour scorn on astrology though it is not certain that they themselves do not consult astrologers when in trouble. Politicians do not have a monopoly of hypocrisy.

To recapitulate, in discussing changing values in India today my approach has been that of an empirically-minded sociologist. But I am also a citizen, and an individual with my own preferences, values, if you like. On the institutional side, I think that people's movements are essential to set right the many ills that infest the body social of which body politic is a vital part. People's movements are indispensable to lessen corruption in Indian public life, to see that development plans do not destroy the environment, to ensure gender equality, to promote decentralisation of power, and to combat growing consumerism. People's movements are needed particularly to teach elected representatives that real power in a democracy rests with the people, and that errant, corrupt or perverse governments will not be tolerated. The tendency to autocracy is so deep at the state and lower levels that periodical elections are not enough to curb autocracy. People's movements might provide the necessary curb but they need time to be built up given the fact that the electorate is poor, uneducated and local leaders are bribable. Perhaps institutions such as recall may be necessary to make leaders more responsive to public opinion.

There is also a need for cutting down the role of the government and to encourage people to develop their own initiatives. To this end voluntary associations need to be encouraged, particularly

in the execution and monitoring of development and welfare work. On the individual plane, there is need to spread the message that happiness consists not in the senseless accumulation of goods which one can do without but in doing work which not only gives money but satisfaction. It is also necessary to realise that those who are gifted have an obligation to use their gifts which they have inherited and which a favourable environment in early years developed, for the good of society, for the benefit of those who are weaker, and not for self-aggrandisement and self-glorification. Gandhi's idea of trusteeship should not be confined to the wealthy but extended to include the gifted.

Notes

[This essay is a revised version of the author's Surya Prakash Memorial Lecture delivered at the Indian Institute of World Culture in Bangalore on September 12, 1992. I thank B V Raman for doing me the honour of inviting me to deliver the lecture. Thanks are also due to V S Parthasarathy for help in the preparation of the lecture and P Ramachandran and R Krishna Chandran who have typed patiently several versions of the lecture. I have also to acknowledge my indebtedness to the National Institute for Advanced Studies, Bangalore, where I am the J R D Tata visiting professor, for providing me with the leisure and freedom to pursue my studies.]

1 "Values are not the same as norms for conduct. Norms are rules for behaving. they say more or less specifically what should or should not be done by particular type of actors in given circumstances. Values are standards of desirability that are more nearly independent of specific situations. The same value may be a point of reference for a great many specific norms; a particular norm may represent the simultaneous application of several separable values. Thus the value premise of 'equality' may enter into norms for relationships between husband and wife, brother and brother, teacher and student, and so on; on the other hand, the norm 'a teacher must not show favouritism in grading' may in a particular instance involve the values of equality, honesty, humanitarianism, and several others. Values, as standards (criteria) for establishing what should be regarded as desirable, provide the grounds for accepting or rejecting particular norms. Thus achievement values, stressing active instrumental accomplishment against a standard of excellence, may be reflected in norms for sports, games, occupational activities, community service, political life, education, science and so on. The same principle holds for values considered as desirable objects or states; for example, a high positive education of 'freedom' or 'authority' may be one of the grounds for a great many specific norms in various areas of society, culture and personality. On the other hand, many norms are multi-valued, relating simultaneously, for ex-

ample to hedonic criteria, considerations of efficiency, and values of social integration. A minor but clear case in point might be norms of etiquette for social dining." (Robin M Williams (Jr), 'Values: The Concept of Values' in *International Encyclopedia of the Social Sciences*, Vol 16, Macmillan and the Free Press, 1968, p 283.)

2 See *Statistical Abstract of India*, 1987, Government of India, Central Statistical Organisation, New Delhi, pp 542-43. The figure 166 literates out of 1,000 is based on figures for India excluding Jammu and Kashmir, and NEFA.

3 See in this connection my *On Living in a Revolution and Other Essays*, Oxford University Press, Delhi, 1992.

4 The Indian parliament has passed two bills, Panchayati Raj and Nagarpalika, providing for decentralisation of power to the people. Two Constitution Amendment Bills, 72nd and 73rd, have been passed, the 72nd Amendment providing for decentralisation of power to the rural areas while the 73rd Amendment provides for decentralisation of power to cities and towns. The bills make it mandatory to hold elections to these local self-governing bodies. See *The Times of India*, December 23 and 24, 1992.

During the last few months, municipal and panchayat elections have been held in the Punjab, with voter turn out exceeding 60 per cent. Elections have also been held successfully in Meghalaya, Nagaland, and most recently, in Tripura.

5 Attention needs to be drawn in this connection to the perceptive statement of M Y Ghoshade, "The poverty line today is defined in a particular way but the nature of poverty has undergone a change and is not so hopeless and helpless as it used to be" ('Whither Economic Policy and Performance?', Rajyotsava Lecture, Institute for Social and Economic Change, Bangalore, November 23, 1992, p 3.)

6 In the modern world, violence within a country is frequently linked to the ramifications of international politics, to religious fundamentalism, to drug-trafficking, mafia dons, and to the existence of close links between all these factors. In this connection see the excellent article of Jasjit Singh, 'Means of Terrorism: From Transistor Bombs to RDX' in *The Times of India*, April 3, 1993.

7 *The Report of the National Council of Applied Economics Research*, New Delhi, quoted in R Venkatachary, 'The Emergence of a New Middle Class' in *The Sunday Times*, November 1, 1992, p 14.

8 See, in this connection, Nupur Basu's article, 'Capitation Fees: Money vs Merit?' in *India Abroad*, August 21, 1992, p 29.

9 *Moksha*, the ultimate value, is far too distant to be able to influence people directly but its indirect influence may be seen in such activities of the elderly as performing daily puja and meditation at home, visiting temples and pilgrimage-centres, performing bhajans, reading religious literature and leading a life-style characterised by attention to things spiritual and indifference to things material.

New Economic Policy and Development of Backward Regions

A Note on Orissa

K R G Nair

This note examines the impact of the government's new economic policy (NEP) on regional economic development with reference to Orissa, one of the least developed states of India. The author discusses the development of the economy of Orissa and brings out the causes of Orissa's relative economic backwardness. The likely impact of the NEP on the development of a less developed region like Orissa is then examined and the main findings are brought together in the concluding part of the note.

THE process of economic development at the national level is seldom regionally balanced. Studies by many, including Williamson (1965), Nair (1982) and Koropecy (1972) have shown that national economic development is usually accompanied by increased inter-regional disparities, at least in the initial stages. The most widely accepted hypothesis regarding the pattern of regional change during the process of national economic development is the concentration-cycle hypothesis according to which regional disparities increase initially to diminish later on as a result, not only of market forces, but also of deliberate policy measures to reduce these, in response to pressures from the less developed regions for such policies. These policies often consist of measures to promote growth in the less developed regions and steps alongside to see that transfer payments to the less developed regions are adequate to ensure that the relative level of living of the people of the region does not fall too low.¹

A country like India, which ranks the 121st in the world in terms of the quality of life that it provides to its people, can ill-afford to allow regional disparities to increase during the course of national economic development.² But there are clear indications in a number of studies, including the ones by Nair (1982) and Dholakia (1985), that regional disparities in India are on the increase. We seem to be at the divergent phase of the concentration-cycle hypothesis. Deliberate policy measures are hence called for, to prevent these disparities from increasing further.

It is also true that India has witnessed a gradual change in its economic policies during the last twelve years, with there being a bunching of such measures in the last two years. As pointed out by Sethi (1992), the clear tendency underlying these is to have greater faith in the efficacy of the market mechanism. In the name of competition, government interventions in the fields of industry and trade are being withdrawn. On the grounds of efficiency in terms of profit maximisation, there is a steady erosion of the commanding heights of the public sector. In fact, many areas, reserved for the public sector, are being thrown open to the private sector, including the MNCs. There are all-round

attempts to reduce government expenditure with a view to reducing the fiscal deficit with the IMF conditionalities and the Dunkel draft more or less definite to be adopted, one can certainly expect more measures along these lines in the next few years.

In the light of all this, it is worth examining the impact of the New Economic Policy (NEP) of the government of India on regional economic development. It is meaningful to do so with particular regions in mind and since Orissa has been found to be one of the least developed states of India, attention is focused here mostly on Orissa. The study here is split into three sections. Section I examines the way the economy of Orissa has developed in comparison to the other states of India; an attempt is also made to bring out the possible causes for Orissa's relative economic backwardness. On the basis of this, an analysis is carried out in detail in Section II of the impact of the NEP on the development of the economy of a less developed region like Orissa. The main findings of the paper are brought together in the concluding part.

I

Orissa's Relative Economic Performance

The relative level of economic development of a state can be judged by the value of the state relative, R_s , in terms of per capita net domestic product (ndp), defined

as $R_s = \frac{Y_s}{Y_n} \times 100$, where Y stands for per

capita ndp and subscripts s and n stand for the state and the nation respectively. Table I gives the values of R_s from 1950-51, the earliest year for which per capita ndp data are available for Orissa to 1987-88, the latest year from the same point of view.³ A comparison between the initial and the terminal years clearly indicates that Orissa has lost its already low relative economic status, considerably over time. To overcome possible criticism that one point comparisons may be misleading, the table also gives the average values of R_s for the quinquennia 1960-65 and 1983-88. These values clearly suggest that the state of Orissa is losing its relative economic status over time, though

the loss is not as pronounced as it appeared on the basis of a point-to-point comparison.

In looking for possible reasons for Orissa becoming a lagging region, it is necessary, at the very outset, to dismiss certain simplistic arguments in this regard. The general refrain of these is that there are certain built-in and immutable factors which would necessarily make Orissa's economy lag far behind the economies of other states. Such a view can, of course, not be based on the absence of natural resource endowments in the state. For one thing, the state has no desert or even semi-desert areas, and has almost double the percentage of area under forest in comparison to that of India as a whole. For another, around 100 per cent of nickel, 90 per cent of chromite, 33 per cent of bauxite and dolomite, 17 per cent of iron ore and 10 per cent of limestone, mined in India in the 80s came from Orissa. Nor would it cut much ice to say that the Oriya has, since times immemorial, been conspicuous for his lack of entrepreneurial acumen. This is apparent if we consider among other things the simple historical fact, pointed out by many including Das (1975), that Kalinga was once a well-developed maritime power having trade relations with many a country in the east.⁴ More recently, Planning Commission (1985) and Reserve Bank of India (RBI) (1984) found, in Orissa, the highest intensity of land use in irrigated area and the highest number of private wells energised per 1,000 hectare of net area sown. In Orissa among all the eastern states considered. The argument that the state, in its present form, came into being only as late as in 1936, cannot hold much water too on this count, if we take into account the fact that states like Kerala and Andhra Pradesh came into being much later. The usual tendency to attribute the woes of Orissa mainly to the weather, gods sending in cyclones and floods, can also not be sustained if we bear in mind that states like Andhra Pradesh and Assam are in no better boats on this count. Sufficient evidence has been produced by many, including Mishra and Singh (1983), to disprove the view that the existence of a large percentage of tribal population cannot, by itself, be considered a major cause for Orissa's relative lack of economic development.

An in-depth analysis of Orissa's econo-

the relative lack of agricultural development which is inhibiting the overall development of Orissa's economy. Orissa is, actually, more predominantly agricultural than the Indian economy. While only 29 per cent of India's net domestic product came from agriculture proper in 1987-88, the corresponding figure for Orissa is as high as 43 per cent. Similarly, while according to the 1981 census data, the percentage of workers engaged in agriculture was 75 per cent in Orissa, it was only 67 per cent in India. A number of studies, including Nair (1982), (1984), Planning Commission (1985) and RBI (1984), have, however, shown that there has been near-deceleration in agriculture in the state, irrespective of whether we consider agriculture as a whole or take into account only rice, the major crop of Orissa, which has 50 per cent of the area under this crop. Between the early 50s and the late 70s, in terms of per capita production of 28 major agricultural crops valued at constant all-India prices, Orissa's rank declined from 4 to 8, with the value of R_i declining from 127 to 100. Of the 14 states considered, Orissa ranked the second lowest from the bottom, experiencing an annual growth rate in y_i of -0.04 per cent. It is of course true that the area under cultivation increased by 1.25 per cent per annum—the increase being the highest among the states of India and double that for India as a whole. But, as pointed out by Sengupta and Sdasyuk in RGCCI (1967), the scope for increase in output through increase in area is limited in Orissa in view of the extremely low percentage of culturable waste—1.6 per cent—as compared to 5.6 per cent for India as a whole. It is thus only through increase in yield that there can be sustained agricultural growth in Orissa and the performance of the state on this count is relatively dismal. The state actually has the lowest yield per hectare of the 14 states considered nor is the picture any different if we consider rice. Both the study by the Planning Commission (1985) and by RBI (1984) show that the share of Orissa in India's rice output declined from 12 per cent in 1952-57 to 7 per cent in 1978-83. Further while Sdasyuk and Sengupta in RGCCI (1967) have stressed the need to increase the yield of rice of Orissa, these studies indicate that the exact reverse seems to have happened between 1971 and 1981 in Orissa.

The reasons for this relatively low level of agricultural development of Orissa in comparison with the other states, are not far to seek. Nair (1984) produced considerable evidence to prove that at the state level in India, value added in agriculture is inversely related to the per cent of small and marginal holdings.⁵ Both the official studies have thrown up evidence that 75 per cent of the operational holdings in Orissa are small and marginal and have also stressed the need for changes in agrarian structure brought about by faithful implementation of land reforms to improve Orissa's agricultural performance.⁶ There is enough factual evidence in these two studies to prove that, besides these institutional impediments, the level of agricultural technology in Orissa, is nothing to write home about

of India in the percentage of area under HYV cereal. The state has an exactly identical relative position if we consider NPK/kg/hectare of gross sown area and this is made worse by the fact that the input-delivery system is almost non-existent in the far-flung tribal areas of the state. There is further evidence to show that the state uses only 28 per cent of its irrigation potential, and 5 per cent of its ground water facility. Moreover, on-farm irrigation in the state is particularly poor due to non-development of canals. On top of it all, many a committee has stressed even earlier the fact that rice is grown in areas like the northern plateau, the central tableland and the eastern ghat region, despite the fact these are not the most suitable areas to grow this crop.

Orissa's relative economic status is no better if we consider the manufacturing sector. Despite deliberate attempts to remove regional disparities in the development of manufacturing industry at least since the 70s, even in 1987-88, the percentage share of registered manufacturing in ndp stood only at 8.4 in Orissa as against 11.7 for India. Actually value added per capita in registered manufacturing in Orissa stood at Rs 93 as against Rs 226 for India.⁷ Detailed analysis of registered manufacturing at the state level by Nair (1984) has revealed relatively high capital—intensity and capital-output ratio for the state indicating the need to bring about better utilisation of capacity in registered manufacturing in the state. As regards unregistered manufacturing, in view of the finding by many including Nair (1982) that development of small industry goes hand in hand with that of agriculture, it is hardly surprising that the relative position of Orissa is worse in this regard. The percentage share of unregistered manufacturing in ndp in Orissa is only 3.1 as against 8.4 for India. Similarly value added per capita in unregistered manufacturing in Orissa was only Rs 36 in 1987-88 as against Rs 162 for India.

II

NEP and Development of Backward Regions

In the light of these findings about the causes of economic backwardness of the less developed regions like Orissa, an attempt is now made to analyse the impact of the NEP on regional economic development. This is done in two stages. Initially, the impact of the policy on primary activities is analysed. An enquiry is then carried out, on the effect of the policy on the manufacturing sector.

As regards agriculture proper, there is no clear evidence of the NEP being beneficial to the less developed regions. Evidence on Orissa clearly suggests the need for land reforms to promote agricultural, and hence, economic, development. Scitovsky (1985) has, in his detailed study, clearly shown that such a view holds true even for the "tigers of the east". Maston and Selden (1992) have indicated the

crucial role of land reforms for poverty removal in areas where agriculture is affected by the vagaries of the weather and Orissa is clearly a typical instance of this kind. But the NEP steers clear of the issue and, to this extent, fails to tackle the problem of the development of the less developed regions. If we go on to consider the other factors affecting agriculture, no clear picture emerges about the possible efficacy of the NEP. The current winds of change indicate considerable reduction in fertiliser subsidies and differential power and interest rates for priority sectors and less developed regions. To the extent that this continues to happen and with the Dunkel draft also likely to be imposed on India, the prospects of increase in fertiliser consumption, irrigation and use of HYV as well as of long-term investment in agriculture, get considerably reduced. On the other hand, with the MNCs entering the fray, the backward linkages of industrial expansion may induce changes in crop-pattern, particularly in favour of inputs for export-oriented industrial activities. It is quite likely that as a result of such tendencies, other primary activities like fisheries and logging, and mining and quarrying, which are already better developed in the state than for India as a whole, may develop even further.⁸ But if all this results in just a considerable increase in the exports of primary products, sustained economic development may not come about in the long run. Actually Harris (1991) in his detailed study of Mexico and Nair (1992) in his comparative study of Bihar and Nova Scotia have clearly shown that export-led economic growth is not sustainable if exports are mainly primary products. Further, it should also not be forgotten that such a tendency may result in the depletion of precious non-renewable resources of the state.

If we examine the impact on industrial development in the less developed regions, the NEP seems to cut both ways and no definite inferences seem possible. There is, of course, a good chance that with privatisation, some inefficient public sector units shed off surplus staff and succeed in bringing about better capacity utilisation. It should also be noted that the NEP has fulfilled a long-standing demand of the less developed, resource-rich regions of India, for the abolition of the freight equalisation policy, which has all along been standing in the way of these states enjoying the comparative advantage due to them as a result of their relatively abundant resource endowments.⁹ All this, coupled with considerable opening up, may help in the setting up of industrial units catering specially to export-oriented activities, particularly in the unregistered manufacturing sector, this being all the more likely if we consider the fact that MNCs usually go in for considerable subcontracting to smaller units. But the NEP has its darker sides too for industrial development. The signing of the Dunkel draft would be the death-knell of many a chemical and pharmaceutical unit in

India. The hike in interest rates is certain to have an unfavourable effect on investment, particularly in sectors with high capital-intensity. Further, the heavy reduction in import duties on capital goods is likely to expose to stringent competition from abroad Indian units, some of which may not yet be ready to face such onslaughts often of limit-pricing. Moreover, with many recent collaborative agreements in the private sector, stipulating the purchase of equipment from specific sources, there are doubts as to whether the most efficient technology would ever get transferred as a result of this wholesale liberalisation. There is also a fear that under the garb of broad-banding, some large units may drive out the already existent tiny and small ones.

III

Main Findings

The analysis here of the impact of the NEP on the development of the economically backward regions of India, with particular reference to Orissa, has brought out a number of relevant issues.

It is clear that from a historical perspective, India has reached a stage, on the basis of internationally observed patterns of regional changes, among others, Williamson (1965), when inter-regional divergence starts generating regional pressures for deliberate policy measures to develop the less economically developed regions. From the political angle too, the time seems ripe for such pressures to become effective, since most of the less developed states, now ruled by parties other than the one at the centre, are likely to raise their voices a little louder at the National Development Council meetings, for special attention to them.¹⁰ But while historically and politically, the time seems opportune for deliberate policy measures to reduce regional disparities, it is a pity that as a result of the NEP, the economic thinking has undergone a volte-face with near-total faith in the efficacy of the market mechanism and with the natural corollary that any interventionist policy is very much frowned upon. But regional development experience the world over clearly indicates that market mechanism *per se* cannot deliver the goods in terms of more regionally balanced economic development.

A detailed study of Orissa has clearly revealed that in regions like Orissa, agri-

cultural development is a *sine qua non* for economic development and that non-implementation of land reforms is a major obstacle in the way of agricultural development. The NEP steers clear of this important issue and the impact of the NEP on the other factors affecting agricultural development seems, on the whole, to go against sustained development of Orissa's economy. As regards industrial development, no definite inferences seem possible since the NEP appears to be a double-edged weapon, cutting both ways on this count. But if international development experience is any guide, mere opening up cannot lead to industrial development of the less developed and predominantly primary-producing regions, and deliberate policy measures are called for to achieve this aim.¹¹

Notes

The author wishes to thank D S Swamy, Ashok Kumar and S S Ahluwalia for discussions while claiming full responsibility for any errors.]

- 1 For a discussion of these policies, see among others, Hansen (1974).
- 2 The ranking is on the basis of an index which combines life expectancy, education and income purchasing power. The index has been brought out by the United Nations in its Human Development Report, 1992.
- 3 For details regarding data see, Nair (1982), from which 1950-51 value has been taken. Data for other years are from Central Statistical Organisation (1991).
- 4 It was so well-developed that it finds a mention even in ancient epics. It is the only place where Indo-Aryan architecture flourished in its purest form. It is also the seat of Brahminic Hinduism.
- 5 Of the ten multiple regression equations tried by Nair (1984) to explain inter-state disparities in value added in agriculture, the best in terms of the value of R^2 and the significance of coefficients is

$$Y_a = 5.04 - 0.27 D_1 - 0.35 T_4$$

$$(8.69) (0.06) (0.07)$$

$$[0.58] [-4.93] [4.88]$$
 where Y_a , D_1 and T_4 stand for value added in agriculture, per cent of small and marginal holdings and cropping intensity respectively. The round and square brackets indicate standard errors and t-values respectively. Both the coefficients are significant at 5 per cent level on the basis of the two-tailed t-test and R^2 equals 0.70, there being no significant correlation between the two independent variables.
- 6 A similar finding also emerges from a detailed districtwise analysis of agricultural productivity in Orissa by Kumar (1992).
- 7 All these are at 1980-81 prices.
- 8 The percentage share in ndp of fishing, forestry and logging and mining and quarrying are 1.8, 2.1 and 3.6 respectively, for Orissa, while the corresponding figures for India are only 0.7, 1.8 and 1.8 respectively, in 1987-88.
- 9 For an excellent exposition of this argument, see, among others, Sinha (1973).
- 10 Formerly, because of the one-party rule all-round and with that party in the past being a simple family-hegemony, the National

Development Council had become a mere rubber-stamp.

11 See, among others, Nair (1992).

Indian Economy at the Crossroads

Manu Shroff

DEEPAK NAYYAR ('Indian Economy at the Crossroads: Illusions and Realities', *EPW*, April 10, 1993) raises a number of issues about the economic policy reforms which require further discussion. Nayyar himself has, with characteristic modesty, described his lecture as providing "a modest beginning for a meaningful debate, which is essential at this critical juncture in our economy". In what follows, I propose to show that the conclusions which Nayyar has drawn do not follow from the evidence he has cited about the impact of the policy reform in India or indeed from the experience of other countries which had embarked on similar reforms. At best, Nayyar succeeds only in pointing to the risks which are inherent in any major and wide-ranging reform. He has, however, been unable to assign any probability to the prospect or failure. And yet all through the lecture there seems to be an implicit assumption that the new policies will fail. Nayyar is careful in his expression of doubt. Each individual remark is made with appropriate caveats. But the overall thrust of the argument is that the country is on the brink of disaster.

His concluding remarks illustrate this point quite well. It is stated:

For the path we have chosen at the crossroads needs careful consideration and substantial correctives. The implications are serious and the consequences may be far-reaching... If things go wrong, we could end up globalising prices without globalising incomes. In the process, a narrow segment of our population may be integrated with the world economy but a large proportion of our population may be marginalised even further. Should this happen, and I sincerely hope that it does not, the grand illusions of a few may indeed be transformed into harsh realities in our society. (Emphasis added.)

What if 'things do not go wrong'? Why is it assumed that the policy-makers will not be able to give "careful consideration" or to adopt "substantial correctives"? The main propositions of Nayyar can be summarised as follows:

- (1) The origin of the 1991 crisis lies in the large and persistent macro-economic imbalances in the 1980s, accentuated by the Gulf crisis.
- (2) The crisis was not due to "misplaced strategy of development" since the mid-50s.
- (3) Government has responded by adopting the strategy of stabilisation, which attacks the demand side of the problem and structural adjustment which aims primarily at the supply side.

- (4) If everything goes right, this will take at least three years to complete. But things are beginning to go wrong.
- (5) The problem of transition arises because the speed of adjustment on the demand side is faster than that on the supply side.
- (6) Stabilisation has not worked: inflation rate, on average basis, has not come down as much as is claimed; balance of payments is no longer precarious but the improvement may not be sustainable in the long run.
- (7) The quality of fiscal adjustment is poor; it squeezes public investment and will hurt medium-term prospects.
- (8) Structural reform is hesitant. No exit policy has yet been formulated. There is inadequate deregulation of the financial sector. Public sector reform has not addressed the problem of productivity and efficiency, etc.
- (9) The assumptions implicit in the strategy are: (i) market mechanism would be a substitute for state intervention; (ii) private investment a substitute for public; (iii) imports of technology are a substitute for domestic technology; and (iv) agriculture does not matter.
- (10) Reform is sustainable only if (a) changes are acceptable to "the polity and society"; and (b) the pace of change can be absorbed by the economy.
- (11) Sequencing could be better. To quote: "In a situation of deep disequilibrium, macro-economic stabilisation and structural reform or adjustment should not be simultaneous events. In my judgment, stabilisation must restore a semblance of equilibrium in the economy before policy reform is used to re-structure the economy."

I propose to deal with each of these propositions *seriatim*. Nayyar (1) is by now generally accepted although one is tempted to recall that not too long ago it was quite fashionable among some economists to argue that a progressive step-up in investment was far more important than macro-balance and that deficit financing had a positive role to play. The author fails to note that the 'profligacy' of government expenditures in the 1980s is a direct descendent of such a belief (which incidentally was associated with the strategy of development adopted in the mid-50s).

Nayyar (2), however, disclaims any connection between the crisis of 1991 and the strategy of planning adopted since the

50s—a strategy which relied on discretionary controls and centralised planning in an economy sheltered from foreign competition and with a large role for the public sector. The disclaimer is not discussed in detail except by way of general comments on the nature of state intervention in economic life. But the conclusion which is drawn there is that 'it is the nature and the form of state intervention that matters'. This is unquestionable. And it is possible to show, as will be done shortly, that that is precisely what the reform is about. There is no warrant for the conclusion, even if it is described as a caricature, that "We appear to have moved from a widespread belief, prevalent in the 1950s, that the state could do nothing wrong to a gathering conviction, fashionable in the 1990s, that the state can do nothing right". What Nayyar has failed to highlight is the gathering conviction that the nature of the state itself has changed a great deal and that it is important, in that context, to plan greater reliance on impersonal market forces rather than on discretionary controls. True, it is necessary to get "state intervention right". It is also important to ensure, through the political process which can itself be generated through economic reform, that the organs of the state function in larger public interest and are not reduced to become the playthings of criminalised politics. The nature and extent of state intervention depends as much on one's perception of the state as on the capability of the market to deliver. The dilemma is acute. But to continue to harp on the state as a major driving force in economic development is to ignore altogether the lessons of Indian political and economic experience since the 1950s.

Nayyar does not argue for reverting to the strategies of the 50s, even though he is not prepared to blame the economic crisis on it. In fact his major criticism of the structural adjustment policies seems to be that they have not gone far enough. This is precisely what Nayyar (8) adds up to.

Coming now to Nayyar (3-6), these propositions point to the beginning of failure of the policy reform. But the evidence is thin. Take the inflation rate. Even on an annual average basis it has come down from 13.7 per cent to 11.5 per cent, based on data up to December cited by Nayyar and to 10 per cent based on trends till March 1993. The detailed analysis of price trends given in the *Economic Survey* for 1992-93 (inflation is analysed up, down and sideways!) leaves little doubt about the deceleration in inflation rate. Is the decline largely due to the good monsoon, as Nayyar argues? The monsoon of 1992-93 was better although the total rainfall received during the south-west monsoon was of the same order as in 1991. Provisional

data show a significant increase in agricultural production and this, no doubt, was a factor in the softening of prices. But a comparison with the experience in previous good years (e.g. 1990-91) shows that demand management has contributed a great deal to the decline in the inflation rate in 1992-93.

Or, take the balance of payments: Nayyar argues that the increase in foreign exchange reserves is due to the once-for-all capital inflows in the form of borrowing from multilateral financial institutions and amnesty schemes and that exports remain sluggish. Maybe the response of exports to the new policies has been slow; but Nayyar carefully avoids mentioning even in passing that the poor overall rate of growth of exports in 1992-93 hides the massive decline of over 60 per cent in exports to the rupee payment area and that exports to the general currency area have gone up by 10.5 per cent in a year in which the world trade increased by only 4 to 4.5 per cent. The increase of 11.5 per cent compares with that of 7.3 per cent in 1991-92 and 11 per cent in 1990-91. Our exports to the general currency area alone are now higher than the total exports in 1988-89 by 28 per cent. (All these figures are in dollar terms.) It is not yet well appreciated that the share of what was once rupee payment area in our exports has now fallen to less than 5 per cent (from 20 per cent only a few years ago). Percentage rates of change in total exports thus do not correctly reflect the contribution that export growth is making to foreign currency earnings.

Nayyar's text was prepared before the Budget for 1993-94. The measures taken since then have further strengthened the prospects for growth. The rupee has held up well after the unification of the exchange rate. When comparison is made with the experience of other countries in the first two years of adjustment, the Indian economy can be said to have come out a lot better.

What is stated above shows that it is premature to think that things are beginning to go wrong. Sure enough, as Nayyar rightly states, it will take at least three years to complete the reforms and many more perhaps to get positive results. Meanwhile the problems of transition are acute and Nayyar (5) is clearly the crux of the problem. In the various scenarios of transition Nayyar describes, he does not take adequate account of the potential of foreign trade coming to our rescue. The comfortable foreign exchange reserves position and the possibility of getting additional capital inflows through foreign equity and borrowing have placed the policy-makers in a good position to counter inflation through imports if need arises (as the government did in 1991 when food imports were authorised). Nayyar's scenarios are all one-sided. There is another side to each of them which would spell reasonable success for the programme.

There is, however, a distinct reason why Nayyar seems to have chosen to describe only the risk and not the potential reward of the reform package. And this comes to the fore in his discussion of the medium-term. Nayyar (7) sums up the main bone of contention. Demand management yes; but not by curtailing investment or expenditure on social infrastructure. The rich are being let off lightly and the poor (who are supposed to benefit from public expenditure on social infrastructure) will suffer. It is implicitly assumed that public investment is the engine of growth. It may have been so in the past, especially during the period when private investment tended to be complementary to public investment. But it need no longer be so. Take power. Does anyone seriously think that the way to relieve the power shortage is through the same route as we have followed in the past—viz, budgetary subventions to highly mismanaged state electricity boards? There is a whole host of issues about the policies necessary to induce massive private investment in the power sector which need to be addressed. Similarly, about social infrastructure, mainly health and education and the anti-poverty programmes. In all these it is more important to improve the efficacy and 'productivity' of public expenditures than to make larger budgetary provisions. In any event the 1993-94 budget has provided some correctives—perhaps too liberally, given the need to keep tight control on aggregate demand. The saving grace is that the bulk of the increase in public investment in 1993-94 will come from the resources to be mobilised by the public enterprises themselves. The fear that this will lead to periodic hikes in the prices of their products is real. But at some point, it will become a self-defeating exercise and they will then have to show real performance to be able to raise resources from the market. But all this is by the way. The main point is that Nayyar (7) represents a stereotype reaction: any growth-oriented policy must be criticised on the ground of its possible failures on the equity front! That complementarity could exist is not recognised, despite the experience of a number of countries, e.g. Malaysia, Indonesia, Thailand and China in reducing the poverty proportions along with growth-oriented policies.

Enough has been said to show that Nayyar (9) is an exaggeration. There are no such implicit assumptions. What is sought to be done is to dismantle the framework of discretionary controls and give a free play both to public and private enterprises. True, neither should have any claim to monopoly barring a few exceptions in the public sector. What is being given up is not faith in the public sector but the reservation of activities for it on purely ideological grounds. Similarly, the reservation of the domestic market for Indian enterprises is also being slowly given up. These propositions are quite different from Nayyar (9).

I shall not comment on issues of technology or agriculture separately. Clearly some policy in regard to each is necessary. But the reform cannot be said to ignore agriculture altogether. Whether it is fiscal policy or foreign trade policy, there are implications for agriculture which have clearly been taken into account and will, as Nayyar points out, have repercussions in agriculture. It is surprising that in the name of promoting productivity in agriculture, Nayyar should be concerned about the reduction in regressive (at least non-progressive) subsidies on fertilisers which make no distinction between the poor and the rich farmers thus resulting in a disproportionate benefit to the rich who no doubt can afford to make much greater use of fertilisers. And having done so, he still talks about the new policies accentuating inequalities in agriculture!

Nayyar (10) is non-controversial except that the context suggests the author's belief that the reforms are not so acceptable. So far at any rate there has been no howl. Almost all the political parties (the CPI-M included) have been against the so-called licence-permit raj. The issues relating to the role of the public sector and foreign investment arouse differences of opinion, but there is a broad consensus that enterprise must be promoted through efficiency-driven means (e.g. competition) and that public enterprises should have much greater autonomy than they have enjoyed in the past. No party wants the economy to be closed to the world, even if each may have its own perception of the pace of change.

Nayyar (11) raises an important issue of sequencing. Unfortunately, the author has not fully argued the case for completion of stabilisation before embarking on structural reforms. He seems to rely primarily on the difficulties that arise due to the multiplicity of objectives and time horizons. He fails to recognise, however, that the slow response on the supply side, observed by him, would argue for the structural changes to have a lead time and thus come ahead of other reforms. Since this is not possible because structural reforms do not seem to work in the absence of macro-economic adjustment, a simultaneous attack on both the fronts becomes necessary. Nayyar's tirade against the multilateral institutions, in this context, seems to be out of place and may well be construed as a cover for the weakness in the case he tries to make for a particular kind of sequencing.

In sum, Nayyar's paper represents a class of economic thinking in the country which might be characterised as ideology-driven pessimism. The proponents of reform need have no illusion that things will always turn out to be right. By the same token, unless one asserts that adjustment necessarily hurts 'the many', the contrast between 'the illusions of a few' and the 'harsh realities for the many' carries little meaning.

There is nothing to hear, speak or think.

It's time to act now

AN ATTRACTIVE OFFER FROM LAN ESEDA

Current Market Price

(Audited for 9 months ended 31.12.91)

Issue of 8,09,02,500 Equity Shares of Rs. 10/- each for cash at a premium of Rs. 15/- per share on Rights basis.

A company which holds investors' interest close to its heart. At LAN ESEDA, we believe that those who have reposed their confidence in us, and have supported us again and again must benefit from our success. No wonder, today over 2,50,000 shareholders are the pride and glory of LAN ESEDA. A base derived from our commitment to achieve and reward.

And now there's more to LAN ESEDA. An import substitute project which will save the country considerable foreign exchange. A project based on the latest improved process from Lurgi GmbH, world leaders in metallurgical technology to manufacture 150,000 TPA of Sponge Iron.

RISK FACTORS AND MANAGEMENT PERCEPTION THEREOF

* Availability of major raw materials: coal, iron ore are based on assurances received from the Government and mine owners respectively. Any short fall would affect the production and consequently the profitability. The management is however confident of making the requisite arrangements for meeting its Raw Material requirements. * Capital cost of the project has been compiled on the basis of exchange rate of foreign currencies ruling at the time of financial appraisal of the project. Although adequate contingency provision has been made in the project cost, escalations on this account in future cannot be contemplated at this stage. * Variation in raw material costs owing to market forces and fiscal changes would affect the profitability of the Company. * An order dated December 23, 1992 was passed by Income Tax Authorities, by which a liability of Rs. 1.58 crores has been estimated. This is being contested by the Company. However, as per the advice received from the Tax Expert, this is neither a contingent liability nor a demand. * During the inspection under Section 209 A of the Companies Act, 1956, Department of Company Affairs has raised certain queries which have been replied to. The queries include irregularities/ violation by the company under Section 372 of the Companies Act, 1956. * The entire cost of project being financed through the proceeds of this issue, there shall be no monitoring from any Bank or Financial Institution. The funds raised would be deployed at the sole discretion of the promoters.

We help Nature keep her true colours.

As reputed manufacturers of vital chemical products, we've been in the forefront of promoting safety and environment protection.

Our commitment to preserve the environment, improve safety and enhance the health and welfare of our employees and the surrounding community manifests itself in every facet of our operations - right from our choice of technology to process selection and engineering design.

Effluent treatment plants at both our factories render liquid wastes harmless. Sophisticated pollution abatement equipment keep emissions within tolerance limits.

Our R&D wing develops products that are environment friendly,

searches for ways to recycle waste and constantly evaluates the effectiveness of our own pollution prevention and control efforts.

We've designed education programmes to inform, train and encourage our employees to actively participate in achieving safety and environmental protection goals; safety inspections and safety audits to assure continuous control; and, onsite and offsite disaster control plans to aid effective response to a wide range of emergencies.

It's all part of our integrated effort to keep our operations safe and harmless.

And to ensure that we help Nature keep her true colours.

Bankrupting the Power Sector

The government's new policies for the power sector will see the power tariff go up by at least three times, the destruction of the country's power equipment industry and a huge drain on the national exchequer.

955

Literacy and Social Change

The literacy campaign, because of its people's movement approach, has enabled the human resources within the folk traditions of the people to acquire a wider regional legitimacy and has provided them a direction through messages of relevant developmental communication. What are the larger implications of the campaign style of cultural mobilisation for literacy in terms of its capacity to create a 'learning society' that would not only sustain and enhance literacy but also ensure more equitable economic entitlements?

981

Sinking Economy

The Russian economy is indisputably in very bad shape. In the western media, Yeltsin's opponents are dubbed as 'hardliners', 'right-wing', 'anti-democratic', 'communists' and 'nationalists' who wish to return to the bad old days of an over-centralised command economy. But what light do the ongoing debates within Russia throw on who are responsible for the economic crisis and their culpability?

995

No Panacea

Different economies with different institutional relationships and varying lines of causality in their economic systems require different approaches to stabilisation and structural reform. A case-by-case approach is required with no preconceived bias in favour of liberalisation.

990

Secular Agenda

In place of the obsessive concern with the communal politics of manifestly communal parties, secular discourse in India today needs to be anchored to the primary concerns of political science around the nature of the state in a plural society and, more specifically, liberal democracy as a structural imperative of India's territorial integrity.

968

Danger Clause

By seeking to hold the accused guilty unless they can prove their innocence in cases of process patents, the Dunkel Draft stands accepted precepts of legal justice and human rights on their head.

958

Health Care

Rural-urban and inter-regional disparities in the provision of health services have not received the attention they deserve in studies on health care planning.

963

Lawless

Most women workers are in the unorganised sector where even such labour laws as exist are not enforced.

962

Crack-Down

The Gujarat government has unleashed a systematic campaign to intimidate and silence the protest movement against the Narmada project.

961

MP for Patna

The people of Patna may finally have their representative in the Lok Sabha after a gap of two years. Always a prestigious seat, the by-election has acquired added significance this time.

959

LETTERS TO EDITOR

Aurangabad Aircrash

THE crash of the IA flight on April 26 in Aurangabad underscores the negligence and callousness with which government utilities are functioning. Aurangabad is an important airport drawing a lot of tourist traffic due to the Ajanta and Ellora caves. It is also an important industrial centre. It is not a tiny, out-of-the-world airport, which should be lacking in infrastructural facilities. Yet, a major accident has taken place.

The fact that the primary cause of the accident has been that the wheels of the aeroplane hit a lorry, which was parked outside on the road near the airport, is indeed preposterous. Why did the plane not rise high enough in the early stages? Why is a 19-year old plane yet in use? Were the engines powerful enough? How was a lorry parked just outside the airport on the road? These are questions which the enquiry will address itself to. But a layman like me is appalled by the fact that a major accident has taken place due to the plane wheels hitting a lorry parked outside an important airport like Aurangabad. The fares of air travel increase every year, but safety norms are being diluted without any regard to passengers' lives.

It is a matter of shame that in our country we treat accidents and safety precautions so callously and cavalierly. We disperse a few lakhs of rupees to the families of those who pass away and close the chapter. The human tragedy and trauma of the survivors and the families of the deceased does not seem to matter at all in our country. I have lost two valued friends and colleagues in this crash.

A number of enquiries take place whenever there is a major air or train accident, but the reports are never made fully available to the public. Moreover, no action seems to be ever taken against those who are responsible for the mishaps. It is time that criminal action is initiated against those who are responsible for neglecting safety norms, etc. For example, in the Aurangabad crash case, the concerned officials who were connected with the take-off of the flight and the persons who designed the airport with the road next to it where the lorry was parked must face criminal charges. People who work for utility departments must be penalised, if they cause any harm to persons due to professional negligence and incompetence.

Moreover, it is also time that the conversations recorded in the black box are made public in future. The public has a right to know the conversations/details of the last few minutes in an aircraft. I was once told by a friend of mine who had heard some of the conversations and recordings that if one hears the discussions taped in the black box, one would

never travel in an aeroplane in India. The public in this country has a right to know all the information pertaining to the accident. This is one of the ways to ensure that those who are in charge of such services handle them professionally.

Movement against Alcohol

ALL liquor shops in Gadchiroli district were closed down on March 29 effectively putting stop to the annual alcohol trade of Rs 200 million. Our first response to the widespread problem of alcoholism in Gadchiroli in 1986, was medical de-addiction. In one year 20 men were de-addicted of whom 15 relapsed into addiction. And there were thousands of addicts in the district. Obviously the medical approach was extremely inadequate. So we decided to turn to the people for a solution. A social model to control the availability and consumption of alcohol in the villages emerged. Very rapidly the small public health work became a massive 'liberation from liquor' movement which, in 1988, placed two demands before the state government: (1) Stop the trade of alcohol in the district by cancelling the licences; (2) Allow the village to control alcohol.

In the last five years 600 villages, 334 organisations and 40,000 people in Gadchiroli district participated in the movement forcing the state government to declare the district dry from October 2 last year. A stay order from the high court prevented the government from implementing the 'prohibition'. But, in a gathering of 10,000 representatives from 300 villages, the movement launched a programme of people's liberation from liquor. In the subsequent six months 200 villages put an effective community ban on the consumption and sale of alcohol using a

wide variety of creative social and political techniques. Thus people have taken control of their lives with regard to an issue they considered very vital.

After a legal battle of six months the high court finally declared the prohibition order valid resulting in closure of the licensed alcohol shops in the district. One goal has been achieved. The movement will now concentrate on the community control of alcohol, on preventive education of individuals vulnerable to alcohol and on providing de-addiction services to the addicts. The movement has already spread to the adjacent Chandrapur district. Women in Andhra Pradesh have successfully forced the state government to declare prohibition. The tide is definitely turning against alcohol in India. This heralds the emergence of a new frontier of public health and action, action against alcohol.

Indigenous Film-Making

WE would like to draw your attention to the Amerindian and Arctic Peoples' Film Project. This collection consists of some 50 outstanding documentaries and feature films, some of which have been made by indigenous film-makers from Latin America and Siberia. We would be pleased if you could draw the attention of your readers to the availability of these films. Obviously the films are of particular interest for programming in the context of the UN Year of the World's Indigenous People. They can also serve as resource materials for educational programmes.

Prejudice to the Fore?

THE government is in for a surprise: the first major initiative for privatisation in the industrial sector—the dismantling of public ownership in the Indian Iron and Steel Company—is proving to be anything but easy. It all started out as an exercise in modernisation. IISCO has been over the years a sick unit, rendered sick by private enterprise which had a long history of being at the receiving end of coddling in the post-independence years by both the authorities in New Delhi and the World Bank. The authorities were finally compelled to take it over from incompetent private management. This major ingot-and-structurals-producing unit could survive in competition, such was then the received wisdom, only if its technology and product-mix were thoroughly overhauled. During Rajiv Gandhi's prime ministerial tenure, even as whiffs of the ideology of globalisation began to drift in, proposals for re-building IISCO with indigenously developed technology began to be spurned. An NRI with Calcutta connections, whose family firm was much in the news in the sixties for reportedly shady deals in iron and steel products following partial decontrol of the pricing and distribution of these items, had for some while held on-and-off discussions on a possible role in IISCO modernisation. He faded away soon, and negotiations were entered into with a Japanese consortium. The deal about to be struck with the latter was the subject of intense criticism at that time. The total package, it was alleged, was excessively high-priced; a public sector bureaucrat, then very high up in the government's advisory hierarchy and of late exposed as a buccaneering participant in the scam, was the patron-saint of the Japanese deal; there was also a story afloat about how Rajiv Gandhi had railroaded the proposal in the cabinet without giving an opportunity to any of his colleagues to raise questions apropos of the soundness of the contract proposed to be signed with the Japanese party. What was noteworthy though was that it was still a programme of modernisation within the ambit of the public sector.

The electoral defeat suffered by the Congress(I) in 1989 led to the death of the proposal for a contractual tie-up with the Japanese consortium. Nothing of significance happened during the very brief Janata interregnum. The issue of IISCO revival has however been back in the news during the past couple of years but with an important shift in the details of the modernisation envisaged. The earlier proposal of linking modernisation with globalisation has not been discarded, but the catalysis is now assumed to take place through a change in equity arrangements: privatisation is the third basic inter-linked item in the agenda. The reason for selecting IISCO, and not any of the Hindustan Steel units which too are not doing particularly well, for the privatisation experiment, is not altogether obscure. IISCO was once in the private sector,

and it was perhaps considered logical to return it to the private sector; the sense of outrage at the mauling of the public sector in steel, once regarded as constituting the centrepiece of the dream of the State occupying the commanding heights of the economy, would thereby be somewhat less strident.

It has not quite worked out that way. An official committee has gone *de novo* into the question of modernising IISCO. It has strongly recommended that Mukand Iron and Steel be entrusted with the job, and, in order to make that possible, the equity of the company be suitably restructured. The committee has claimed to have made its recommendations on severely technical grounds. It is however well known that in the case of committees of this nature, the outcome of the deliberations is a bit of a formality, and it becomes the committee's responsibility to supply the rationale for what the government wants. At the same time, the steel ministry's hands have been strengthened by the reported concurrence of the West Bengal chief minister with the government of India's suggestion to make a gift of IISCO to Mukand.

Irrespective of whether party ideologues do or do not find a place these days in the list of Jyoti Basu's advisers on industrial matters, the Centre of Indian Trade Unions does not obviously relish the prospect of Mukand making an entry at Burnpur. It has taken the lead to gather all the trade union organisations under one umbrella so as to resist attempts to put the imprimatur of approval on the official blueprint for IISCO's privatisation-cum-modernisation. In the view of the trade unions, the issue of modernisation needs to be delinked from the government's overall programme of public sector disinvestment. They are equally determined that the Steel Authority of India be asked to take charge of the IISCO renewal.

It is indeed some sight for the gods, with the government taking the lead to cast doubts on the technical competence of its own baby, SAIL, to assume responsibility for the IISCO modernisation. It cannot however afford to go too far with the demolition of the reputation till now enjoyed by Indian steel technologists. The ministry of steel has therefore found it convenient to pass the buck to the ministry of finance. The immediate allocation of Rs 3,000 crore for IISCO's modernisation and further allocations that would be needed in the Eighth Plan period, the ministry of finance has given its verdict, would not be available from government coffers; it is Mukand or bust.

Left MPs and trade union leaders have discussed the matter with the finance minister, whose response has been remarkably negative: he had no funds to spare during the first phase of the IISCO revival, he could not guarantee allocations in the Eighth Plan either; as regards arranging

accommodation from other sources, he informed the trade union leaders that public financial institutions would not touch IISCO or SAIL with a barge pole, and he, the finance minister, was not going to lobby with them on IISCO's behalf unless it was privatised; if SAIL wanted to post its claim to modernise IISCO, it was free to do so with its own funds.

Several questions arise. If the government does not have the sum of Rs 3,000 crore to spare immediately for IISCO, it is absurd to think that Mukand would possess such funds. Should the latter take over the unit, it would have to raise the necessary resources from the market, and overwhelmingly from the public financial institutions presided over by the ministry of finance. At that stage, the finance minister would obviously put pressure on the institutions to cough up the money Mukand needs. Mukand has till now been a relatively small-time operator in the fabrication of steel semi-structurals, and there is no a priori reason, as far as technical considerations go, for institutions like IDBI or ICICI or LIC or UTI preferring this private concern to SAIL, unless it be for ideological reasons or unless their arms are twisted by the finance minister. Mukand might of course try to raise some funds from external sources; however, foreign parties—including even the World Bank and its affiliates—are usually in the habit of insisting on the country government's guarantee before they would agree to provide accommodation of this nature. Because it is Mukand—a private unit—the finance minister would perhaps be exceedingly happy to furnish the necessary guarantee.

It is thus dogma—epitomising prejudice against the public sector—which is running riot, and not technical concerns. But are the authorities confident of having assessed correctly the ground realities? Are they at all sanguine that they would be able to break the back of workers' resistance to the Mukand take-over? Developments in the coming months will be exceedingly interesting to watch, with World Bank-IMF functionaries breathing down the government's neck and the simultaneous compulsion of keeping organised labour in moderately good humour in view of the near-proximity of democratic elections.

PUBLIC DISTRIBUTION SYSTEM Not for the Poor

IN regard to the public distribution system (PDS) for foodgrains, the government is being pulled in opposite directions. On the one hand, the stabilisation and structural adjustment programmes of the IMF and

the World Bank call for reduction of subsidies, including those on sale of foodgrains through the PDS, as part of fiscal compression. Reduction of budgetary subsidies and winding down of the government's involvement in the purchase and distribution of foodgrains are also being insisted upon by these bodies on ideological grounds. On the other hand, there is the rich and middle peasant lobby whose interest the government has to safeguard for electoral reasons. In fact it would not be far from the truth to say that the principal rationale for the PDS, as far as the government is concerned, is the need to provide price support to this section of farmers through government purchases of foodgrains.

There is more than a touch of make-believe, therefore, about the elaborate concern being exhibited in official circles currently over improved targeting of the PDS. The government has even appointed a committee consisting of the food and civil supplies ministers of three states (Tamil Nadu, West Bengal and Haryana) to examine the issue. According to the Tamil Nadu minister, who heads the committee, almost all the states and union territories, except Kerala and Delhi, were in favour of excluding the well-to-do from the PDS. So it may be presumed that the committee will dutifully accord its approval to some such exclusions in the name of better targeting.

But is so-called targeting the only issue of importance in regard to the PDS? There is no talk now of effective arrangements for active public management of supplies of essential commodities through 'fair price shops' as part of the co-operative network, as had once been suggested by the Mohan Dharja committee. Nothing is also heard any more of using the stocks of foodgrains with the public agencies to generate rural employment through food-for-work programmes.

In the preoccupation with reducing subsidies and further narrowing the coverage of the PDS in the name of better targeting, the critical failure of the PDS to serve as an effective source of food security for the poor has been altogether glossed over. A study by the Public Interest Research Group of Delhi confirms that the focus of the PDS has shifted essentially to providing price incentives to surplus farmers. Repeated and large increases in procurement prices combined with high administrative costs have bloated the food subsidy, despite sizeable increases in issue prices under the PDS. In fact, in many years the issue prices at which grain is supplied to states/union territories for sale through the PDS have been found to be higher than the prevailing wholesale prices.

No criteria seem to have been adopted for allocating grain from the central pool

to the states and union territories. Four states, namely, Kerala, Maharashtra, West Bengal and Tamil Nadu, have been receiving a disproportionate share of PDS supplies in relation to their share in the total population, no doubt reflecting (except in the case of Kerala) the pronounced urban-orientation of the PDS. Available data suggest that nearly 85 per cent of the supplies under PDS go to urban areas which account for about 30 per cent of the population—with the four metropolitan centres and the state capitals appropriating the lion's share. In West Bengal, for example, 80 per cent of PDS supplies go to areas under statutory rationing with 30 per cent of the state's population.

If 'targeting' is to be the objective, then the supplies under the PDS need to be related to the size of the population below the poverty level. The Public Interest Research Group finds, however, that there is no link between the size of the population below the poverty line and supplies under the PDS. Five states where 52 per cent of the country's poor live (Orissa, Uttar Pradesh, Madhya Pradesh, Bihar and Rajasthan) receive only 20 per cent of central foodgrain allocations. An NSSO survey on 'Utilisation of PDS' shows that only 14 per cent of the market-dependent population gets all its supplies of rice from the PDS. The proportion is 26 per cent in the case of wheat. More tellingly, the poorest 20 per cent of rural households get less than 15 per cent of their purchases of foodgrains from the PDS, indicating the limited role of the PDS in augmenting the food intake of the poor.

But expanding the coverage of the PDS to take care of the food needs of the poor, particularly in the rural areas, will not square with the IMF-World Bank imperative of cutting the food subsidy. So the government's committee to improve the targeting of PDS can be depended upon to give the issue as wide a berth as possible.

PSE DISINVESTMENT Grand Clearance Sale

THE government, and the finance minister in particular, have in the past dismissed all criticism that the shares of public sector enterprises had been disposed of at throw away prices. Government spokesmen have been at the same time very coy about disclosing the prices at which the shares had been sold and the modalities followed for arriving at them, in effect expecting their word to be taken on trust. But now we have the report of the Comptroller and Auditor General (CAG) which shows that the government

had been doing not a little lying on this subject and that its critics had been right all along.

In 1991-92 in two phases shares of 31 PSEs had been sold off and the amount realised was Rs 3,038 crore. For 1992-93 a target of raising Rs 3,500 crore through sale of PSE shares was set, but the amount actually realised was only Rs 2,866 crore, once again in two phases. The CAG report deals with the sale of PSE shares in 1991-92. The report brings out a sordid story of shoddy and unprofessional work, manipulation and suppression of facts and utter lack of concern in parting with valuable public assets.

The dubious nature of the whole exercise was evident from the beginning. First, the government approved in November 1991 the offer of shares of 31 selected PSEs in 'bundles' consisting of shares of nine PSEs each (three 'very good', three 'good', and three 'average'). The method was tailor-made for obfuscation, rendering it near-impossible to assess the fairness of the prices offered by the bidders. The bundling provided the cover for disposing of the 'very good' and 'good' shares for a song. The value of each bundle in terms of the reserve price had been kept at around Rs 5 crore, which was apparently not revealed to the financial institutions/mutual funds—a travesty of the tendering process. Valuation by the CAG has now disclosed that, on the basis of reserve prices of shares of selected PSEs, the value of the bundles ranged between Rs 8.61 crore and Rs 12.91 crore. But invitation of bids before fixation of reserve prices of shares resulted in failure to keep the value of each bundle even at Rs 5 crore; the prices offered by the FIs/MFs worked out to an average realisation of Rs 3.50 crore per bundle. Further, the FIs/MFs were offered shares worth Rs 8,000 crore (as per the CAG's evaluation) or Rs 6,000 crore (as per the government's own pricing), though the department of public enterprises (DPE) had known that the FIs/MFs did not possess resources beyond Rs 2,000-Rs 2,500 crore. The result was that there were only 710 bids for 533 bundles for a total value of Rs 2,300.84 crore. The procedure followed also made for absence of competition among the bidders. Thus in the first phase 73 per cent of the bundles on offer had just one bidder and only 4.5 per cent had three or more bidders. In the second phase, there were just one or two bids in 65 per cent of the cases. Among the vastly unequal FIs/MFs, a couple of institutions virtually dictated the prices in both phases.

While deciding to tender the shares in bundles, the government had taken the position that the CCI norms for share valuation (average of the net asset value and profit-earning capacity valued at 15

per cent capitalisation rate with some adjustment for stock market prices) were not acceptable as they would undervalue the PSE shares. Therefore, the average of the two highest out of the following three values was to be taken as the reserve price: (i) net asset value (NAV); (ii) profit-earning capacity value (PECV); and (iii) discounted cash flow (DCF). On opening the bids, it was found that the bid prices were far below the value of the bundles computed with reference to the reserve price worked out as above. The DPE then sought to persuade the government that the highest bids, including single tenders, be accepted so long as they were above the average of NAV and PECV (i.e., the CCI method) with an average capitalisation rate of 10 per cent; further, the prices of the bundles so arrived at would be further reduced by up to 10 per cent if necessary. The CAG has found that the government was persuaded to accept bids substantially below the original reserve prices, the gap ranging between 21.95 per cent and 86.67 per cent, with an average of 64 per cent. In 24 out of 31 PSEs, the reduction in valuation was above 50 per cent. In the fixing of reserve prices for the second tranche, the CAG castigates the ICICI (whose valuation was accepted for 16 PSE shares) for failing to take into account a number of relevant factors in deciding on the valuation of the shares. The ICICI's valuation was much below the reserve prices originally fixed. Though the ICICI loftily decreed that the PSEs' earnings per share and net asset values did not justify higher premia, the CAG has found that the prices actually quoted for PSE shares on the stock exchanges have been much above the average prices realised in the two tranches of disinvestment. The reduction in reserve prices in response to the low bids received in the two tranches resulted in under-realisation to the government to the tune of Rs 3,441.71 crore against the realised amount of Rs 3,038 crore. The CAG has found that for six out of 10 PSEs listed on the stock exchanges, the ruling market prices were higher than even the reserve prices originally fixed under the NAV, PECV and DCF method.

Some of the PSEs like SAIL and IPCL had pleaded with the government against including their shares in the sale at that stage as conditions then were not favourable for them. The government did not heed their pleas and as a result there was gross under-realisation in the case of SAIL and IPCL. SAIL wanted the disinvestment to take place after the decontrol of steel prices had been announced. IPCL had an unduly small equity base and large fresh investment proposals; it therefore wanted to reduce the government shareholding by raising fresh equity from the market directly. When the SAIL share was

listed on the stock exchange, its price reached a high of Rs 240, but the government refused to raise its reserve price beyond Rs 12 in the two tranches of disinvestment. In respect of IPCL, the reserve price was reduced from Rs 175 to Rs 37 and for the second phase it was fixed at Rs 60. Subsequently, IPCL raised Rs 320 crore from the public by sale of fresh equity at a premium of Rs 150 per share, that is, at a price almost three times that realised from the sale of the government's shares.

The CAG report has also brought out that some government officials and the chief executive of a PSE had wanted the incorporation of a 'claw-back' provision for transfer of 90 per cent of the price difference eventually gained by the financial institutions to the government. This was eminently justified since the disinvestment was being done in favour of just a few institutions. But the government would not listen; and the FIs/MFs for their part sold the allotted shares outside the stock exchanges, in violation of the terms and conditions of government disinvestment, but at overall gains to themselves ranging from 127 per cent to 616 per cent.

Finally, the CAG report questions the government's objective in disinvestment of its shares in the PSEs. The declared objectives, as set out in the Industrial Policy Statement as well as in the budget speech of 1991-92, were to raise non-inflationary resources, encourage wider public participation in the PSEs and promote greater accountability. None of these objectives has been achieved in fact. Capital assets belonging to the government have been disposed of to meet revenue expenditure; and the levels of revenue expenditure not having been reduced, the objective of raising non-inflationary resources has not been realised. And contrary to the objective of wide public participation, the shares have been sold to a narrow group of financial institutions. All this is true not only of the disinvestment made in 1991-92, the subject of the CAG's investigation, but also of the sale of PSE shares in 1992-93. And one may be sure that the story of the proposed disinvestment of Rs 3,500 crore in 1993-94 will not be very different either.

STATE FINANCES

One-Sided Appraisals

THE March issue of the RBI *Bulletin* carries the customary annual review of the finances of state governments. The review is based on the picture as it emerged after the state budgets for 1992-93 had been presented. So the lag between the presen-

tation of the state budgets and the RBI's review is of a whole year; slightly more if one allows for the fact that the March *Bulletin* has just become available. By now even the state budgets for 1993-94 have become history.

All the same, the RBI's review should be of great interest in view of the insights one gains of the financial performance of the state governments. But before one refers to the main findings of the review, a general point with analytical implications needs to be raised with regard to the distinction drawn between the states' own receipts and expenditures as distinguished from their total receipts and expenditures, be they on revenue or capital account. Is it correct, for instance, to consider as states' own tax revenues only the revenues they raise from taxes which the Constitution entitles them to levy, excluding the states' share of the central revenues which they are entitled to under the Constitution? The principle underlying the constitutional division of taxing powers between the centre and the states was that even though the centre was being empowered to levy certain taxes the states would have the enshrined right to a share of the proceeds thereof. It is a right they derive from the constitutional scheme and therefore what accrues to them by virtue of this right is as much their own revenue as the revenue the states collect from the taxes they themselves levy. The argument could be extended also to statutory grants by the centre to the states.

The point is important in view of the extravagant claims being increasingly made by the centre with regard to the financial transfers being effected in favour of the states. In the *Economic Survey, 1992-93*, the explanation offered for the sharp increase in the states' combined budgetary deficit from Rs 139 crore in 1990-91 to Rs 1,896 crore in 1991-92 was "the gap between their current revenue and total outlay" in spite of increased transfers from the centre. In fact the *Survey* went on to claim that the increase by 23 per cent between these two years in the current revenues of the states and union territories was "almost entirely due to an increase in grants from the centre and states' share of income tax and union excise duties collected by the centre". In actual fact, as the RBI's review brings out, while the current revenues of the states alone (i.e., excluding union territories) increased by 20 per cent, only 45 per cent of the increase, Rs 5,994 crore out of Rs 13,300 crore, was accounted for by increase in the amount the states received as tax share and grants. All that could really be said was that the increase in total current revenues (20 per cent) was somewhat lower than that in central transfers on current account (22.3 per cent). And the major part of these transfers are of

the statutory type being either tax shares or statutory grants.

As for the general state of the finances of the state governments, the revised estimates for 1991-92 do show a quantum increase in the overall budget deficit from Rs 71.6 crore in 1990-91 to Rs 1,667.1 crore. But as the RBI review points out, with the overdraft regulation scheme being strictly enforced and the ways and means limit of the states adding up to Rs 1,010.8 crore—out of which earlier outstandings have to be subtracted to determine the amount currently available—there is no way the actual figure of the states' overall budget deficit would have come anywhere near the figure of Rs 1,667.1 crore shown in the revised estimates. Of course, the figure could still be higher than the budget deficit of 1990-91, namely, Rs 71.6 crore, and in that sense could be considered a deterioration. But why overstate the case, as the *Economic Survey* does?

It is also noteworthy that according to the RBI's review, while the states' 'own' tax revenues expanded by 15.7 per cent in 1991-92, their 'own' non-tax revenues expanded by 27.2 per cent. The corresponding figures for the centre are certainly higher, being 16.6 per cent and 33.3 per cent respectively, but by no means dramatic (we have to remember all along that to these calculations no deflator has been applied). Interestingly, the *Economic Survey* slurs over the fact that the performance of the states in regard to tax effort is, relatively speaking, very close to that of the centre. But it pointedly mentions that "there was a decline in receipts from land revenue by 6.8 per cent". Did not the authors of the *Survey* know that land revenue accounts for a mere 1.5 per cent of the states' 'own' tax revenues and that its importance as a source of the states' tax revenues had started declining way back, though the decline has been much more sharp since independence?

The important point however is that if a review of states' finances is to be attempted, it should be as balanced as possible. In that sense the RBI review scores over the observations contained in the *Economic Survey*. The states cannot be bamboozled into 'financial consolidation' whatever that term stands for, on the strength of one-sided appraisals of their performance, as the one attempted in the latest *Economic Survey*.

SOUTH AFRICA New Questions

THE violence following the murder of Chris Hani is indicative of the dissonances within the anti-apartheid forces, and also of the growing social and economic stress among the black majority. With the death of Hani, the compromises the ANC and

its allies have to make in favour of the government are becoming increasingly visible. Within the ANC itself there have arisen doubts on numerous issues. Primarily the disenchantment is with president de Klerk's reluctance to set a date for the preliminary elections. The main demand being made now is that a timetable be drawn up for the process towards forming an interim government which will oversee the end of apartheid. Hani's murder signified the coalescing of the Afrikaner opposition which last week issued an ultimatum of sorts to de Klerk: if he went ahead with the negotiations, a separate Boer state would be formed. More than 5,000 farmers pledged to use violence if necessary to achieve their objective. A section of the white population, especially those in the army and the police, appear to support such actions. While at one level this may be dismissed as going against the tide of history and therefore as bound to fail, it threatens to make violence even more a part of the South African scene for many years to come.

There are other issues which are already causing much debate within the ANC and its allies. The South African economy is rapidly going downhill. Predictions for 1993 show a zero growth rate. Many companies, including Volkswagen of South Africa, one of the biggest employers in the eastern Cape region, are envisaging reduction of the workforce which will make it even more difficult for the already impoverished black population to find jobs. And things are not going to be any different in future. Earlier this year the government unveiled its five-year economic plan. It proposes a reduction in state expenditure (including that on the nationalised sector). It also proposes a reduction of corporate taxation and, in a familiar pattern, emphasises the need to strengthen 'savings' as a pre-condition for revival of investment. As an added incentive to increasing investment it proposes that the rise in real wages should not exceed 0.75 per cent. It also reduces import taxes by 9 per cent to encourage imports. The plan has been termed by many as following the classic IMF pattern.

How will the ANC intervene in this economic programme in any power-sharing arrangement with the National Party? The basic demands of ANC's Freedom Charter are hardly going to be met through this programme. The Freedom Charter demands, among other things, massive house-building, strengthening of a non-discriminatory education system and universally accessible health care, all of which will require massive public investment. This issue is being discussed widely within the ANC and among its allies and the debate is bound to raise uncomfortable questions.

Kareems Spun Silk

KAREEMS Spun Silk, incorporated in April 1991, is putting up a 100 per cent EOU at Devanahalli, near Bangalore, for manufacture of spun silk yarn with a capacity of 100 tonnes per annum. It is to be assured of raw material silk tops which the promoting company, Kareems Silk International (KSIL), is supplying to cover the requirement of 120 tonnes a year plant for value addition by a four-stage process—preparatory, spinning, twisting and finishing—in production of spun silk yarn. Full capacity production of KSSL will be lifted by the already established network of buyers of KSIL around the world. Abdul Samad, the man behind KSIL and KSSL and having 40 years' experience in silk and related products, established Kareem Cascami in 1979 as a joint venture with Cascami-1872 of Italy, which became Kareem's Silk International when the collaboration ended in 1985. KSIL itself is a 100 per cent EOU manufacturing silk tops and noils at Nanjangud in Karnataka. Spun silk yarn is used in the manufacture of fabrics, carpets, etc, and has a wide market potential internationally. With KSIL's established global market, capacity production is envisaged right from the beginning for KSSL. The project has been appraised by ICICI to cost Rs 1,200 lakh, which is to be financed with equity Rs 650 lakh (promoters—Indian Rs 220 lakh and NRI Rs 80 lakh) and public Rs 350 lakh and loans of Rs 550 lakh. A major part of plant and machinery is being imported from M T Consult, Italy. Barchiesi Lamberto from Italy, a technologist of 40 years' standing in the international spun silk industry, is associated as a consultant assisting in the project from the selection of machinery, installation and commissioning and ensuring quality of production. The public issue of 35 lakh equity shares of Rs 10 each at par aggregating Rs 350 lakh opens on May 17. ICICI and SBI caps are the lead managers of the issue.

Kothari Sugars and Chemicals

Kothari Sugars and Chemicals which has been diversifying rapidly into petrochemicals over the last three to four years, with units for the manufacture of polybutene at Manali and PNCB/ONCB at Karaikal having been established, will shortly be commencing commercial pro-

duction at its new distillery at Kattur in Trichy district. Work is also progressing at a rapid pace on the expansion/diversification projects at the petrochemical units. On a turnover of Rs 65 crore, the EPS on the enhanced capital of Rs 9.79 crore is projected at over Rs 4.50, for the year ended March 31, 1993. The sugar unit at Kattur has been in the forefront in performance among sugar factories in the country. For the last three years, it has been among the top two sugar units in Tamil Nadu, in terms of efficiency. In the 1991-92 season, it crushed a total of 5.3 lakh tonnes of cane at a recovery of 10.13 per cent. In the 1992-93 season, it is expected to crush a minimum of 4.6 lakh tonnes at a recovery of 10.1 per cent. The capacity utilisation will be 120 per cent. Almost 20,000 tonnes of sugar from this unit have been exported in 1992, which is among the largest quantities exported from a single sugar factory during the year. The decontrol now of molasses and industrial alcohol will give the company an advantage in production and distribution of industrial alcohol. The polybutene unit at Manali, Madras, has achieved more than 100 per cent capacity utilisation during the year. In addition to the normal lube oil additive market, several new markets have been opened up, thereby contributing to significant in-

creases in volumes of sales. A large quantity of polybutene has also been exported to south-east Asia, Australia and Europe. The product has been accepted as comparable to the best in the world. The PNCB/ONCB plant at Karaikal in Pondicherry has also worked to a high level of capacity during 1992-93. Exports of nitrochlorobenzene have already commenced to south-east Asian countries and it is anticipated that the export front will be opened up even more significantly. Erection of a distillery for production of industrial alcohol with captive use of the molasses produced at the sugar unit is almost complete. KSSL has a licence for manufacture of 90 lakh litres of industrial alcohol and the distillery is expected to go into commercial production at any time now. The company has plans to diversify further downstream into alcohol-based chemicals at the appropriate time. Facilities are being established at the polybutene plant at Manali for manufacture of leather chemicals and cable jellies based on polybutene. Tamil Nadu is virtually the home of leather, and KSSL has been successful in developing a range of leather chemicals based on polybutenes, in collaboration with the Central Leather Research Institute. Cable jellies and cable compounds serve the needs of telecommunication cables. Pro-

SOUTH ASIA IN A CHANGING INTERNATIONAL ORDER

GOWHER RIZVI

The central purpose of this timely book is to examine the consequences, for South Asia, of recent changes in the international system. The author covers a vast canvas but focuses on three main themes: the impact of the disengagement of extra-regional powers on both inter-state and intra-state conflicts in South Asia; the implications for the economies of South Asian states of the creation of an integrated European market; and the increasing marginalisation of South Asia in the post-Cold War order.

194 pages • Rs 200 (cloth) • Rs 100 (paper) • 1993

SAGE PUBLICATIONS INDIA PRIVATE LIMITED

Post Box 4215, New Delhi 110 048

duction at Manali is likely to be expanded to 7,500 tonnes per annum from the current level of 5,000 tonnes. This expanded production will be entirely consumed captive. KSCL is setting up facilities at Karaikal for the manufacture of downstream products from PNCB/ONCB and dichlorobenzene. The products being proposed to be manufactured are in the area of dye and pesticide intermediates. This will result in captive consumption of approximately 2,000 tonnes of PNCB/ONCB. KSCL will cross Rs 100 crore turnover in 1993-94 and with the full functioning of all the units, the EPS should move to over Rs 8 on the expanded capital. To part finance the aforementioned plans the company proposes to issue capital of around Rs 23 crore. This will comprise 48,95,475 equity shares of Rs 10 each at a premium of Rs 35 per share on rights basis to shareholders; and 2,44,774 equity shares of Rs 10 each at a premium of Rs 35 per share to employees of the company and group companies. The issue has opened on April 30 and closes on May 31.

Dharnendra Agro Food

Dharnendra Agro Food Industries, promoted by Fly-up Fashions of the Dharnen-

dra group of Navinchandra B Gandhi, is coming to the capital market with an issue of equity shares which opens on May 25 under IFCI and PNB Caps as lead managers. The company is issuing in all 96.90 lakh equity shares of Rs 10 each at par, raising its share capital thereby from Rs 97 lakh at present to Rs 10.66 crore. It is offering to the public 47.45 lakh equity shares and another 20 lakh shares to the NRIs. Dharnendra Agro Food is establishing a project for export of 3,000 tonnes of tomato paste and puree, 1,000 tonnes of mango pulp and 2,000 tonnes of dehydrated vegetables. It has signed an MoU with a merchant exporter in Dubai for export of these products in the international markets. The project is appraised by IFCI to cost Rs 12.16 crore. Finance of Rs 10.66 crore is being covered with equity share capital and the balance of Rs 1.25 crore is to be secured by lease finance. The project is slated for commercial production in September 1993. IFCI has projected at 60 per cent capacity utilisation a turnover of Rs 24.75 crore for 1994 and a net profit of Rs 2.40 crore, yielding EPS of Rs 2.24. Two years later, in 1996, the turnover is expected to reach Rs 33 crore with net profit estimated at Rs 2.87 crore and EPS at Rs 2.69.

—JK

COMPANIES

For Whose Benefit?

Jeiraj Kapadia

THE obligation to pass on the fresh concessions in excise and customs duties to industries which were announced in the union budget before it was passed by parliament on May 5 is to be that of individual companies. However, as the concessions were declared to meet recessionary conditions, the finance minister told industries to hand the reliefs down and not to keep them to themselves, warning that failing that the government would be forced to withdraw them. Whether such a warning is to stand in a relative free market regime now is open to question. But the onus in this case is to be that of the chambers of trade and industries and respective associations of industries. These might as well now see to it that their constituents face up to the responsibility. Will the representative bodies like the IMC, the ASSOCHAM, the FICCI and the chambers of commerce and of industries rise to the occasion? The question begs attention, as the experience in the market in respect of the duty reliefs declared in the budget presented on February 27 has not been encouraging.

Stores in Bombay (leave alone in smaller towns and places in the interior) present

quite a discouraging situation. The storekeeper has either no goods to offer as he is still expecting stocks at post-budget revised and reduced prices because of the lower duties to arrive from the manufacturing companies, or has products for sale at earlier pre-budget prices. If it is taking companies' time to roll out the products, it is precisely because the union budget contained duty concessions which were expected. Compare the present situation with earlier experience. Because the budgets then effected duty hikes, goods used to go off the shelves in the stores before the budget, only to be recycled at increased prices in no time after the budget. Now earlier stocks are there on the shelves at pre-budget prices while the manufacturers are taking their time to supply fresh stocks at revised prices.

The case is, no doubt, different in industrial products, as industries will comply among them. But the consumer remains a sufferer. How long the companies might take to follow through with the reliefs is anybody's guess.

MCLEOD RUSSEL

Higher Tea Exports

For McLeod Russel (India) the financial year ended March 31, 1992 has proved fairly normal with quality teas on sustained demand displaying firm prices, although average prices were lower than in the previous year in both domestic and international markets. However, with the rupee's devaluation followed by partial convertibility last year and now a unified exchange rate this year, exports are likely to go up. Total exports during the year amounted to Rs 1,747.81 lakh on fob basis, representing an increase over the previous year by 22.56 per cent. The company has continued to maintain its thrust in quality tea exports, keeping its market share abroad in spite of stiff competition from other producing countries. Efforts for a further increase are continuing with available benefits of excise duty rebate and tax exemption on export earnings and it is expected they will result in further improvement in the volume of exports.

Cost increases and particularly increased labour expenses have affected profits which at operating level itself have registered a decline from Rs 2,501 lakh to Rs 2,266 lakh. Gross profit as a ratio to sales has also dropped two percentage points from 28.70 to 26.41. Revaluation of fixed assets has been an important feature of the finances, since due to this the financial ratios have recorded a sharp deviation in comparison with the previous year's figures. The revaluation at March 31, 1992 is made on current cost basis, resulting in an incremental amount of the order of Rs 1,46,64,16,284 in block account as well as in reserves and surplus with a revaluation reserve created of a like amount. As the revalued amounts of the assets are pertaining to the year-end position, depreciation is charged in their respect in accordance with the rates as per the basis hitherto followed by the company. Further, additions were made to the block account of Rs 554 lakh, while assets of Rs 38 lakh value were disposed of. The figure of revaluation being substantial, turnover ratio, return on investment and return on equity have all recorded sharp declines.

MOHAN MEAKIN

Growing Competition

Liquor consumption is no doubt rising, but liquor producing companies are having no cakewalk. With their growing ranks they are resorting to quite a few stratagems to boost sales even at the risk of taking a cut in profits. The directors of the liquor company, Mohan Meakin, make a pointed reference to this prevailing situation in their report to the shareholders for the year ended March 31, 1992. The directors state: "The liquor trade is becoming very competitive

day by day and your company is also getting geared up to meet the market challenge. The profitability of the company [during the year] has been affected because of higher inputs in the marketing of the products on account of rebates and incentives; otherwise the turnover would also have registered a decline."

In the light of the foregoing, one is not quite sure whether the rise of 18 per cent in sales recorded in the first quarter of 1992-93 would be resulting in an improvement in profitability of the company. The directors explain that the increase was due to "extensive market efforts" to beat stiff competition from other companies. The directors expect, nevertheless, that the measures taken by the company would bring in the desired results, barring unforeseen circumstances.

During the year 1991-92, the company made purchases of finished goods of an amount of Rs 1,707 lakh compared to Rs 1,632 lakh in the previous year. Beer production increased from 20,483 kl to 22,078 kl and so also of spirits from 1,36,20,305 lpl to 1,52,55,425 lpl. Gross sales rose from

Rs 114 crore to Rs 129 crore. But as profits worked out less, the dividend to shareholders was curtailed from 15 per cent to 10 per cent.

SUPREME INDUSTRIES A Landmark Year

For the first six months of the financial year ending June 30, 1993, Supreme Industries has reported further increases in sales as well as in gross profit. Compared with the corresponding period of the previous year sales worked out more by 2.9 per cent at Rs 80.40 crore and gross profit by 8.9 per cent at Rs 6.80 crore. As the full year's results fall due for announcement later, in all probability the company would have charted still further growth. Yet it is the year ended June 30, 1992 that was memorable for Supreme Industries. For one thing, it was the golden jubilee year of the company. As a landmark year it earned the shareholders an additional 15 per cent dividend while the aggregate dividend of 75 per cent was declared *pro rata* on additional 11,96,006 equity shares of Rs 10 each which

were issued at a premium of Rs 90 per share on conversion of partially convertible debentures. That was not all, as the shareholders were rewarded further with a proposal of a 1:1 bonus issue by the directors.

The bonus issue made at the close of the year was backed up with an offer of 1:10 rights shares to shareholders at Rs 240 premium and a further issue of partly convertible debentures of the face value of Rs 450, Rs 200 of which being the convertible portion into equity at Rs 190 premium. These issues were proposed at the AGM held on September 16, 1992, when the shareholders were also called upon to approve of a resolution to authorise the directors to raise for the company borrowings up to Rs 300 crore.

The expansion/investment programme and increase in long-term working capital requirements, to be met by end 1993, were reckoned at about Rs 115 crore. The same is proposed to be financed with the proposed rights issues of equity shares and PCDs to the extent respectively of Rs 17.99 crore and Rs 80.96 crore aggregating to Rs 98.95 crore and the balance amount of Rs 16.05 crore with internal accruals. The rights issues are to accommodate various proposals: one, increase in capacity of injection moulding, flexible films and PVC pipes at all the locations; two, launching of polystyrene foam and thermo-formed polystyrene products at Gwalior and Daman, respectively; three, establishment of new air bubble film manufacturing facility at Gwalior; and four, merger of A K Structural Foam having structural foam injection moulding facility and acquisition of an existing unit with facility to manufacture flexible packaging material.

Meanwhile, during 1991-92, Rs 16.37 crore was invested in programmes of modernisation, expansion and diversification, while together with capital work-in-progress, the total figure of investment made amounted to Rs 21.28 crore. This has enabled the company to start its manufacturing facilities at Daman and Pondicherry. It has also increased the product range at Noida and increased capacity and range of pipes and fittings at Jalgaon. In injection moulding division, located at Andheri (Bombay), Noida and Pondicherry, from industrial components the company is switching in favour of consumer durable products, having reduced the extent of the former already from 81 per cent to 63 per cent during the year and intending to bring it down further to 50 per cent in 1992-93. Yet another injection moulding unit is being put up in the east, near Calcutta, thereby covering all the four directions. The MLS division catering to the refrigerator industry was fully stabilised during the year, while the technology centre entered the export market with export of tools. Products worth Rs 2.23 crore were exported as against Rs 49.28 lakh in the previous year. The company expects to increase exports substantially. However, the amount of foreign exchange expended was much more at Rs 43.19 crore.

New Power Policy: Bankrupting the Power Sector

P Purakayastha

The new power policy will see the power tariff going up by at least three times, the destruction of the country's power equipment sector and a future drain on the national exchequer of huge amounts. To those who wear ideological blinkers all this means little. The selling of India piecemeal is the game and it matters little if future generations pay a heavy price for the activities of today's carpetbaggers.

THE future of the power sector in India appears rather bleak. A cursory review will show that organisations and companies connected to the power sector are in various stages of bankruptcy. The government of India has of course found the usual solution—invite capital, both foreign and Indian, and all will be well. However, it needs to be examined whether the proposed solution will lead to the long-term health of the power sector or it will be worse than the disease. A simple calculation shows that the measures proposed by the Department of Power will result in an additional loss of about Rs 10,000 to Rs 15,000 crore to the State Electricity Boards (SEBs). Even if the power tariffs are hiked to three times their current levels, the SEBs will still incur a net loss for each unit of electricity that they will buy from these power companies. If the lack of investible resources with the SEBs is the crisis in the power sector, the measures proposed to be taken by the Department of Power are a sure recipe for disaster.

The Eighth Plan envisages a net addition to the Indian grid of 38,000 MWs out of which 28,000 MWs are to be met from state's internal resources and 10,000 MWs from private and foreign investments. The Department of Power has offered for such investments 78 such projects with an aggregate capacity of approximately 21,500 MWs, presumably including a part of the Ninth Plan targets. Offers have been received for 41 of such projects.¹ However, looking at the current investments being made, the promised state resource mobilisation for the 28,000 MWs does not seem to be forthcoming. Perhaps if large-scale capital inflows can be found from private or foreign sources, much more than the estimated 10,000 MWs will be handed over. However, for the purpose of calculations here, private or foreign generation of only 10,000 MWs as plan-

ned initially by Department of Power has been considered. If the possibility of an even larger slice of the power sector being handed over is taken into account, the scenario is even gloomier.

REMEDY WORSE THAN DISEASE

For making power generation attractive to foreign capital, there are a number of commitments that the government of India has made. The key commitments are a minimum guaranteed 16 per cent rate of return on equity² based on hard currency and a cost-plus calculation for the electricity produced. The SEBs will have to enter into long-term contracts to ensure the above payments, which will be backed up by sovereign guarantees from the government of India. The SEBs will also guarantee minimum off-take of 60 per cent for such plants.

The proposals available with the government for various projects clearly show that the cost per MW in terms of investments is of the order of Rs 4 crore per MW. The total foreign or private investment being sought is therefore of the order of Rs 40,000 crore for 10,000 MWs. If the above returns are to be guaranteed, the SEBs who are the distributing agencies will have to realise the revenue from the sale of the electricity. Therefore, it is worthwhile examining the cost of such electricity as against current generating costs and the additional losses the SEBs will incur if the current power tariffs are maintained.

The detailed calculations of the costs of such power have been worked by K Vijaychandran in his report on the Indian Power Sector, a study jointly sponsored by an Apex Committee of Officers' Associations and Trade Unions in the Power Sector.³ Roughly, these calculations show that per MW of such contracted power, the SEBs will have to pay

Rs 5 per unit as against the current cost of generation per unit of Rs 1.05 and their current realisation of 81 paise. The calculations have assumed a debt-equity ratio of unity. Even if 4:1 debt-equity ratio is assumed, the SEBs will have to shell out nearly Rs 3.50 per unit (see table) for coal-based plants. If no tariff changes take place, the loss to the SEBs on account of paying for such power will be nearly equal to the total revenue being earned by the SEBs today. The SEBs will have to suffer an additional loss of Rs 10,000 to Rs 15,000 crore per year and this for an additional installed capacity of a mere 8 per cent (Eighth Plan-end as the base).

The other alternative for the SEBs will be to hike the tariff rate massively to offset this loss. Currently, the SEBs are in the red to the tune of Rs 4,300 crore in accumulated losses and owe Coal India and NTPC almost similar amounts. If we do not take into account the past losses and look only at the current realisation as against current costs, the SEBs are losing approximately 24 paise per unit as against a cost of Rs 1.05 per unit, a loss of 30 per cent in current revenue terms. To offset the huge amounts that would have to be paid to the proposed power companies, a simple back of the envelope calculation would show that the tariffs will have to be revised not by 30 or 40 per cent but by 300 per cent. Even after such revisions, the SEBs will be paying more to the proposed power companies than their selling price to the consumers. The loss due to such power will come down if tariffs are hiked steeply, but would still constitute a serious drain. Thus the SEBs will continue to be in the red even after a three-fold rise in the cost of electricity.

The problem of the Indian power sector does not lie in a temporary resource crunch. A temporary capital shortage can be made good by borrowings or inviting private and foreign capital. As long as the power produced can be sold at a profit, the decision to adopt this path is at least financially viable. But what happens if the power produced in this way has to be sold at a loss? The costly power from the proposed investments is going to land the power sector with a perpetual loss of enormous proportions which will have to be made good by the cheaper power produced by the much reviled SEBs. In fact, in this case, the suggested cure is much worse than the disease.

LIQUIDATING BHEL

Why is the government embarking on a path which is sure to spell disaster? The first and foremost reason perhaps is that

the global power equipment manufacturers are bringing enormous pressures through IMF and World Bank to open up the Indian power sector to import of power equipment. The world power market, particularly in advanced countries, is totally depressed as their power consumption has remained static or have actually come down in the last decades. With no new investments coming in the home countries, the power equipment MNCs are looking to external markets. However, the existence of an indigenous power industry has meant that the equipment costs are much lower in India than in the west. Therefore, the only way that power equipment can come from the MNCs is through tied credit and equity participation. It is important to note that in tied credit, even if cheaper equipment is available locally, purchases have to be made according to the choice of the financiers. The initial global competitive bidding itself had pushed up domestic power equipment costs. In order to compete, the domestic suppliers had to meet the specifications framed according to World Bank approvals and this did see a substantial rise in costs. However, in spite of this, domestic equipment manufacturers have been able to maintain a clear price advantage and have bagged most of the orders in such competitive global bidding. It is not an accident that the cost per MW for BHEL boilers and turbines has been substantially lower than that where tied foreign credit was involved. BHEL sets were cheaper by almost a factor of 2 in most of these cases.¹

The other reason could be that in line with current thinking, the government feels that the power equipment manufacturing concerns in the public sector should be 'aligned' to the MNCs. In other words, they would like to sell off BHEL, the only power equipment manufacturer on the global scene outside the MNCs line-up. The current policy of tied credit and imported equipment would ensure that BHEL has very little orders and thus facilitate this transfer. And the importance of multi-nationalising the BHEL lies in its removal as a potential global competitor. Even though BHEL's global presence is small, there is little doubt that it prevents complete cartelisation which has been the norm in this sector. With the current set of mergers, the number of players in Europe and the US has come down to virtually four. With another three from Japan, there are only seven MNCs now operating in the power equipment sector. Even a small player can cause a lot of problems for price fixation.

The above may appear to smack of conspiracy theories. However, in the absence of any logic for following such disastrous

policies, it is difficult to find other reasons. The only other reason could be that if surviving on loans is the norm, then why bother about the future? As long as the current shortfalls are taken care of, it matters little what happens five years later. Either the policy-makers are foolish or they are knaves—that seems to be the only choice. However, can the country afford that the power sector be put in the red permanently in so cavalier a fashion?

To follow the path that the government has chosen, power tariffs have to be increased drastically. The arguments have already been forthcoming from the Fund-Bank axis that in India power is being subsidised heavily. But is this true? For proving that Indian power is being subsidised, the power tariffs are being compared across countries and it is being shown that in India, power tariffs are one-half to one-third that of advanced countries. However, how valid are the comparisons using foreign exchange rates? The rupee/

dollar parity has little to do with the intrinsic value of the rupee as with the value of our exports against our imports. It does not indicate the buying power of the rupee in India. A much clearer picture would emerge if we examine the cost of power production in India as against the selling price of electricity. Here, it is true that the current realisation is 30 per cent less than the current production costs. However, even if this implicit subsidy is removed, the cost of Indian power is well below that of the advanced countries. If the cost of production of power is much lower in India, raising power tariffs to the level of those countries who are producing much more expensive power makes little sense. The subsidy element in the power sector is not so much in the general public being subsidised but in subsidising of electricity to agriculture and the theft 'subsidy' to the tune of 12 to 13 per cent of total generation. The consumers, domestic as well as industrial, pay tariff rates which are already as high if not higher than in-

Research Project on Strategies and Financing for Human Development

The United Nations Development Programme and the IDRC of Canada are jointly sponsoring a research Programme on Strategies and Financing for Human Development in India. The Project is managed by a National Coordinator and a Programme Advisory Committee. The thrust areas selected for research support are:

1. Access, Pricing and Financing of Education and Health;
2. Social Protection, including Food Security, Social Insurance and Employment Generation Schemes;
3. Demographic Transition and Development Alternatives.

These studies, while analytical, are intended to contribute to the formulation of more effective policies and programmes in these areas. The Project will particularly encourage studies which incorporate gender concerns and on the problems of backward states. An important objective of the Project is the training of a core group of relatively young researchers to continue research work in these thrust areas.

Potential researchers will be invited to workshops during July-August 1993 for finalising the research agenda. Interested scholars are requested to send a brief outline of their proposed study including its scope and relevance.

For further details, please contact:

Prasanthnagar,
Thiruvananthapuram-695 011.

house generation costs. Elasticity in terms of pricing really does not exist in these

It is not the purpose here to argue that all is well with the SEBs. Far from it. However, the current problems that the SEBs are facing are being utilised to push a scheme which will see the power tariff going up by at least three times, the loss of the country's power equipment sector and a future drain on the national exchequer of huge amounts. And the SEBs will continue to be in the red even after such huge tariff revisions as they will have to subsidise the power being produced by the proposed private and foreign power companies. Further, the power tariffs will be pushed up to the levels which will make this an item of luxury consumption only for the favoured few. If this is not a gigantic fraud on the people, what else is it?

THE ALTERNATIVE

It may be argued that any power at whatever the cost is better than no power. However, even by the Department of Power's own estimates, the country is going to invest from internal resources to add 28,000 MWs. What needs to be examined is whether alternatives exist to either use the same amount of investment for increasing the installed capacity beyond 28,000 MWs or in controlling the demand. Incidentally, both possibilities exist today.

It has been shown by S N Roy,⁴ one of the most respected power engineers in the

country, that there are other planning options available which are not being utilised. The load curve today shows that in future we shall be short of peaking power during day and have surplus power at night. This is already so in the eastern grid and also for much of the north. This is obviously because the demand during day is much higher than at night. However, the Department of Power is planning to add coal-fired power plants, nuclear power plants and combined cycle power plants, all of which are base load plants. The coal-fired power plants will have to be put either on two shift operations or a number of such plants will have to operate well below their capacity for those periods when the demand is low. Hydel power is ideal for peaking power but has come under severe environmental opposition. In effect, the Department of Power is planning on base load stations instead of peak load stations. It will be far more economical to add open cycle gas turbines in place of the combined cycle plants as these will meet peaking duty at much lower capital costs.

The second option is to introduce demand side management for power consumption. It has been computed that it is much cheaper to invest in reducing consumption rather than investing in new power generating plants. The lowering of consumption in Europe and the US has been mainly on this account. Thus a utility in the US gave out to its customers free compact fluorescents which consume only 20 per cent electricity compared to the

normal fluorescents and avoided the installation of new power plants. In India, a study⁵ suggests that even if 20 per cent of all lamps were replaced by compact fluorescents, there would be a saving of Rs 1,500 crore per annum.

The other possibility is to lower the capital costs by standardisation and replication of a basic design with only some modifications. The economics of standardisation can lead to a substantial reduction of costs, particularly if the capital crunch is recognised and designs are made accordingly. In the power sector, the tendency has been to build rather expensive plants in the name of reliability. The plant load factors have not shown any major improvements due to this, but the plant costs have gone up considerably. The above course can lead to reduction of costs by as much as 25 per cent to the cost of plants and should be the first option to be exercised. However, with import of capital, the power planning is moving in the opposite direction—more non-standard plants and consequently higher capital costs. It might be interesting to note that in the nuclear energy sector, US capital costs are much higher than European capital costs precisely because of this. The European plants have been standardised while the US ones are not.

Currently, the Indian planning process seems to be completely comatose. No long-term planning is being done to ensure a coherent energy policy which will evaluate various options and suggest a viable path. Instead, a few buzz words like liberalisation and privatisation are being used to substitute for hard policy. However, power policies cannot be formulated on such flimsy bases. For those enamoured of the South Korean experience, it might be interesting to know that South Korea nationalised the power sector in 1962 because of the problems with private power companies. To those who wear ideological blinkers, all this means little. The selling of India piecemeal is the game, and it matters little if future generations pay a heavy price for the activities of today's carpetbaggers.

TABLE: COST CALCULATIONS PER UNIT

Cost per MW	4	crore
Equity capital—1:4 debt-equity	0.8	crore
Loan capital	3.2	crore
Accumulated interest (construction four years)	56.4	lakh
Total borrowed capital	3.746	crore
Annual generation (68.5 availability)	6000000	Kwh
Units sent out (10 per cent aux consumption)	5400000	Kwh
Coal cost (yearly)	42.64	lakh
Interest on loan (8 per cent interest rate)	30.3	lakh
Return on equity capital (16 per cent)	12.9	lakh
Depreciation (3.5 per cent)	14.1	lakh
Operation and maintenance (imported spares 1.5 per cent)	6.0	lakh
Operation and maintenance (staff 1 per cent Rs)	4.0	lakh
Total hard currency component of annual costs	63.36	lakh
Total charges, @8 per cent annual depreciation of Re	132.8	lakh
Cost per unit at bus bar	2.46	Rs
Cost per unit distribution	0.36/1.0	Rs
Cost per unit distributed	2.82/3.46	Rs
Realisation at current tariff rates	0.81	Rs
Loss per unit	2.01/2.65	Rs
Loss per MW installed	108/143	lakh
Loss for 10,000 MWs	10,856/14,300	crore

- (a) The costs of distribution in order to link the transmission systems are at least Re 1.00 per unit as against the current distribution costs of the SEBs of 0.24 rupee. Most of the proposed plants will require large investments by SEBs to link them to the grid. Therefore, Re 1.00 for distribution is quite reasonable.
- (b) The costs have been shown in rupees for loan and equity portion of the capital but are actual hard currency costs. Therefore, an annual depreciation of the rupee cost has been added as the repayments have been guaranteed in hard currency.

Burden of Proof: Danger Clause in Dunkel Text

Suman Sahai

In the TRIPS chapter of the Dunkel Draft, Article 34 contains the demand to reverse the burden of proof in cases involving process patents. In effect, the accused would be held guilty unless they can prove their innocence. This is standing accepted precepts of legal justice and human rights on their head. Its implementation to prevent farmers from saving seed of the protected varieties will also result in serious law and order problems.

THE Dunkel Draft, at the centre of a growing controversy, is widely perceived to be a document with a bias, seeking to defend the trade interests of developed countries at the cost of the developing countries. There are several clauses in the draft which would hurt Indian interests and those of the third world. One such is the demand to extend patent protection to plants contained in the section on Trade Related Intellectual Property Rights (TRIPS).

In the TRIPS chapter, Article 34 contains the demand to reverse the burden of proof in case of process patents. This clause reverses the onus for proving that patent infringement has taken place from the complainant to the defendant. This, as we shall see, is also the clause that makes it possible for patent-holders to enforce patents in the field, a task which would otherwise be impossible in countries like ours, where the rural areas are not organised and therefore not easy to police.

Reversing the burden of proof would mean that the one who makes the complaint that patent infringement is taking place, does not have to provide any evidence or proof in support of his charge. The person charged with the offence has to defend himself and prove his innocence. This in effect means the accused would be held guilty until he can prove his innocence. This is standing not only precepts of legal justice, but also human rights, squarely on their head.

If India were to accept the patenting of plant varieties, it would have devastating consequences for Indian scientists and farmers. It will mean that no further improvement in protected plant varieties will be possible without a licence from the patent-holder. It will also mean that seed multiplication except by the patent-holder will be against the law. Farmers will have to buy fresh seed from the patent-holding company for every sowing. The age-old rights of farmers to save seed from their harvests, for their own use, will be abolished.

If farmers were to persist in using seed saved from their last crop to sow the next one, either because of ignorance of the new laws or because they could not afford the cost of new seed for every sowing or out of plain cussedness, it would constitute a patent infringement and be liable for punishment.

To demonstrate how reversing the burden of proof will start a chain of consequences with very negative effects, let us consider an example. Let us assume there is a local agent for a company holding the patent for the most successfully sold potato variety, situated in district Shahjahanpur of UP. This agent would know from the land revenue records that in and around the Shahjahanpur area, let us say, 10,000 acres are under potato cultivation each season. This agent, since he is the sole supplier of potato seed in the area, will know how much seed he should be selling if 10,000 acres of potato are being cultivated. If he finds that he is selling seed that will plant only 5,000 acres, then he knows that the rest is being planted with seed that the farmers have held back from the last crop. This, according

to the new GATT rules, will constitute a patent infringement and give the agent the right to file a complaint. It can be safely assumed that seed agents will be ever vigilant in this respect. If farmers save seeds out of their harvests and do not buy fresh seed for every sowing, it will mean lower seed sales and therefore lower revenues for the patent-holding company.

With the reversal of the burden of proof, the seed agent does not have to provide any evidence or identity who exactly has broken the law, in which village or on which scale. He merely complains to the government that patent infringement is taking place in the Shahjahanpur area with respect to production of potato seed. The government then has to identify the offenders and penalise them to the satisfaction of the patent-holder.

In another variation, the patent-holder can charge the farmers of Shahjahanpur district with patent infringement. Since this will make little sense to farmers in Shahjahanpur, they will not be able to defend themselves, the collective nature of the charge will confuse the issue still further. If the patent-holder does not receive compensation from farmers for patent infringement, he can complain to GATT and demand action against India. Two things are possible then. The Indian government can be threatened with cross retaliation as penalty for not enforcing patent protection. This could translate into actions like slapping higher import duties on our tea exports to one of the OECD countries or perhaps reducing the quota of textile imports from India into the US. Or the government will have to forcibly get the farmers of Shahjahanpur to pay what is claimed as compensation.

What will be the effects of these bizarre new provisions if they are implemented? For one, the government will be caught up in constant litigation, for which it will

Indian Society of Agricultural Economics

POST OF RESEARCH OFFICER

Applications are invited for the post of RESEARCH OFFICER in the Indian Society of Agricultural Economics, 46-48, Esplanade Mansions, M.G. Road, Bombay-400 001. **Essential Qualifications:** Good academic record with at least 55% marks or an equivalent grade at Master's degree level in Economics, with specialisation in Agricultural Economics from an Indian University or an equivalent degree from a Foreign University. Candidates with a Doctorate or M.Phil in Agricultural Economics with two years research experience and publications in standard journals will be given preference. Experience in editing and publication of academic journals/books is desirable.

Age limit: 32 years. The post carries the pay-scale Rs.2200-75-2800-100-4000. In addition to pay, Dearness Allowance, House Rent Allowance and Compensatory Local Allowance will be paid according to the rules of the Society. Gross emoluments at the minimum of scale: Rs. 4,576. Higher start may be considered for candidates with research experience. Appointment to the post will be made on probation for a period of two years. Applications with copies of supporting documents/certificates and published papers and last salary drawn should reach the Hon. Secretary within fifteen days from the date of publication of this Advertisement.

have to bear the costs. It is unlikely even when farmers have been informed of the new laws that will govern their agricultural practices henceforth that they will simply accede to them. In all likelihood they will defy the laws that make little sense to them and that are so obviously against their interests.

To protect itself from the constant threat of cross retaliation, or from having to forcibly realise payments from its farmers, the Indian government will be forced to use its local administration to police the otherwise ungovernable hinterland to ensure that farmers abide by patent rules. The direct outcome of this step will be to magnify several times the opportunities for corruption in rural areas with the farmer as victim.

To enforce patent laws for plant varieties and to prevent farmers from saving seed of protected varieties, the government will have to rely on the local administration. So it will be lower level revenue and police officials like sub-inspectors of police, 'patwaris' and tehsildars who will be entrusted with the task of policing the implementation of patent laws. It is these people who will be empowered to certify whether Ram Din or Mushtaq Ali has broken the law and replanted a crop with seed that they had saved from the original variety. This authority will place the farmers so completely at the mercy of these officials that they would become vulnerable to constant extortion, whether they were at fault or not.

Thinking the consequences through, it becomes quickly apparent that these steps could have explosive political consequences. Once the farmer begins to realise that his government is penalising him so that large seed companies owned by foreigners can claim their profits, he will be up in arms. More so since he will be penalised for doing what he and his forefathers have always had the right to do.

If the farming community rises to defend its rights, rural India could see very turbulent times. The realisation of the injustice being done to them will lead to defiance of the new seed laws and to large-scale protest and violence. The generation that saw British rule and was engaged in the freedom struggle is still with us. They see parallels between the situation created by the new GATT laws and the way the East India Company which came to trade stayed on to rule India for 200 years.

Often at Gene Campaign meetings in small towns, once the consequences of patenting have been understood, this aspect is discussed, mostly by the older people. One thing is clear, not only is reversing the burden of proof a blow to the rights of individuals, its implementation could have a serious fall-out, affect-

ing law and order in the land.

The Commerce Ministry's position is that the clause on burden of proof is harmless, that it is already admitted under the Indian Evidence Act and therefore implying that accepting it would not create new adverse precedents. This is false. The fact is that burden of proof under Indian law is reversed in only two extreme conditions, both crimes of a highly sensitive social nature. One is in the case of rape, the other in what is called a dowry death.

The reversal clause is in fact the very instrument by which the protagonists of

patenting hope to enforce patent laws. Without this, policing would be impossible in the villages of India. China which like us was penalised under the US Trade Act Special 301 for not providing adequate patent protection, recently conducted bilateral negotiations with the Americans to settle the conflict. China acceded to process and product patents in the chemical and pharmaceutical sector (but not living organisms). It however resolutely refused to accept reversing the burden of proof. There is a lesson to be learnt here.

Patna By-Election: Significant Contest

Krishna Chaitanya

Almost all the left parties have supported a single candidate against the BJP sending a message to progressive forces to join hands against communal fascism.

IF all goes well people of Patna may finally have their representative in the Lok Sabha after a gap of almost two years. The by-election for this Lok Sabha constituency is scheduled for May 19. Always a prestigious seat, this time election for this seat has acquired added significance.

Election for this seat had been countermanded by the Election Commission during the 1991 general election. The whimsical and totally unjustified countermanding had been challenged by the Janata Dal (JD) candidate, Indra Kumar Gujral, and the Samajvadi Janata Party (SJP) candidate, Yashwant Sinha. Following Gujral's election to the Rajya Sabha, the JD withdrew its petition. So did the SJP. And this paved the way for the by-election. What has provided added significance to the Patna by-election is that both the CPI and JD, otherwise allies in national and state politics have fielded candidates while the CPI (ML-Liberation) and the Indian People's Front (IPF) have decided to actively support the CPI candidate.

The CPI has always been a major force in this constituency. It has either won the seat as in 1967, 1971 and 1980 or has finished close second as in 1957, 1962, 1977, 1984 and 1989. In 1989 the CPI had lost the seat due to a split in left votes as both the CPI and IPF had fielded their candidates. The combined votes of the CPI (1.59 lakhs) and IPF (52,000) far outnumbered the 1.79 lakhs polled by the BJP. Another 45,000 votes had been polled by the JD candidate.

During the 1991 elections, however, the CPI had withdrawn its candidate in view

of the complete seat adjustment among the non-BJP, non-Congress parties and in favour of the JD candidate, Indra Kumar Gujral who was not only a national leader of the party but also regarded as a fellow traveller by the CPI. Though election for the Patna seat had been countermanded, complete seat adjustment among the CPI, CPM, JD and JMM had ensued a significant reduction in the BJP's strength from nine to five and a complete routing of the Congress(I) which could bag just one seat. This time the JD has re-laid its claim to the seat and has fielded a little known man, Ram Kripal Yadav, as its candidate. Yadav had earlier fought from the Patna west vidhan sabha constituency and lost. The JD claims that as part of the seat adjustment during 1991 elections, the JD had 'given' Munger seat to the CPI in exchange for the Patna seat. But the CPI calls the JD's claim totally baseless since the CPI had been given Munger seat in return for the Gaya seat which the JD was claiming but where the CPI had stood second in the 1989 elections while the JD-supported BJP candidate had won the seat.

Performance-wise also the JD's claim over the seat is unjust. The only time it contested the seat was in 1989 and miserably lost. It stood a poor fifth and forfeited its security deposit, despite having fielded a Yadav candidate in this Yadav-dominated constituency. Even the IPF had secured 7,000 votes more than the JD. The CPI's spectacular record has already been described above. Despite several rounds of talks between the JD representative, the Bihar CM Laloo Prasad and CPI's cen-

tral and state leadership, the former has refused to withdraw the JD's candidate. It is this 'friendly contest', as Laloo Prasad calls it and the active support extended by the CPI (ML-Liberation) and the IPF to the CPI candidate which has given added significance to the Patna by-election.

Since both the CPI and JD candidates happen to be yadavs, the result of the by-election would show whether yadavs are arraigned on caste or class lines. So far yadavs have been supporting the CPI. In recent times CPI (ML) forces have also made their presence felt in Patna district as in other parts of Bihar. The recent massacre at Harinathchak in March last showed that class solidarity had taken root among the yadavs.

In the Harinathchak incident while the neo-rich yadavs organised under Kisan Sangh had no hesitation in taking cudgels on behalf of a bhumihar landlord belonging to the Sangh and attacking yadav poor peasants, organised in this case by the CPM (ML-party unity) who had overcome caste feelings to stand against yadav kulaks. The CPI(ML) and IPF-supported CPI candidate's victory would show that class polarisation has indeed taken root among the yadavs while the performance of the JD candidate would show to what extent Laloo Prasad's yadavisation attracts the yadavs.

Besides the Yadavs, the other dominant caste group in the Patna constituency are the kayasthas. A spineless community as far as political conviction is concerned and a major contributor to the state's clerkdom and bureaucracy, the kayasthas have always voted on caste lines. For instance, in the 1984 elections, the kayasthas voted *en masse* for the independent candidate, Lt Gen S K Sinha. In the 1989 elections they voted *en masse* for the BJP candidate, S N Srivastava. In the countermanded 1991 elections, however, the kayasthas changed loyalty and voted for Yashwant Sinha despite knowing that Sinha stood no chance of winning. Sinha's background in the elite IAS was the main attraction to a community whose only aspiration is of getting a foothold either in the elite IAS-IPS, the provincial bureaucracy or the clerkdom. Since then, however, BJP's advocacy of Hindutva and the new economic policy has found staunch supporters in the community. Not only has the BJP fielded a kayastha candidate for the seat but has roped in the film star, Shatrughna Sinha whom every kayastha sees as its representative in the film world, to campaign for the party.

Besides the assured support of the kayasthas, its traditional vote bank of traders and the new and growing vote bank of service sector professionals, the BJP would be greatly benefited by the total decimation of the Congress(I) in

Bihar. In this context, it would be interesting to watch the relative performance of the BJP and Congress(I) as it would show to what extent the former has gained at the expense of the latter. The Congress(I)'s support-base has been among the bhumihars who have a significant share of votes in Patna besides the rajputs, brahmins and Muslims. So pathetic is the condition of the party in Bihar that its leader Jagannath Mishra supposed to be having the largest mass following among the state's party leaders recently appealed to the film star-turned MP Rajesh Khanna "to provide leadership to the demoralised Congress(I) ranks" in "this hour of crisis". And Congress(I)'s loss is widely believed to have benefited the BJP which has emerged as the more formidable protector of upper caste interests, brahmanical social order and the elite consumption-oriented new economic policy. Any accretion in the votes polled by the BJP would show that the traditional supporters of the Congress(I), upper castes like bhumihars, brahmins and rajputs have moved towards the BJP.

Also interesting would be the voting behaviour of the Muslims. Before the 1989 elections the Muslims used to support the Congress(I). The Bhagalpur riots however changed all that and in the 1989 elections they voted for the CPI candidate following its secular credentials. Since then, the left's painstaking work among the masses and the government's commitment to maintain communal harmony has ensured peace and amity on the communal front in Bihar. The voting behaviour of the Muslims would show who they see as a more dependable secular force, the left or the JD. Another factor is the Kisan Sangh under which landed elements from various castes have organised themselves in Patna.

Ramlakhan Singh Yadav, the man behind this body is an old Congressman who at the time of 1991 general elections joined the JD and then defected to JD(A). The JD(A) has withdrawn its candidate in favour of the CPI. Yadav would obviously not like to deploy the muscle power at the disposal of the Sangh for the victory of the CPI. It would either be for the BJP or Congress(I). Given that the CPI(ML) and IPF have decided to actively work for the CPI candidate they will definitely resist the booth-capturing by the Kisan Sangh lumpens.

By all indications it is going to be a fight between the CPI and the BJP and in today's context it means a fight between progressive secular democracy and regressive communal fascism. Not only CPI (ML Liberation) and IPF, but also MCC, MCPI, SUCI, Forward Bloc and RSP have extended their support to the CPI candidate and have decided to campaign unitedly for the CPI candidate although the CPI(M) has not yet decided whom to support. This sends a clear signal to the anti-Congress(I) anti-BJP forces throughout the country to join hands against communal fascism and imperialist-dictated economic policy. Admittedly the victory of the left candidate would not be as easy as it would have been if the JD were not in the fray. But even if the BJP wins by default due to a split of anti-Congress(I) anti-BJP votes, the message would still be the same. The performance of the left candidate would also serve as a lesson to the CPI that it is futile playing second fiddle to the JD and instead of that the CPI should firstly strive for unity of the left forces since it gives better bargaining power to the united left *vis-a-vis* the other non-BJP non-Congress(I) forces.

The Indian Association for the Study of Population announces an Essay Competition under Chandrasekaran Award. The essays written on "Population Growth and Sustainable Development" by young scholars (below 40 years) are invited. First prize Rs.1,500/-, second prize Rs. 1,000/- and third prize Rs.750/-.

The articles for inclusion in the competition should reach Prof. P.C. Saxena, I.I.P.S., Govandi Station Road, Deonar, Bombay-400088 by 15 October, 1993 at the latest.

State-Sponsored Attack on 'Pani Parishad'

Shripad Dharmadhikary

The Gujarat government has unleashed a systematic campaign to intimidate and silence the movement protesting against the Narmada Project.

ON May 8, about 40-50 hooligans stormed into the Shreyas Foundation Hall in Ahmedabad where the 'Pani Parishad Convention on Water' organised by the Jal Raksha Abhiyan (JRA) and *Abhiyan* weekly was in progress. The hooligans were shouting slogans like 'Medha Patkar vapas jao' and 'Narmada Yojana banke rahegi', etc. And even as the keynote address was being delivered by B B Vohra, they snatched away the microphone, started destroying property, beating up and threatening participants, and declared that "all those opposing the Narmada Project must leave the hall immediately—or else they will be beaten up".

The Jal Raksha Abhiyan is an informal group of individuals/organisations working and interested in the water-related issues in Gujarat. The aim of the Abhiyan is to undertake research and campaign on the issues related to water, and initiate a people's movement towards a participatory, community controlled water management practice. The Pani Parishad was being held with the purpose of facilitating wide-ranging and intense discussions on the water problem of Gujarat. Narmada was neither the central theme of the Parishad, nor was it an anti-Narmada programme. In fact, to involve as many diverse opinions as possible, the organisers had invited, apart from NGOs, social action groups and experts, all the MLAs, MPs and taluka pramukhs (heads) of Gujarat. Navin Shastri, the Gujarat minister for rural development, had also sent a message, commending the effort and sending his best wishes to the Parishad. Many MLAs, political figures and prominent people from Gujarat and outside had confirmed their participation. Among them were Jaynarayan Vyas, Praveensingh Jadeja (both MLAs), Mahesh Thakker (former MLA and prominent political figure of Kutch), Kishor Sant (prominent Gandhian and recipient of Vrikshamitra Award), Anil Shah, director of the Aga Khan Rural Support Programme, etc. The trouble began when the invitations to the Parishad mentioned that one of the speakers invited was Medha Patkar of the Narmada Bachao Andolan (NBA) who had been invited as one of the

speakers for the session on Narmada Project and Gujarat's Water Policy on the second (and final) day.

Some people seemed to find this objectionable, and a few days before the Parishad, the management of the hall received telephonic threats from one Leelaben Desai of the Ekta Parishad—an organisation whose head is the wife of the chief minister Urmilaben Patel. A number of phone calls followed, asking the management to refuse to give hire the hall out to the Parishad. The management remained firm. The organisers promptly informed the police commissioner of Ahmedabad and the police station about the threats and requested protection. This was done in writing.

On the morning of May 8, when the Parishad was to begin, the police were conspicuous by their absence. It was around 12.00 noon, that the hooligans pushed aside the two security guards at the gate and stormed into the premises. Shouting slogans, they broke into the hall as the keynote address was being delivered by Vohra. They all went in front of the dais, snatched the mike away, and started screaming slogans. And then, suddenly, they went on a rampage. They threw down the mike, broke it, and started using the iron rod to destroy more property. Banners, charts, maps were torn off. Wooden frames (to hold banners, etc) were broken and the sticks used as weapons. Beds, pillows, chairs were thrown about. Tube-lights were smashed. All the while, the delegates tried to sit peacefully, offering neither resistance nor provocation, expressing their protest in a non-violent manner.

The hooligans started threatening, beating up, abusing the delegates. Anyone who said anything, was immediately targeted. They started shouting "where is Megha (Medha)"? When Ashwini Bhatt, a prominent Gujarati writer, literary figure said that she had not come, the hooligans attacked him and tried to beat him up. They also tried to beat up others. Those who were more seriously hurt included Mahendra Upadhaya, Diptiben Raju, Raju Purohit, B B Vohra, Kishor Sant, and Ketan Sanghvi (editor of *Abhiyan*).

The hooligans also tried to molest Diptiben (a Gandhian social worker), and were using most abusive language against women. All the while, they asked all those who opposed the Narmada Project to leave immediately or would be beaten up. Raju Purohit was beaten up because he said that he was opposed to the project.

After about half an hour's destructive, violent action, the hooligans started leaving. Some of them were easily identified. Most belonged to the NSUI or the Youth Congress(I) and claimed to be supporters of Urmilaben Patel. Many of them were drunk (smelling of liquor heavily)—Gujarat is a dry state. Some of those identified included Ashish Amin, Sunil Jikar, Mihir Shah, all of the NSUI. The fact that the police had not given any protection in spite of prior intimation, clearly indicate the connivance of the state, the police, the ruling party in the matter. It clearly exposes the fascist tendencies of the Gujarat government which is not allowing anyone the freedom to express their views about the Narmada Project. This violent attempt to curb the fundamental rights of the people needs to be strongly condemned.

Immediately after the hoodlums left, the delegates strongly condemned the incident, and resolved to continue the discussions with Medha Patkar participating on the second day. Meanwhile, Raju Purohit, Kishor Sant, Diptiben Raju and Girishbhai Patel went on a one-day fast to protest against the event. Later in the day, a statement signed by about 35 organisations was issued condemning the incident.

This event is not an isolated one, but is part of a systematic campaign launched by the state and the ruling party in Gujarat to intimidate and silence the movement against the Narmada Project and anyone who believes that its voice should be heard. On March 26, Congress(I) workers staged a violent demonstration and tried to prevent Medha Patkar from entering the venue of a public meeting to be addressed by her. On April 22, a violent mob of the workers of the ruling party threatened and threw stones on the peaceful demonstration by the NBA at Naswadi town (Baroda district). The NBA was protesting against the rape on a tribal woman, Budhiben. The following week, two meetings of Medha Patkar were disrupted by violent mobs who threw eggs and tomatoes, shouted threats and blackened Patkar's face. The mobs were led by known Congress(I) worker Nimaben Acharya. The police, present on the occasion, were mere spectators. In all the incidents, the key elements have been violence and abuse, participation by members of the ruling party, and inaction of the police. The issue is clearly not at all whether the Narmada project is good or bad but of the basic right to freedom of thought and speech. It is this that is being attacked.

Law and Women in Unorganised Sector

G Ravindran Nair

Most women workers are in the unorganised sector where the labour laws, which exist, are most lax in the implementation.

JHANJUBAN is a 60-year old 'masala' grinder in Bhavanagar, Gujarat. In the peak season she walks the streets of middle class neighbourhood, calling out for work. She stoops to sit in the courtyard, or even on the street, and pounds spices in her iron vessel. Her customers pay her by the kilo (around Rs 2) and a few are more reasonable than others. Some want fine masala, and give her a small sieve for sifting it. Some weigh her work after she finishes her job, so the loss due to seeds and stems falls on her. Her three sons are construction workers living and working elsewhere. She borrows money from a neighbour until she earns something or until her sons help her pay her debt. She has been doing this work ever since she was six years old. Miserable indeed is the plight of such Jhanjubans in the country who must slog all through their life for mere survival.

Seventy-five per cent of the four lakh coir workers in Kerala are women. There is a threat from the neighbouring Tamil Nadu where new husking machines are being introduced and only men are being employed on these machines. The minimum wage is officially Rs 11.80 for this work, but they cut it down to piece work and women earn a niggardly Rs 8. Their work involves soaking the coconut shell and the green husk so that they can extract the fibre inside. They beat the husk to prepare the fibre for spinning, a job performed either by hand or machine. Gomati has been doing this job ever since she was 12. She had studied up to IV standard. She is now 46. Her husband deserted her long ago, and her daughter, also deserted, lives and works with her. Her sons live separately. Gomati earns Rs 15 a day for husking and spinning 100 coconuts.

The number of women construction workers in Tamil Nadu is around five lakhs. Contracting and sub-contracting reduce these women workers to an abysmally low status. Women occupy the lowest rung, though they do masonry, earthwork, mosaic work, roofing and concrete work. Although these are skilled jobs, and backbreaking too, these women construction labourers are debunked as 'unskilled labour' and exploited in umpteen ways, flouting all laws and canons of humanity. Instances of the merciless exploitation of women workers in the informal sector could be as many as the number of such women struggling for a subsistence living in a wide gamut of sectors as agriculture, sericulture, animal husbandry, fisheries, handlooms, bidi industry, dairying, handicrafts, garment-making, food processing, domestic work, construction industry, etc.

According to the ministry of labour: almost 90 per cent of the female labour force in India comprises women in the informal sector, but paradoxically, all the laws made so far have been made with an eye on the women in the organised sector which forms a mere 10 per cent of the workforce. This has resulted in the marginalisation of a majority of women workers. So much so, the definitions of 'work' and 'production' as they exist today, whether in the census or in other surveys on work, are such that subsistence production and services provided by women are either ignored or taken into account marginally.

A cardinal feature of all labour laws is that all the enactments pertaining to social security, welfare, safety and working conditions and the like is based on the presumption of an employer-employee relationship. Hence arises the need to define an employee and an employer because the law places the onus on the employer to dispense the benefits as ordained by the statute. But in respect of the amorphous mass of women workers in the unorganised sector, either the employer keeps on changing frequently, as in agriculture or construction work (where assured employment for a minimum period in a year is itself in doubt), or there is no direct relationship with the ultimate employer as in the case of occupations where the only point of contact for the worker is a lower level intermediary like a contractor or sub-contractor—a phenomenon that pervades the bidi-rolling industry, or agarbatti-making trade or the entire home-based work and the construction industry.

While there is enough scope and need to improve the contents of the existing labour legislation, one finds shockingly enough that the enforcement machinery is itself ill-equipped to do its onerous job. Provisions of the law are imprecise and nebulous, making them a subject of raging war of words in the corridors of courtrooms. The penalties provided by law for violation are inadequate and the participation of the workers in the enforcement of the law is totally absent. The adjudicating machinery and the magistracy are too far removed from the workers and from their homes for them to seek sanctuary in the corridors of justice without considerable loss of time or wages.

If we choose to examine each piece of legislation, we can easily discover yawning loopholes when women labourers are concerned. Take the Minimum Wages Act, for instance. The act, as it stands now, merely provides, among other things, a mechanism for fixing and revising the minimum rates of wages, but does not give any guidelines

as to the basis on which the minimum wages are to be fixed or revised. In fixing and revising the minimum rates of wages, the basic needs of the worker and her family are not kept in view. While revising the minimum wages, the authorities should take cognisance of the changing poverty line on the basis of shifting price index. In respect of home-based women workers—by and large, excepting for handloom, most home-based workers are women—it is seen that the employer is saved from incurring not merely expenses relating to setting up of a factory, installing equipment but also expenses for supervision and control.

The problems of the inter-state migrant workers do not receive any attention despite the Inter-State Migrant Workers (Regulation of Employment and Conditions of Service) Act 1979. There are other pieces of legislation like the Contract Labour (Regulation and Abolition) Act, 1970, the Maternity Benefit Act, 1961, Equal Remuneration Act, 1976, etc, which are either badly implemented or violated.

The Bidi and Cigar Workers (Conditions of Service) Act, 1966 is an important piece of legislation since bulk of the home workers in bidi rolling are women. Here too the women are taken for a ride. Invariably, the employer is reluctant to register his women workers in his books and issue identity cards and log books for them. As a result women workers do not get benefits provided by law; even wages are not paid to them directly, but to the male members of the household whose names alone, in most cases, figure in employer's books.

One of the worst cases of legal violation is in respect of the pitiable plight of the construction workers. The poor women work under an employer or more often under a contractor or sub-contractor for short periods and move from one employer to another as also from one location to another with no guarantee of continued employment. This absence of continuing relationship between a construction worker and his employer with the system of contracting and sub-contracting, makes it difficult for the women workers to get wages on a regular basis. Women labour is denied all the benefits including the facility of creches for the tiny tots who are left in the charge of the older girls, who, just because they do all the baby-sitting, seldom go to schools. A few mobile creches provided by voluntary agencies have only pointed to the wide chasm in the services.

The National Commission on Self-Employed Women and Women in the Informal Sector which submitted its report a few years ago recommended the setting up of a separate wing in the union labour department to deal with the problems of unorganised labour. The Commission felt that the strength and prestige of this wing would have to be commensurate with the responsibilities towards this sector of labour which accounts for 90 per cent of the total workforce.

Inter-Regional Variations in Health Services in Andhra Pradesh

Economic development and availability of investible surplus, commercial activity and infrastructural facilities appear to be the major features determining the spread of health services in the private as well as the public and voluntary sectors. A comparative study of advanced and backward districts in Andhra Pradesh.

IT is well recognised that the health status of a population is shaped by a variety of factors like food, water, sanitation, housing, income, education and availability and accessibility to health care facilities.[1] Health services are just one of the inputs required to improve the health status of a population. Just as health status is influenced by socio-economic factors, similarly, health services are shaped by socio-economic and political factors in society.[2] These factors play an important role in influencing decisions regarding policy, amount of resources allocated, choice of technology, manpower development, education and priorities in research, which in turn shape health services in a given region.[3]

Studies which have looked at health services development in India have confined their attention to the national level. These studies have pointed out that public services are essentially curative, capital intensive and are oriented towards urban areas. As a result, it is not surprising that two types of sub-systems exist simultaneously. One consists of the ill equipped primary health centre network for rural areas which is starved of resources and the other is the better equipped hospital network in urban areas which gets the lion's share of the total resources.[4] Apart from the public sector which is state supported, the private and voluntary sectors also provide health care. The private and voluntary sectors were well entrenched in the colonial period itself and ever since independence they have expanded significantly. While information on these two sectors is not easily available a few studies have commented on their sizeable presence in providing health care.[5] In addition to this, one finds that while the 60s was the growth period for health services, there has been a gradual decline in expenditures through the 70s and 80s.[6] This has been an important reason for the growth of the private sector, which has grown significantly since the mid-70s.[6] (Based on information published by the Central Bureau of Health Intelligence.)

Hence any effort at health care planning has to take into account the public, private and voluntary sectors. The issues that need to be addressed are rural-urban disparities in the provision of services as well as the inter-regional disparities across states. While studies at the national level give us indications of broad trends, they provide little information on variations across states. Keeping in mind the size and diversity of the country the Bhore Committee had recommended that health services was to be a state subject. While the centre was to provide policy directions, the states had full authority with respect to resource allocation, location and administration of institutions.[7]

This article focuses on the inter-regional differences of allopathic health services provided by public, private and voluntary sectors within Andhra Pradesh. We look at two economically advanced districts, viz, Krishna and Guntur which belong to the coastal Andhra region, and two backward districts, viz, Mahbubnagar and Medak which belong to the Telengana region.

GOVERNMENT HEALTH SERVICES

A review of policy relating to health care in the state indicates that the outlay on medical and public health has been meagre while the priorities have been on strengthening allopathic medical education and curative services. There are 337 allopathic hospitals, 786 dispensaries, 906 primary health centres and 6,121 sub-centres functioning in the state. The total bed strength in this sector is 29,096. On an average there is one bed for 2,018 persons. There are 5,814 doctors and 5,663 nurses employed in this sector that is, one doctor for 10,097 persons and one nurse for 10,366 persons. There are 1,250 health visitors, 637 health supervisors, 5,012 auxiliary nurse midwives and 10,225 midwives in the state.

Information on the private sector is limited. Information is available only for 21 of the 23 districts. Available data indicates that there are 22,192 beds in the

private sector. (The indicated bed strength is an approximation and the actual figures may be much higher.)

The number of personnel employed in the private sector is not available. The total bed strength in the voluntary sector is 7,013, and according to available information 373 doctors and 1,816 nurses were employed in this sector in 1981. The total bed strength in the private and voluntary sectors is thus almost as large as (29,295 as against 29,096) the government sector. The total number of institutions, bed strength, bed/population, personnel/population ratios are only averages and tell us little about how these services are distributed across districts.

PUBLIC SECTOR

The public sector bed/population ratio for the advanced districts is more favourable than for backward ones but from 1961 onwards the gap has narrowed.

An additional factor that has to be kept in mind is that Guntur had a teaching hospital even before the formation of the state. The teaching hospital at Krishna is recent and the two backward districts do not have one at all.

There has been a substantial growth of district and taluk hospitals in Krishna district during 1961-81. In Guntur, there has been only a marginal increase in taluk hospitals and a substantial increase in teaching hospitals; in Mahbubnagar a marginal increase in beds in taluk and district hospitals and in Medak there was substantial increase between 1961-71

TABLE 1: HOSPITALS IN SELECTED DISTRICTS OF ANDHRA PRADESH

Districts	No of Hospitals	Total Bed Strength	Bed/Population Ratio
Krishna	15	976	1:3122
Guntur	14	1493	1:2300
Mahbubnagar	18	438	1:4410
Medak	11	478	1:3780

Source: Statistical Division, Directorate of Medical and Health Services, Hyderabad, 1987.

TABLE 2: BED/POPULATION RATIO IN SELECTED DISTRICTS FOR 1961, 1971 AND 1981

Districts	Years		
	1961	1971	1981
Krishna	1:4663	1:3682	1:3663
Guntur	1:3751	1:2130	1:2331
Mahbubnagar	NA	1:5220	1:5770
Medak	1:15337	1:7226	1:5377

Source: Statistical Division, Directorate of Medical and Health Services, Hyderabad, 1986.

(mainly in 1968-70) in both district and taluk hospitals.

The PHC/population ratios presents little variation across the two sets of districts. This is in keeping with directions prescribed by the centre regarding PHC/population ratios (Table 4). With the introduction of manual PHCs in 1986, the PHC/population ratio is more favourable for the backward districts.

Table 5 shows that the number of sub-centres have increased in all four districts and there is very little variation in the sub-centre/population ratio. Unlike PHC/population ratio, the sub-centre/population ratio is poorer in backward districts than in others.

The doctor: population ratio in Krishna is 15,711, 7,290 in Guntur, 14,461 in Mahbubnagar and 12,907 in Medak. There has been a steady increase in the number of doctors in backward districts from 1961 (Table 6). Differences have narrowed, however Guntur has a more favourable ratio due to the teaching hospitals there.

A fairly high percentage of the post of civil surgeon and civil assistant surgeons (hospitals) have been filled while only 56.9 per cent of the posts of civil assistant surgeons (PHC) are filled in Krishna, 74.2 per cent in Guntur, 47 per cent in Mahbubnagar and 67.3 per cent in Medak. In general, a higher percentage of these posts have been filled in the advanced districts than backward districts with the exception of Medak which has a higher percentage of posts filled in PHCs compared to Mahbubnagar. This is mainly because of the proximity of Medak to Hyderabad, as a result of which doctors posted to PHCs in Medak live in Hyderabad and commute to work. However this does not give us any information on the number of doctors who have availed of long leave after joining duty, nor about the regularity of their attendance at the PHC.

There has been a substantial increase in the number of nurses in selected districts since 1968 with the rate of increase being higher in the two backward districts between 1976-86 (Table 7).

However a higher percentage of nursing posts are filled in Krishna and Guntur (90-100 per cent), the more advanced districts than in Mahbubnagar and Medak where only 48 per cent and 41 per cent of the posts are filled.

The ANM/population ratio is better in the advanced districts and while almost 8 per cent of the posts are filled in the advanced districts, only 77-82 per cent are filled in backward districts (Table 8).

There is little difference in the percentage of posts filled in selected districts, however the health inspectors (HI)/population ratio is better in the advanced

districts compared to the backward districts (Table 8). Despite the relatively higher percentage of posts filled, the difference in HI/population ratio exists because the number of posts sanctioned in the backward districts is lower.

A high percentage of health visitor (HV) posts have been filled in all the selected districts with a more favourable HV/population ratio in advanced districts as compared to the backward ones (Table 8).

A review of various categories of personnel in the public sector shows that there is no significant difference between the two sets of districts in the case of doctors. There is a difference in the personnel/population ratios across selected districts for nurses and paramedical workers. The paucity of paramedical staff in backward districts affects the functioning of PHCs and SCs in these areas. Therefore although there is little variation in PHC/population ratios across districts, it is quite evident that PHCs and SCs in backward districts are poorly staffed as compared to the advanced ones.

DISTRIBUTION OF INSTITUTIONS

Ratios such as PHC/population, SC/population or personnel/population tell us little about how these institutions are distributed within a district. Here one has to take into account the location of institutions, along with development of infrastructural inputs like roads and transport facilities, which are important determinants for availability and utilisation of institutions.

According to the district census handbooks in Medak and Mahbubnagar 83 per cent and 77.5 per cent of the village fall in

the population range of below 499-1,999, respectively. In Krishna 81.5 per cent of the villages fall into the population range of 500-4,999 and in Guntur 73.5 per cent of the villages fall into the range of 500-4,999. Therefore there is variation in the size of settlement patterns across the two sets of districts. However, if one examines the location of medical amenities they are concentrated in villages with a population of 5,000 and above in all four districts: 92.86 per cent of the amenities in Medak, 87.10 per cent in Mahbubnagar, 77.12 per cent in Guntur and 79.22 per cent in Krishna. This reduces accessibility to services especially in backward districts where villages are smaller and are more dispersed. The two advanced districts have a higher percentage of villages connected by 'pucca' roads: 72.4 per cent of the villages in Krishna and 87.28 per cent in Guntur while Mahbubnagar has 58.23 per cent and Medak has only 47.72 per cent of its villages connected by pucca roads. This would definitely hamper accessibility to

medical amenities in backward areas. A study conducted by the state government on distribution of villages according to distance from PHC showed that the coverage in advanced districts was better: 72 per cent of the villages in Krishna and 70 per cent of the villages in Guntur within 15 km of a PHC. In backward districts 58 per cent of the villages in Mahbubnagar and 61 per cent of the villages in Medak were within 15 km of a PHC (Table 9).

Ashish Bose[8] who has done a similar exercise for a few north Indian states points out that little attention is paid to variation in size of settlement patterns in the health policy. This has resulted in a blanket approach to the location of institutions irrespective of population density or size of settlement patterns. These differences become even sharper when one takes physical accessibility, i.e., how many villages are linked with roads and availability of transport facilities.

PRIVATE SECTOR

While the public sector has expanded considerably, so has the private sector. Private medical practitioners in rural areas are often untrained persons dispensing allopathic medicine and their presence is fairly widespread across districts.

Available data on nursing homes indicates that the advanced districts also have a higher bed strength relative to population compared to the backward districts (Table 11). The growth of private nursing has been significant in the advanced districts with the bed strength in the private sector double that of the number of beds in the public sector (Table 12). The Indian Medical Association membership can be taken as a supportive index for private institutions and it is seen that there are more members in Krishna and Guntur than the backward districts.

The highest concentration of nursing homes in the advanced districts is in cities followed by towns. Even in backward districts they are restricted to major towns. Basically they are urban-based and provide mainly curative services with little public health input.

Institutions in the voluntary sector are essentially run on a non-profit basis. The majority of these agencies are run by missionaries. The distribution of voluntary agencies across selected districts, both in terms of number of institutions and bed strength is skewed in favour of advanced districts. Although year-wise information is not available regarding establishment of institutions, several dispensaries were established during the turn of the century by missionaries in Krishna and Guntur districts which were under Madras

Presidency. In Medak and Mahbubnagar which were under Nizam's rule, comparatively fewer hospitals were established by missionaries during the early 1900s. This difference still persists in a stark fashion.

The distribution of voluntary agencies is not only skewed in favour of advanced districts but even within these districts, there are more agencies in the advanced taluks. The availability of pucca roads, electricity and communication seems to influence location of agencies. This partly explains why there are more agencies working in the relatively advanced taluks in Krishna and Guntur. In Mahbubnagar and Medak there are not only fewer organisations but most are without electricity, or a post office though not all of them had pucca roads. Another noteworthy feature is that the proximity of these backward districts to the city, Hyderabad, becomes an important factor in the location of agencies, since this allows the staff to live in the city and commute to work. A number of voluntary agencies, for instance, have been located in the districts surrounding Hyderabad, viz., Ranga Reddy, Medak, parts of Mahbubnagar and Nalgonda.

FACTORS INFLUENCING GROWTH OF HEALTH SERVICES

The overall trend in all three sectors is for services to be more concentrated in the advanced than the backward districts with the least variation being within the public sector.

The reason for lower inter-district variations in the public sector is probably a reflection of political factors. For instance, the conscious attempt of the government to maintain regional balances within the state has been an important factor for the relatively low inter-district differences. This is well-illustrated in the case of the narrowing of differences between the selected districts in Telengana and coastal Andhra in terms of bed/population and institutions especially from 1971—an aftermath of the Telengana agitation

which highlighted the socio-economic backwardness of Telengana.

Although the average PHC/population ratios show little variation across districts, political pressures have played an important role in the location of PHCs. Up till the mid-60s this was governed by the AP Panchayat and Zilla Parishad Act, 1959. According to which a specified amount of land and cash had to be contributed by villages for the setting up of PHCs. Due to the contributory nature of the scheme any village that donated required amount of land and cash could have a PHC. As a result of this "some primary health centres were located at one end of the block where communication, education and accommodation facilities were not available, and coverage was much reduced".[9] There was also an instance of a block having two PHCs while others had none. This definitely affected the availability of, and accessibility to services. By about the mid-1960s the state government assumed full responsibility for locating PHCs but local political pressures continued to play an important role. What is important here is the fact that welfare measures are used by local leaders to consolidate their position and redeem their campaign pledges. One would therefore agree with Francine Frankel who points out that high caste leaders often redeem their campaign pledge by providing drinking water, school building or other welfare services to consolidate their position.[10] The use of welfare services by ministers to strengthen their own position in their constituency is well-illustrated in the case of an increase

in bed strengths in taluk and district hospitals. For example, in the taluk hospital at Gudivada which was the chief minister's constituency, the bed strength was increased from 30 to 75 during 1985-86. This also happened in the taluk hospital at Mangalagiri, which was the constituency of a former health minister. During the same period there was no increase in bed strength in Mahbubnagar and an addition of only six beds to a taluk hospital in Medak.

While political factors do influence development of health services, the general level of economic and infrastructural development influences accessibility to the utilisation of institutions. As discussed earlier infrastructural inputs like roads and transport facilities are better developed in the advanced districts as compared to the backward ones. The Kerala experience has shown that an even spread of health services coupled with well-developed infrastructural inputs has contributed to better accessibility and utilisation of institutions.[12] In Kerala it is the nature of settlement patterns, size of villages, roads and transportation which increase accessibility to health services. A study of primary health centres in Andhra Pradesh points to the lack of adequate roads and transport facilities as an important reason for reduced accessibility to these institutions.[11] The general level of development of a region also influences the willingness of staff to work. Most doctors prefer to work in urban areas. When they are posted to PHCs they prefer advanced districts to backward ones because they are ensured certain minimum facilities like water, electricity, transport and schools. In certain PHCs in Nalgonda, Medak and Mahbubnagar, it is not uncommon to find the posts of doctors vacant either because they have not been filled or the doctor after joining, has taken long leave. In such instances it is the paramedical staff who run the PHCs.

In terms of bed strength, Krishna and Guntur districts have a higher bed

strength compared to Medak and Mahbubnagar. In fact the private bed strength is almost double that of the public sector in the advanced districts. In order to explain this variation, one needs to look into the changes that have taken place in the structure of the economy in the advanced districts as a result of the green revolution which saw the rise of rich peasants and capitalist farmers who diverted the surpluses accruing from the green revolution into a number of commercial and industrial activities.[12] The commercial enterprises included hotels, cinemas, shopping centres as well as nursing homes. Although we do not have information on the years of establishment of institutions for all the selected districts, the data for Krishna district shows that maximum growth of private nursing homes took place during the late 1970s to early 1980s, which is the period when other commercial enterprises also grew in these areas.

The growth of the private sector in health care is directly related to the level

of economic development. This link is logical because it is the economically developed areas which not only provide the market for these services but also the surpluses to invest in commercial enterprises. This in fact tends to increase the inter-regional differences with respect to provision of health services between advanced and backward districts.

In the voluntary sector the number of institutions, bed/population and personnel/population is clearly skewed in favour of the advanced districts. The reasons for this variation are many. Firstly, since Krishna and Guntur were under Madras presidency, a number of dispensaries were established by missionaries during the turn of the century. This was not the case in Mahbubnagar and Medak which were under Nizam's rule. In Krishna and Guntur districts, Christians are the second largest community unlike in Mahbubnagar and Medak where Muslims constitute the second largest community. Secondly, during the 1970s, there was a spurt in the growth of voluntary agencies

viding relief to the victims of the cyclone. During the same period a few organisations were established in Mahbubnagar and Medak.

The distribution of voluntary agencies in the advanced districts is skewed in favour of the well-developed taluks within these districts. Jesani et al [13] in their report on voluntary organisations in health care in Maharashtra observe a similar pattern of distribution as in our study districts. They have found that nearly 70 per cent of the voluntary agencies are concentrated in the relatively developed districts. They have also observed that in the selection of districts for location of agencies voluntary organisations prefer those areas where infrastructural facilities are adequately developed. The logic of location of voluntary agencies appears to be similar to that of the private sector, i.e., they are located and are active in areas with better economic and infrastructural facilities. Are infrastructural inputs an essential pre-requisite for efficient utilisation and functioning of health services? Do voluntary agencies choose developed areas because the profit motive leads them there or in order to show better results in their work or for some other reasons?

India's New Secular Activism

Exploding Some Myths

Anwini K Ray

Contemporary secular discourse in its obsessive concern exclusively with the communal politics of manifestly communal parties as being the main source of communal violence has tended to ignore the larger structure of violence within the political system. Secular discourse needs to be anchored within the primary concerns of political science around the nature of the state in a plural society and more specifically, liberal democracy as a structural imperative of India's territorial integrity.

COMMUNAL politics has always thrived off elemental passions based on myths and folklores around a perceived stereotype oppressor existential or historical—to justify its own belligerence. In fact, most ideological inspirations have been mobilised around the perceived strength of the 'immoral adversary' based on such myths. The Nobel Laureate, P M S Blackett, described it, in the context of the Cold War, as the 'looking-glass strategy' through which one tries to build in the image of a highly magnified vision of the adversary. Communal politics in India has also broadly followed the same historical pattern.

Not just communal politics in the sense of the well known religious identities but the increasing proliferation of many other revivalist ascriptive identities around language, caste, tribe and spatial locations in India in recent times, have followed much the same pattern of mass mobilisation. This is not to suggest that, they are all 'false consciousness', or necessarily retrogressive in their social or political implications. They are often legitimate expressions of individual choice in the liberal democracy of a plural society, particularly with India's staggering range of such diversities; and, their respective social or political implications cannot be objectively pre-determined, except on normative grounds, which are always contestable. India's liberal democracy, within its constitutionally enshrined structure of equal rights of citizenship, does not provide for any normative hierarchy among such identities, ascriptive or otherwise. So that, while the content of such aspirations may be perfectly legitimate and predictable in a predominantly traditional plural society, the form of such assertions ought to be the critical test of their democratic legitimacy. It is within this framework that

the high-profile assertions of Hindu communal politics ought to be viewed.

But secular perceptions of Hindu communal politics, specially since the beginning of the Ayodhya dispute, seems to be heavily influenced by the impact of relatively recent events, around which a lot of counter-myths have been conjured by a section of new secular activists. This has led to a highly stylised image of the adversary and a certain level of demonisation of the communal ideology and communal politics, particularly its Hindu version. While Hindu communal ideology, because it is targeted at the majority, poses a qualitatively different kind of threat to India's liberal democracy in its present tenuous stage, the perception of its strength, resilience and potentials, appears to be both unreal and counter-productive.

The recent series of events influencing the new perception are: (i) the new symbols of its mass mobilisation around historical structures of oppression, with multiplier potentials; (ii) the improved electoral performance of the BJP in the general elections of 1991, with its ideology of Hindutva; (iii) the emergence of a Sangh Parivar, with visible operational convergence of aims and objectives on the Ayodhya dispute and the destruction of the Babri Masjid; and (iv) the communal violence around the country, particularly its most asymmetrical location this time, in the commercial and industrial centre of Bombay, including some of its prestigious residential areas. Together, such events in quick succession tend to mystify our image of Hindu communalism. But let us first analyse each of these events separately to establish the nature and extent of their linkages, rather than assume a logical continuity between them simply because of their temporal and sequential conjuncture. Before that, we ought to situate these

events within the historical and empirical context of India's contemporary political economy.

Quite obviously, communal ideology and Hindu communal politics, despite their long ancestry in India, have a particularly favourable conjuncture of global and national politics in recent times: the retreat of communist ideology, the global assertion of revivalist ascriptive identities, the growth of Islamic fundamentalism around India's neighbourhood and its exposure to the new role-models of our *nouveau riche* culture—the NRIs—with critical nexus within the political economy and the continued tensions in our relationship with Pakistan and Bangladesh, supplemented by the recent politics in Punjab and Kashmir, have all contributed to the projection of a new profile to Hindu identity in recent times.

Within domestic politics, the collapse of the earlier party-system at the national level, the leadership-vacuum within the remnants of the Congress Party after the Gandhi-Nehru era, the popular resentments against the Janata Dal's 'Mandalisation' plans, and the dent in the ideological appeal of the mainstream communist parties within their residual ideological masthead of secularism, have all contributed to the advantage of the BJP as the only remaining organised national party.

Under such circumstances, a causal nexus between the relative salience of the Hindutva ideology, and the accretion of the strength of the BJP as a political party, seems to be axiomatically assumed within the new secular discourse. This, as we would argue, could be easily over-determined, to the BJP's advantage. Besides, since the elections of 1991 was preceded by the communal politics around Ayodhya—the 'rathayatra' and the 'shilanyas'—the BJP has sought to project its relative electoral success as part of a new resurgence of Hinduism through Hindutva; a sharp communal polarisation of the society around Ayodhya, of which, it claims to be the sole beneficiary. If true, it has ominous potentials, because such symbols of historically perceived oppression could offer unlimited potential for communal politics in India's ancient civilisation. But again, as we would argue, such claims are based on a highly stylised version of the reality.

But before we analyse BJP's claims, it should be obvious that the search for historical symbols of oppression for purposes of communal mobilisation is an indication of the absence of more potent credible options based on existential

realities. Within India's demographic profile of the religious communities, it would be difficult for Hindu communal politics to mobilise passions around an existential adversary as the oppressor. In fact, with India's dominant and deprived sections cutting across its multiple ascriptive identities—though not proportionately—it may be difficult to identify any single identity as the oppressor on a cross-national scale. Consequently, Hindu communal politics had to invent folk-myths around relative population increase of its adversaries, doomsday scenarios around the migration from neighbouring countries and, above all, search for symbols of historical oppression. They are all evidence of the desperate search for alibis of a weak case, rather than of the strength of a powerful force. So that, while such symbols in India's ancient civilisation may be relatively easy to discover, or invent, as credible issues through which to derive durable electoral dividends, their significance could be easily exaggerated.

Even on the Ayodhya dispute, given the historical legitimacy of the Hindu-Muslim divide in the subcontinent, continuously reinforced by Indo-Pakistan tensions, it is not unlikely that a relatively large section of Hindus may have been generally sympathetic to the BJP's version of the history of Ayodhya. But, surprisingly, according to an opinion poll, published in *Frontline* (May 25, June 7, 1991) immediately before the general elections, only 43 per cent respondents supported the BJP/VHP stance on Ayodhya, while 41 per cent opposed it; but more significantly, only 19.1 per cent voted for the BJP in the general elections immediately thereafter. This would substantiate our hypothesis that support to BJP's views on Ayodhya could not be coterminous with electoral support for the party, and, much less, a post-dated endorsement of the subsequent destruction of the mosque.

At any rate, BJP's 19.1 per cent votes would be as deceptive an indicator of the appeal of Hindutva in India in 1991, as much as its 7.4 per cent votes in 1984, or 11.4 per cent in 1989. In fact, in sharp contrast to the BJP claims, the 'Ayodhya/Communalism' issue did not even figure as a significant issue in the voting preference of a large proportion of voters in 1991. According to an opinion poll by MARG for *India Today* (May 31, 1991), in 1989, 1990, 1991, only 13 per cent, 11 per cent, and 15 per cent respectively of the respondents considered it to be the most important, compared to 44 per cent, 54 per cent, and 47 per cent who considered 'price rise' to be the most important in the corresponding years, and 'corruption' by 36 per cent, 25 per cent. So that, either as a reasonably reliable index

of the appeal of its ideology of Hindutva, or its stance on Ayodhya, BJP's best-ever election success in 1991, nowhere near a majority of the Hindu votes, remains empirically untenable. In fact, going by the media reaction to the destruction of the mosque, the BJP's electoral appeal could even have declined.

Such a possibility cannot be discounted because of other factors. Since the late 60s, because of the mushrooming proliferation of various ascriptive identities, along with Hindu-Muslim communal politics, all political parties have reoriented their electoral strategies to ensure that no party is able to derive any special advantage on this score. All political parties take into account considerations of religion, caste, language, etc, in their electoral strategies, along with the BJP, to ensure that the advantages of most such identities are either evened out or shared. So that the increasing salience of ascriptive identities in Indian democracy has been accompanied by a corresponding decrease in the electoral weightage of any single ascriptive identity, including Hindutva, at the national level. Over-indulgence with Hindutva, in India's multiple social plurality, has the potentials of a double-edged sword for the BJP; and after the incidents at Ayodhya, the BJP may find it difficult to underplay it even when in duress. It may be faced with such compulsions in the foreseeable future, as we would argue.

BJP's relative electoral success in 1991 could be explained by the domestic political conjuncture mentioned earlier, which, for the first time, changed the elite-perception of the BJP, on the eve of the elections, to a 'winnable' party, thereby, attracting free-floating vote-banks and funds. In fact, most general elections since 1971 have been won and lost on the basis of 'waves' created by floating vote-banks deserting 'sinking ships' and gravitating towards potential winners. The high-profile professionals from the civil services and the armed forces who switched loyalties with fanfare on the eve of the elections were no sudden converts to Hindutva, some of them had been the hand-picked favourites of the Nehru-Gandhi family in the past. Eminence, drawn from such social groups, had earlier opted for the Janata Party, or the SJP, on the basis of their perception of 'winnability', thereby, anticipating and augmenting the 'wave'.

Under the favourable conjuncture of circumstances of 1991, 19.1 per cent electoral support in the country does not make the BJP electorally invincible. If its relative success in 1991 is conjunctural, then a different conjuncture of electoral chemistry could dent BJP's image of 'winnability' to set off the reverse-flow of

funds and eminence to make it vulnerable. The response of the 'eminent citizens' of Bombay, particularly its top industrialists, whom the BJP has been wooing for sometime in the recent past, to the destruction of the mosque and the communal violence, could have already set off such a process. But the impact of the events on the electoral chemistry would depend upon how soon the members of parliament and the ruling party could be persuaded to risk their perks of office to renew their mandate.

Objectively, it suits the BJP to delay the elections, to cut its losses from the trauma of recent events. But a possible electoral reverse, for the BJP in the foreseeable future is unlikely to reverse the general trend of accretion of strength of communal politics in India around its multiple ascriptive identities. It would only help in further reducing the electoral potentials of any single ascriptive identity for any political party with stakes in capturing state-power at the national level. In the case of the BJP, it could generate compulsions in the direction of an operational dilution of the ideology of Hindutva, to accommodate the aspirations of other ascriptive identities. Straws in the wind, after the vandalism at Ayodhya, already suggest such a possibility. But if that takes place, the BJP in terms of its content, would not be strikingly different from the Congress, Janata Dal or many other parties, except for being more organised.

Such a possibility may now appear to be far-fetched, even wishful prophecy, largely because of the events around Ayodhya leading to the destruction of the Babri Masjid. The operational unity of aims and objectives within the Sangh Parivar around Ayodhya could have tended to mystify secular perceptions around a monolith, master-minding, planning and executing the vandalism and blowing hot and cold after the *fait accompli* as part of a pre-planned political drama. That the destruction of the mosque was unquestionably pre-planned lends credence to such a conspiracy theory. But careful scrutiny reveals possible caveats in such assumptions.

Firstly, while the leadership of the Parivar, as such, owes moral and political responsibility for both the destruction of the mosque and the communal violence, their political costs had to be exclusively borne by the BJP in terms of its loss of credibility for governance within its predominantly urban middle-class political base, as distinct from the social base of the VHP and the Bajrang Dal in the rural areas and in urban villages respectively. The violence in Bombay, particularly its swanky residential neighbourhoods, were also at the political cost of the BJP

by alienating the leaders of big business whom the party has been trying to woo in the recent past. No other constituent of the Parivar had to share the political costs. Such asymmetrical political costs of the recent events, among the various constituents of the Parivar were predictable long before the count-down of the demolition, and must have been obvious to the BJP leadership.

Secondly, the RSS, the VHP and the Bajrang Dal, with no visible stakes in electoral politics can afford to be ruthlessly self-righteous in whipping up Hindu communal passions, which, beyond a point, could cause diminishing returns in terms of electoral dividends for the BJP.

In the immediate aftermath of the destruction of the mosque, such divergent goals within the shared worldview of the Parivar manifested themselves in the eloquent silence of the leaders of the RSS and the VHP, including its sadhus and saints, the flamboyant rhetoric of Bal Thackeray, formally, only a neighbour of the Parivar, as apart from Advani's formal acceptance of moral responsibility and Vajpayee's remorse. The full evolution of such divergences appears to have been stalled in mid-stream by the politically counter-productive dismissal of the BJP-governments, arrest of the leaders of the Parivar and banning of the RSS. This may have enabled the Parivar to cut its losses by forcing its constituents to close their ranks in a crisis.

Such a hypothesis cannot be ruled out, because, in the past, such divergent goals of the present constituents of the Parivar, visibly manifested themselves in the political arena. For long, after the assassination of Gandhiji, the BJP disowned any links with the RSS in sharp contrast to their present publicised honeymoon within the Parivar. Similarly, the RSS had threatened to support Indira Gandhi, against the BJP, in the early-80s, the parleys breaking down not on principles but because of lack of mutual trust. As part of the Janata Party, the BJP had been a political ally of the Akalis, well beyond the scope of vedantic Hindutva.

As a national political party, axiomatically committed to the capture of state-power, it may be compelled in future to share it with other ascriptive identities—beyond Hindutva—that are simultaneously asserting themselves with increasing stridency for their share. In fact, as argued, that is among the few available options for the BJP at the national level. In such an eventuality, even as a dominant partner, the BJP would be compelled to climb a few pegs down the wrung of Hindutva, even at the cost of the RSS. Such a possibility seems to have been anticipated by the BJP in its new emphasis on

the idiom of 'positive secularism', as apart from Hindutva, to distinguish itself from its alleged 'pseudo-secularism' and 'minorityism'. The line of retreat from the Parivar or a negotiated consensus on Hindutva is unlikely to be totally closed by the BJP.

The reported entry of the Shiv Sena, formally outside the Parivar into the fray at Ayodhya and in the violence in Bombay and Surat, has made the Parivar more incongruous. Beyond Ayodhya, Shiv Sena's relations with the BJP and the Parivar is sharply antagonistic; simply as a regional activist wing of Hindutva, its political identity, *vis-a-vis* the BJP is at stake but, its regional chauvinistic appeal to underscore its autonomy, while undermining Hindutva, is also at the political cost of the BJP. That could explain Shiv Sena's long informal alliance with the Congress Party at the regional level.

The perception of the Sangh Parivar as a monolith, because of the present convergence of interests among groups with divergent goals within their shared Hindu communal worldview, seems unreal and in conformity with BJP's interests to perpetuate the myth of its continued winnability.

On its own organisational strength, as a political party, BJP has remained vulnerable because of its continued dependence overwhelmingly on the urban trading community, whose economic interests are difficult to reconcile with either big business, or working classes; it is less likely to be so in the new phase of structural adjustment. Such a social group is traditionally susceptible to communal propaganda, but its business interests are directly affected by violence of any variety. BJP's culpability in stoking the present round of violence is unlikely to go down very well with such a social group of electoral weathercocks. Besides, wielding power in some states in recent times, it has accumulated its share of fat at all levels of its organisation, with its links with the criminal underworld, the NRIs, the bureaucracy and the coercive apparatus, like most other parties in contemporary India's politics of anomie. But unlike other parties, the BJP has depended in recent times on elemental passions that are relatively easy to arouse but difficult to be put under the lid; it is perennially faced with Frankenstein's monsters, like Indira Gandhi discovered at the cost of her life in Punjab. In the next electoral battle, the BJP would be faced with its monsters from inside the Parivar demanding their pound of flesh from the spoils of Ayodhya, while facing its adversaries outside. It is not going to be easy for the BJP to perpetuate its image of winnability,

unless helped by the lapses of its adversaries.

BJP's actual role—as distinct from its undoubted political responsibility—in the present round of communal violence in the country is strictly an empirical question. But, as we would argue, not particularly important for an assessment of the strength of Hindu communalism in general, or the BJP in particular, and much less for purposes of prescriptive formulations to contain communal violence in India. But to the extent that communal violence stokes communal politics, in a dialectical sense, it may help to have a closer look at some of the axiomatic assumptions about their linkages, to be able to relate them to the present events.

Firstly, the generic concept of communal violence continues to be used too ambiguously to describe many diverse types of violence. For example, the communal violence in 1984 was simply a case of one political party's violence against a community; the communal violence in Meerut (1967), Karimganj (1968), or in recent times in Meerut, Ahmedabad, Bhiwandi were between two communities. Most cases of communal violence in UP and Bihar have been between the police and the minorities. In Punjab, Kashmir, Assam and the north-east, communal violence has been of a significantly different nature. Besides there has been communal violence among trading communities, builders, landlords, tenants, against unauthorised encroachers and among working classes and within the underworld. Most communal violence, even when between two distinctively identifiable ascriptive identities, has involved equally distinct interest-groups, often predominantly so. Under such circumstances, violence is communal only in an extremely limited sense.

The present round of communal violence, all obviously sparked off by the events at Ayodhya also had its targets around other identities beyond the apparently ascriptive ones. They could provide an opportunity for exploring the influence of alternative, or parallel, continuum within the increasing level of general violence in society with the recent manifestations of communal violence. The violence in Bombay, including its upper-class residential areas, or in Surat, Ahmedabad, Delhi, etc, may have all been communal violence in a generic sense, yet may be significantly asymmetrical in terms of local specificities, including interest-groups. The present secular assumptions of communal violence, in a nexus of linear continuity with communal politics, appears too deterministic and rooted in the realities of the secular political alliance of the late 60s, possibly,

more relevant in the historical context of Indian politics till then. But since then, communal violence, even in its generic sense mentioned earlier, has been accompanied by violence among many other forms of ascriptive identities to suggest the possibility of a parallel, or alternative, nexus between communal violence and the general level of violence within the political system.

Such an alternative continuum remains mystified within mainstream secular discourse because of an implicit assumption of a normative hierarchy in the violence among various ascriptive identities, in which, the Hindu-Muslim divide assumes primacy. To the extent of its historical significance and its scope involving two major ascriptive identities, such a hierarchy may be legitimate. But in terms of dimensions of such violence, brutality, human casualties, recurrence, or their impact on the democratic system, such an implicit normative hierarchy appears to be somewhat arbitrary; and, rooted more in history than contemporary reality. Mainstream secular discourse, within its deterministic assumptions, ignores the possibility of alternative policy-options directed at containing communal violence within the continuing reality of multiple versions of communal politics. It refuses to squarely face the important question: could communal violence be eliminated in a violent polity that is socially plural in its ascriptive identities? Or, its flipside: could communal politics be institutionally insulated from violence? Such questions have more relevance within our framework for our assessment of the present phase of Hindu communal politics and of communal violence, than the actual role of specific parties in such violence.

Empirically, the close temporal and spatial correspondence between the general increase in the level of violence within the political system as a direct consequence of the increasing dent in the professional autonomy of the democratic institutions of conflict-resolution, and the assertion of various revivalist identities, could be substantiated. The first major Hindu-Muslim communal violence (Jamshedpur/Calcutta), relatively insulated from the politics of Partition, erupted in 1964, coinciding with the first significant dent in the institutional functioning of the ruling Congress Party usurped by the 'syndicate' with its members' political base in various regional ascriptive identities. While the next such violence (1965) sparked off by the Hazratbal incident could be attributed to Indo-Pakistan relations, the subsequent round of such violence, in Meerut (1967), Karimganj/Ahmedabad (1968), coincided with the orchestrated split in the Congress Party, and Indira Gandhi's assertion of

authority through the asynchronism of a coterie of 'committed' bureaucracy, judiciary, media, and scientific institutions. This was also the phase in which the SVD/BLD-type coalition of various caste-identities in north India emerged to supplement the Shiv Sena, dalit, nadar, ezhava, Muslim League, Jharkhand, as also new tribal identities in the north-east, in the political arena. Since then, particularly since the orchestrated and comprehensive assault on the autonomy of democratic institutions in the emergency, many new identities, or existing ones in new forms, politically have asserted themselves with increasing stridency. Such assertions of identities have been predictably accompanied by much violence around them. The same period has also been marked by increasing recurrence of Hindu-Muslim communal violence in its many variations within the generic version. More significantly, depending upon demographic variations, regions susceptible to violence around any ascriptive identity have also been prone to violence around other identities, including Hindu-Muslim violence and as brutal. For example, in Delhi, in terms of content of violence, the anti-Sikh violence of 1984, the Mandal violence of 1990 and the present round of communal violence are in many ways comparable, except in terms of their respective targets. It would be as arbitrary to normatively distinguish between these instances of violence, as it would be between them and the Shiv Sena violence against the south Indians in the earlier phase and against Muslims and non-Maharashtrians in the recent phase; or, the Assamese violence against Bengalis to begin with, followed by more selective violence against Muslim-Bengalis; or the DMK-led anti-brahmin and anti-Hindi/north Indian violence; or, between any of them and the violence in Belchi, central Bihar, Telengana, Jharkhand, Darjeeling, Nelli and, arguably, in the north-east, Punjab and Kashmir.

Similarly, to the extent that the coercion of the police and paramilitary organisations is encompassed within the generic concept of communal violence, as it also manifested in some areas in the recent phase, they have been as brutal and recurrent against other ascriptive identities, particularly against the dalits, tribals and the OBCs. In many parts of India, like Bihar, Andhra Pradesh, Madhya Pradesh, or the north-east, leaving out Punjab and Kashmir, the socio-political network which perpetuates such violence through the coercive institutions of the state is not strikingly asymmetrical to those periodically against the Muslims. Bhagalpur, Baghat, or the murder of Dr Ramanathan and Shankar Guha Niyogi, may have been

the more sensational examples of such violence, but they continue to be an abiding existential reality in the present phase of the political system, but still outside the orthodox secular discourse on communal violence.

This insensitivity of secular discourse and the increase in the level of social violence could explain the secular parties' passive endorsement of social violence by a corresponding accretion in the coercive power of the state. For example, since the Emergency, the phase of the quantum-jump in the recurrence and brutality of all forms of social violence has also been the period of new repressive legislations, like MISA, COFEPOSA, NSA, TADA, along with the old ones like the Disturbed Areas Act; new coercive instruments, like CISF, BSF, ITBF, Black Cat, RAF and RAW, along with all the old ones; increasing resort to executive ordinances; recurrent use of military and paramilitary forces in civil strife. It has been left to the civil and democratic rights groups, autonomous from the secular parties, to underscore the increasing role of state coercion in stoking social violence. A brutalised coercive machinery, reinforced with increasing authority, is unlikely to distinguish between its targets in any abiding sense. It is this creeping subterranean de-liberalisation of the political system, initiated by the politically orchestrated atrophy of its democratic instruments of conflict-resolution, and, consequently, increasing resort to coercive instruments of state-power to resolve social conflicts, that have stoked all forms of violence, including Hindu-Muslim violence in its multiple variations. This process of de-liberalisation may not be visible at the surface because of the uninterrupted process of periodic elections in India's democracy.

For example, given the well known professional inefficiency of almost all institutions of governance, particularly the coercive apparatus specially designed against violence, their manifestly partisan social and political bias invariably tilted in favour of the 'winning horse', it is no big deal for any individual or group—and much less for a political party—to trigger off a communal violence of one form or the other. It would be a deceptive indicator of the organisational strength or ideological appeal of any party. In fact, a relatively more dependable index could be its reverse: a party's ability to contain such violence within the limits of its political advantage. By such a criterion, the BJP's strength as manifested in the recent events appears less intimidating than it appears to be in mainstream secular discourse.

In fact, the dysfunctional legal system has already transformed violence into a soft option to enforce private justice. An enormous constituency of vested interests, drawn from almost all socio-economic strata and India's multiple ascriptive identities, has emerged within the political system with stakes in periodic communal violence of one variety or the other, depending on their specific needs. Even in the recent round, one such incident in Delhi, in a curfew-bound locality of predominantly Muslim residents, was reportedly triggered off by gamblers who had betted heavily on the possibility of communal violence and were about to lose. The role of the drug-mafia in stoking Sikh communal violence is well known. In the anti-Sikh violence in Delhi (1984), communal abetment of a section of the police was also an unfortunate response against the manipulation of a senior officer with high political links in recruitment and postings in the Delhi police. Such responses to similar manipulations have so often led to campus violence on communal lines. Even leaders of parties committed to secularism or of minority-groups and aspirants for such leadership have developed a stake in the soft option of periodic communal violence, to prove their respective points to different target-groups. In two of the most brutal incidents of communal violence in recent times—against the Sikhs, and against 'Mandalisation'—the BJP was not involved in any significant sense. Just as communalisation of politics and its criminalisation have encouraged most parties into the game, the politicisation of social violence has led almost all parties into it, often as deterrence, but as often for first-strike.

Contemporary secular discourse remains impervious to this growing phenomenon, at its own cost. In its obsessive concern exclusively with the communal politics of manifestly communal parties as the main source of communal violence it has tended to ignore the larger structure of violence within the political system which enables all political parties and assorted groups to indulge in periodic violence of their own choice. This has helped communal politics without being of much help towards innovating policy-options to contain communal violence.

The present secular orthodoxy has unwittingly enabled Hindu communal ideology to underplay the weakest point of its ideological thrust of Hindutva: the danger it poses to India's liberal democracy which remains a structural imperative of the political system within its inherited territorial configuration and demographic dispersal of ascriptive identities. A constitutionally guaranteed struc-

ture of equal rights of citizenship, irrespective of any ascriptive identity, constitutes the core-concern of liberal value, as also the main institutional foil against the endemic potentials of all democracies towards 'majority tyranny' and/or 'executive authoritarianism'. The ideology of Hindutva, by discriminating between citizens' rights, undermines the liberal core and, consequently, augments the endemic proclivities of the democratic system towards such tyranny and authoritarianism, and in the process, poses a threat to India's present territorial integrity. In other words, democracy postulating majority rule through periodic elections is a necessary but not sufficient condition for a liberal democracy, which postulates equal rights of citizenship that is critical for the territorial integrity of a plural society. Hindu communal politics with its majoritarian thrust has selected only one divide within India's multiple plural identities which, for historical reasons, is to its advantage. The present secular discourse, by its assumption of the primacy of this divide, has helped only to complement it, to the advantage of Hindu communal politics.

Consequently, secular discourse has been enticed into the terrain of history, anthropology and theology, which, in a civilisation with a long continuous history, has provided enough grist to the mill of communal ideology to engage it in a zero sum game of myths and folklore. In the process, secular discourse has been intellectually chained around the normative concerns of an ideal society to tail communal ideology on the latter's opted terrain and terms. At the theological plane, it is perfectly conceivable for communal ideologies to provide alternative norms of an ideal society that could be historically and anthropologically proved to be relevant for pluralist democracies. Secular ideology, particularly its most evolved operational version in the western industrial societies, or its distorted version in India, cannot lay any moral claim to monopoly over such norms. With its inadequacies, orthodox secular discourse, now appropriated by a new generation of India's precociously post-modern urban middle-class, appears, from the correspondence columns of the print media, to be re-enacting a caricatured version of the tradition-modernity debate of the 19th century, to the advantage of communal ideology in India's predominantly traditional society.

Secular discourse needs to be anchored within the primary concerns of political science around the nature of the state in a plural society and, more specifically, of liberal democracy as a structural imperative of India's territorial integrity. This might help in providing the cutting edge

to secular discourse, and make it politically more viable in its present confrontation with communal politics and communal ideology. It might also help secular discourse to correct its own inadequacies on the problem of communal violence. Even if the line of argument presented in this analysis is unconvincing, there is obviously something amiss in the understanding of the problem of communal violence within present secular discourse. For, its holistic approach of containing communal violence by a political confrontation with communal politics has till now been counter-productive; while communal politics has gained strength, communal violence has been more frequent and increasingly brutal. It may help to explore possibilities of alternative minimalist policy-options to contain communal violence in spite of continued communal politics. Already the vicious circle of violence and de-liberalisation of the political system poses a threat to the democratic structure and in territorial integrity, without Hindutva ever wielding state-power at the national level; and the consequent secessionist threats while benefiting Hindutva have certainly not been created by them.

Our plea for a shift in the concerns of secular discourse to the structural correlates of liberal democracy is based both on Indian experience as well as other comparable experiences particularly in the post-colonial world, some of which could be generalised: Firstly, the dialectical link between liberal democracy and the secular state, in the absence of any revolutionary options; and secondly, the counter-productive consequences of any open confrontation with communal ideology, in which, Gandhiji's experience is only the more dramatic of numerous such examples. Secular ideals have best survived as an appendage to ideologies of liberation, either within the liberal democratic framework or revolutionary alternatives. Thirdly, repression is counter-productive against all ideologies, including the communal ideology. In India too, secularism originally remained an implicit axiomatic corollary of liberal democracy in the Republican constitution which enshrined the quintessential secular goal of equal rights of citizenship. It was only during the most orchestrated onslaught against liberal democracy in the Emergency era that secularism was pirated into the Constitution explicitly in the Preamble by the subterfuge of the 42nd Amendment, thereby, undermining the moral and political legitimacy of secular appeal; repression of the Emergency dented it further. Consequently, the erstwhile BJP, as the main victim of secular repression in the electoral fray benefited in 1977. Since then the direct positive correlation between

political deliberation and communal politics and violence have been underscored. These experiences could provide the broad parameters for policy-options to challenge communal politics and contain violence.

Within these parameters, three macro-level policy-options seem to emerge. Firstly, defence of the Republican Constitution, particularly the chapters on Fundamental Rights and the Directive Principles of state policy. Secondly, measures to ensure the professional autonomy of democratic institutions, particularly the coercive apparatus, along with institutionalised mechanism of their accountability; drastic reform of the legal system to ensure cheaper and quicker justice. Thirdly, reinforcement of the civil and democratic rights movement, insulated from electoral politics, as an effective watch-dog against the system's proclivity to 'majority tyranny' and 'executive authoritarianism'.

Meanwhile secular discourse ought to shift its concern towards widening the social base of democratic consciousness, which, in the ultimate analysis, could be the only viable foil against the proclivities of the democratic system towards tyranny and authoritarianism, with or without the BJP in power. Till now, such threats within the system have been posed almost exclusively by parties committed to secularism. It is unlikely to be worse under the BJP.

It seems, in the absence of any revolutionary options—ideological or operational—the residual radical option in the present phase of India's post-colonial democracy is a reassertion or old-fashioned liberal values. That could also be the most viable secular politics against the challenge of communalism, as also to contain communal violence in spite of communal politics. But as part of the liberal bandwagon of secular discourse, secular activism cannot afford the luxury of reciprocating the flamboyance of the communal rhetoric which thrives off elemental passions in any extremist political ambience, as opposed to secular rationality involving the values of reason, restraint, and tolerance of alternative world-views.

Shelter, Women and Development

In the paper 'Shelter, Women and Development: Beating a Path towards Women's Participation' by Meera Bapat and Sheela Patel (*EPW*, March 13), acknowledgement of the fact that the paper had been presented at a conference held at the University of Michigan, Ann Arbor, USA, between May 7 and 9, 1992 was inadvertently left out. The omission is regretted.

Ed.

Speech made by the Chairman
at the 13th Annual General Meeting

Ladies & Gentlemen,

I have great pleasure in extending a warm welcome to all of you at the 13th Annual General Meeting of the company. The abridged accounts along with the Director's and Auditor's Reports have been with you for quite some time. I would now like to lay on the table of the house the full accounts for the year ended December 31, 1992.

1992 in retrospect

I do not need to recall the dramatic events that were witnessed by the country in 1992 and early part of this year. Needless to say these events have left an indelible impact on both the economy and the social fabric of this country. Nevertheless I must state here that both the economy and the people seem to have an inherent resilience to withstand shocks that have been imposed by such events. Such events coupled with the recessionary trends in some of the key sectors of the economy and non-appreciation by the players in the stock markets of the long term benefits of the measures introduced by the Government of India have led to a downturn in the stock markets as well as in the primary markets. I am pleased to state that the performance of your company despite these adverse circumstances has been quite good.

In the financial year 1992 your company has registered growth rates of about 35% in gross income, gross profits and gross financial assets. I would like to add here that the average annual compounded growth rate over the decade has also been ranging from 35% to 40% every year. Such an achievement has only been possible due to a process of continuous adapting by your company to the changing circumstances in both the economy and the market place.

I am sure you are all aware of the fact that the financial services industry is undergoing a transformation with the various liberalisation measures introduced by the

Government and the Reserve Bank of India. The last two years have witnessed the entry of a large number of players into the market including the large industrial houses. Such a phenomenon was last seen in the early 80s when everyone was talking about the mushroom growth of leasing companies. The current trend is qualitatively different since the entrants are from large industrial houses and in an environment where the private sector financial service companies are being viewed in a more favourable context. Further, the market liberalisation has certainly opened up a more competitive environment as compared to the last decade.

Despite the above, I am quite confident that given the large and well established base in leasing and consumer finance and the additional thrust towards merchant banking and OTC operations, your company will continue to grow and be at the forefront.

The future

I am pleased to inform you that your company has been authorised by SEBI as a sponsor for a mutual fund. The regulations prescribed by SEBI involve setting up the mutual fund management company as an independent entity. This will necessarily mean that a separate Asset Management Company has to be set up, with your company as the sponsor and promoter with other institutions and bodies involved in the entire mutual fund operations. The company has made significant progress in complying with the various regulatory requirements.

The Reserve Bank of India has already announced the guidelines for setting up new banks and some amendments and modifications to these guidelines are in the pipeline. Your company has already submitted an application to the Reserve Bank of India and our approach to setting up a bank will be with caution and due diligence.

The Government of India has amended the Securities Contract Regulations Act to permit corporate membership of stock exchanges within a limited liability structure. I understand that both Securities Exchange Board of India and Stock Exchange are in the

process of formulating the guidelines for such corporate membership. The guidelines will be released very shortly. On your company's application, your company would be eligible for such membership.

Given, the above, you expect to be in a position to set up mutual fund operations in the next year and depending on the regulatory approvals, the price of your corporate stock may go up in the next year.

Apart from the above, looking at other products, the drawing board is open over the years. However, it is clear in our mind that the group is moving forward due to the rules and regulations prescribed, each of these projects may be set up as a legal entity with a promoter and with a management team. It also involves participation of institutions as co-promoters as in the case of mutual funds. Through such partnerships, we will be building up strong segments of the financial services industry. We will achieve synergy between the products offered by the

Chairman, Mr Davendra Ahuja,
Annual General Meeting

formulating their own guidelines
porate memberships. As per
reports the guidelines are expected
ed very shortly for such corporate
s. On issuance of such guidelines
ny would be making the necessary

ffered by the group as a whole.

Policy Issues

The various policy measures that have been initiated by Reserve Bank of India and Government of India have had a positive impact on the financial services sector especially in terms of permitting entry of private sector into certain segments of this market which were, till now, exclusively reserved for the public sector. I am sure that in the near future other segments of this market would also be opened up to private sector finance companies. The Government has also stated that it would be creating a level playing field over the years for all the players in the market. Such measures, while certainly increasing competition will also open up new avenues for growth. However it should be recognised that the present public sector financial institutions and banks would continue to have a strong position in the market even after the ownership pattern changes through the privatisation process which has already been initiated. In such a scenario, market/product segmentation should take place with a few large national players in all market/product segments, with niche market players offering specialised products and services and small players in the regional markets. There would also be companies which have significant presence across all product markets and geographical segments competing on the basis of quality of product and services, while carving out certain segments for themselves. I visualise 20th Century positioning itself in this particular segment of the market offering a wide range of financial products coupled with high quality service to all its clientele.

Another area I would like to touch upon is the recent amendment to RBI directions in respect of public deposits for non-banking financial companies. Some of these amendments relating to intercorporate deposits and debentures are more restrictive than the earlier position. However there have been recent press announcements that RBI is in the process of reviewing these provisions and appropriate modifications will be made. I am also confident that in line with the recommendations of the Shah Committee, RBI will be focussing on the asset side of the non-banking financial companies with

guidelines being prescribed for capital adequacy equivalent to those prescribed for the banks and leave the liability management to finance companies within broad policy parameters. Such a focus along with the provisions for registration with RBI will certainly help in further development of the public deposit market with adequate investor protection.

Statements have been made in the past that financial institutions whether in the private sector or in the public sector by their very nature and operations have an obligation to conform to public policy and work in partnership with government. I would entirely concur with the sentiments expressed by such statements but there is certainly a need to create a forum for interaction between the Government and the financial institutions both in the private and public sector. In fact with the creation of level playing field and the process of privatisation of the public sector, the distinction between the private sector and the public sector should gradually vanish. In such a scenario, setting up of such a forum for interaction with the Government, bringing together under one umbrella the entire financial services sector should not be difficult and can be done with the co-operation of all the parties involved. I am quite confident that 20th Century will play its due role in this process and will continue to be a significant player in the market with growth being achieved in various product segments of the company over the years.

Finally, I would like to thank my colleagues on the Board, staff members, the shareholders, debenture holders, depositors, the banks and the financial institutions for their valuable support.

Sustainable Mountain Agriculture Beyond a 'Mountain Perspective'

R Maria Saleth

Sustainable Mountain Agriculture edited by N S Jodha, M Banskota and Tej Partap; Oxford and IBH Publishing Co, New Delhi, 1992; two volumes, pp xv + 807, Rs 795.

ALTHOUGH it is generally believed by many that the concept of sustainable development (SD) entered into the political etymology only after the seminal publication of the report *Our Common Future* by the World Commission on Environment and Development in 1987, it was originally proposed much earlier in the report *World Conservation Strategy: Living Resource Conservation for Sustainable Development* prepared jointly by the World Conservation Union, United Nations Environment Programme and World Wide Fund for Nature in 1980. Despite being written so much over the years, confusion continues to persist as to what SD means in an operational and policy context. But what is surprising is that, in spite of so many still unresolved conceptual and operational problems, there has been a systematic effort by a number of international organisations, including the World Bank, to search for a unique recipe for achieving SD everywhere!

Most of the conceptual confusion and operational difficulties related to SD could be eliminated provided one recognises the full import of the following five propositions about SD. First, since SD is a multi-dimensional concept with three critically interacting dimensions—ecology, economics and ethics—the necessary conditions for achieving SD are: ecological security, economic efficiency and social equity. This proposition underlines that SD does not end with the sustainability of just the environment and resource system but requires the sustainability also of the economic and social systems. Second, SD is a relative concept both in time and space. Absolute sustainability even where it is possible to identify (e.g. groundwater use policy based on annual aquifer recharge) is of little practical relevance except to serve as a yardstick to evaluate the extent of deviation of the current pattern of resource use. Third, SD is contextual both in time and space. That is, what is considered sustainable in a given region/ecosystem/time need not be sustainable in another region/ecosystem/time. The contextual nature of SD precludes the possibility of identifying a unique recipe for SD applicable everywhere and at every time. Fourth, SD is a hierar-

chical and interrelated process where the past, present and future sustainability of households, villages, nations and the planet itself is inter-linked. Consequently, it is not possible to achieve sustainability at one level without achieving it at other levels. And fifth, although SD should be defined and measured in the bio-physical domain rather than in the economic domain in view of the inability of the current market to reflect future preferences and options, the criteria driving those physical measures should necessarily be based on economic efficiency and social equity considerations.

The above five propositions taken together could provide a very useful methodological framework for operationalising the concept of SD in a practical context. This framework is used here to evaluate the conceptual, methodological and empirical contributions of the book under review to our understanding of SD within the particular context of mountain agriculture.

The two volume book edited by Jodha, Banskota and Partap with a foreword from Gordon Conway is a compilation of papers presented at the International Symposium for Strategies on Sustainable Mountain Agriculture held at Kathmandu, Nepal, during September 10-14, 1990. In addition to the conference papers, a few papers reporting relevant research work of the International Centre for Integrated Mountain Development, Kathmandu, which hosted the symposium are also included. The 33 chapters in the two volumes contributed by some 46 authors, including the editors themselves, are organised into five parts in terms of their thematic focus. Volume one containing 15 chapters arranged in three parts deals with the conceptual and operational aspects of SD as well as certain common strategies and perspectives essential for its achievement in the context of mountain agriculture. Volume two containing 18 chapters grouped into two parts highlights the grassroots level experiences and success stories as well as institutional and technological innovations necessary to promote sustainable mountain agriculture. Although a great majority of the papers represent the experience in countries hav-

ing areas located in the Hindu Kush-Himalayan (HKH) region like India, Pakistan, Nepal, Bhutan and China, there are also a few papers reporting on the sustainability concerns of mountain agriculture in the Andean region of South America.

USE OF MP-SF

Part one comprising six chapters focuses on the perspectives and approaches considered essential for the evaluation of the sustainability status of mountain agricultural systems. In the introductory chapter, the editors provide a cryptic overview of the issues and themes covered in the book. There is also an attempt to analyse and synthesise the contributions of individual chapters especially in terms of both micro and macro strategies and approaches for sustainable mountain agriculture. Chapter two contributed by Jodha where the so-called 'mountain perspective-sustainability framework' (MP-SF) is elaborated assumes critical significance as MP-SF has been extensively used throughout the book as a tool for evaluating the sustainability implications of various development interventions, macro-economic policies and institutional and technological options.

The MP-SF stipulates the explicit or implicit incorporation of the operational implications of mountain specificities, i.e. inaccessibility, fragility, marginality, diversity/heterogeneity, niche or comparative advantage, and human adaptation mechanisms when designing and implementing development policies and programmes in mountain habitats. The six mountain specificities are not independent but inter-linked in view of the commonality of causative factors and shared consequences or mutual externalities. The operational significance of the mountain specificities emerges from the fact that they specify not only the potentials and constraints but also the evolution of dependent patterns of activities. Under MP-SF, the negative changes in terms of lower productivity and resource degradations currently evident in mountain agriculture are traced to the failure of the conventional development paradigms to incorporate in them the operational implications of mountain specificities. Approaching sustainability via unsustainability and using the variables reflecting the negative changes in resource base, resource use, production flows and management practices, Jodha has also identified a set of 'indicators of unsustainability'.

While chapter three provides a comparative picture of mountain agricultural development strategies in the HKH

region, chapter four describes the development strategies in the Andean region. An analysis of development experiences of these regions in the four areas of public policy, i.e. nature of investments, management and decision-making, major thrust in sectoral programmes, and public service support is provided to show that the missing component in these policies is the mountain perspective. The next two chapters evaluate the response of farmers to the development policies and programmes in the HKH region in general and Nepal in particular. Special emphasis has been given to the way farmers adapt themselves to various mountain specificities. The upshot of the analysis is that while farmers' strategies vividly reflect their recognition of mountain specificities, government policies, on the other hand, display a neglect of the imperatives of the mountain perspective.

POPULATION DYNAMICS

Part two with six chapters revolves around certain macro issues affecting the long-term sustainability of mountain agriculture such as population growth, macro-economic policies, institutional and infrastructural requirements and biodiversity. Given the resource base and its productivity in a given region of eco-zone, the population dynamics determine actually the carrying capacity of the system. Mountain specificities influence population growth and hence the carrying capacity. For instance, fragility and diversity require a labour-intensive production pattern leading to the preference for a larger family. Therefore, conventional population control measures will not work in mountain regions. To stabilise mountain populations what we need instead is a rapid economic transformation through mountain perspective-based macro-economic policies, including the policy of relocating part of the mountain population in the plains and urban centres. From an operational point of view, the incorporation of the mountain perspective basically translates into the need for both tailoring the macro-economic policies to reflect the potentials and constraints presented by the mountain environment as well as a radical modification of current project evaluation techniques including the cost-benefit approach.

While chapter nine evaluates the sustainability implications of induced institutional innovations like the Sukhomajri experiment in Haryana, Dhading Development Project in Nepal, and the Contractual Responsibility System in the Miyi county of China, chapter 10 outlines the implications of physical infrastructures for human resource development, technology transfer, new markets, and capital formation in the particular context of two mountain districts of Nepal.

Chapter 11 that elaborates on the four-dimensional nature of mountain agriculture (i.e. elevation, latitude, longitude, and culture) makes an interesting attempt to fit various mountain agricultural systems spread around the world into five idealised models defined in terms of economic focus, population level, land-use, and cultural factors. The implications of biodiversity which is slated to be responsible for the emergence of mountain specificities themselves are discussed in the final chapter of part two. In order to counter the detrimental effects of the loss of bio-diversity caused by economic, demographic, institutional and technological factors, it is suggested to shift the emphasis from the sustainability of particular resources to that of the mountain ecosystem as a whole.

The three chapters included in part three empirically illustrate the utility and significance of some analytical methods and planning techniques useful for designing sustainable mountain agriculture. While chapters 13 and 14 describe in technical detail the derivation of finer agro-climatic zones for Nepal based on a set of bio-climatic variables, chapter 15 demonstrates, in the context of Sindhupalchok zone of Nepal, how the technique of Geographic Information System could be used to derive indicators of unsustainability. The most pertinent contribution of the latter chapter is that the nine politico-administrative units of the Sindhupalchok zone are ranked by their relative unsustainability status in terms of the indicators of unsustainability like food security, nutritional status, landholding size, and livestock per capita. The policy significance of this approach is that the unsustainability ranking established through economic, equity and resource criteria could guide policy-makers not only in establishing regional priority but also identifying regional-specific programmes and their target groups.

FARMERS' STRATEGIES

Part four with nine chapters concentrates on the sustainability implications of mountain farmers' strategies. The lead chapter here presents a so-called 4-S model (i.e. space, season, sector and society(?)) to explain the technology choice of farmers. Since farmers' search for innovations is a set of continuous events rather than discrete events or accidents, an effective diffusion of innovations among farmers requires repeated experimentation, improvisation, and adaptation to ensure individual and collective feedbacks. The ignorance of this fact explains why current technology diffusion models have failed to register the required magnitude of impact. The remaining eight chapters of part four discuss the practical strategies of mountain farmers observed both in the

HKH and Andean regions. Understandably, the nature of strategies differs across different farming systems within the mountain agriculture so as to cope most effectively with the specific constraints and potentials presented by mountain specificities. All the chapters in part four are unanimous in emphasising the critical need for reviving traditional resource management systems and indigenous institutions to promote sustainability. Moreover, understanding the rationale behind these systems could provide clues for the identification and introduction of the right kind of modern technologies and institutions.

The broad focus of part five containing the last nine chapters of the book is on some of the successful and innovative approaches and experiments found to induce desirable economic transformation in the mountain areas of the HKH region. They cover the anti-poverty-focused and local-resource-centred programmes in China, area-based integrated development strategy in India, technology diffusion and institutional initiatives in Nepal and agricultural research and village management systems in Pakistan. These success stories are essentially case studies of hope for the sustainability of mountain agriculture. However, since their success depends upon specific local circumstances, the potential for replicating these experiments elsewhere in other mountain regions is severely circumscribed. For instance, the success of the area-based horticulture-led development strategy of Himachal Pradesh in India is mainly due to the powerful stimulus given by the hinterland demand for horticultural products. Such a strategy may not be relevant for Nepal and Bhutan lacking vast hinterlands. Similarly, the success of the Chinese experiment is largely due to the introduction of private incentives which were conspicuous by their absence earlier.

While the policy significance of the MP-SF proposed and extensively used in this book cannot be underestimated, one cannot resist questioning the attempt to elevate an analytical tool to an evaluation technique. Our five propositions about SD advanced earlier clearly show that the mountain perspective based on the six mountain specificities provides only a contextual framework for the evaluation of sustainability, not an evaluation methodology which is 'of course' extraneous to the mountain perspective *per se*. To be fair, most of our propositions are either recognised or implied in the MP-SF methodology, though they have not been integrated systematically. In our view, a more rational and practical approach will be that given the implications of the mountain specificities of a given region or ecosystem, the ecological, economic and equity effects—visible, concealed and potential—of various policies

and programmes as well as different land-use patterns, crop technologies and institutions should be evaluated in terms of suitably designed variables reflecting those effects in a measurable form. Since this approach has the capacity to rank various policies, programmes, projects and even different regions and agro-ecosystems in a relative context, it has the practical relevance for identifying regional-specific mix of programmes and also their target groups. In this respect, we reiterate that the indicators of unsustainability will be appealing only in a relative context as has been demonstrated in chapter 15.

REGION-SPECIFIC APPROACH

Despite the fact that the evaluation methodological requires improvement, the central message of the book is very clear. Development policies and programmes currently being implemented in the mountain areas are alien to the sustainability requirements of mountain agriculture insofar as they are based on models suitable mainly to plain regions. Since these programmes have failed to incorporate the mountain perspective both at their formulation and implementation stages, they do not often get tailored to fit the specific constraints and potentials presented by the mountain ecosystems. When macro-level policies implemented from above failed to arrest the erosion of the resource base of mountain agriculture, grassroots level programmes centred on farmers' indigenous technologies and institutions have been greatly successful in promoting mountain agricultural sustainability. This suggests the critical need to look for regional-specific strategies to address micro-level environmental, economic, and social requirements. Although specific policy options do vary across regions and agro-ecosystem, the book suggests a general approach, i.e., a resource and area-centred integrated development involving a two-way adaptation where mountain specificities are adapted to suit production activities and the latter, in turn, are designed to fit within the potentials and constraints of the former. The identified policy prescriptions for such an integrated approach to mountain development are: fuller utilisation of the inter-linkages both within and between various farm and non-farm production activities and inter-regional linkages both within and across mountain regions, demand-side management, judicious blending of traditional and modern technologies and institutions.

Regarding its empirical contributions, the book abounds with very detailed documentation of field level observations of farmers' strategies and development experiences obtained in the context of the two of the most important mountain agricultural systems in the world. Despite some methodological problems with the MP-SF, the analytical and policy contribu-

tions of the book are truly immense. The book is a definite success not only in driving home the need for a radical transformation of conventional development paradigms but also in providing a detailed alternative approach for mountain agricultural development. This well edited book with comprehensive regional and thematic coverage and complete cross-references to its chapters contains a detailed bibliography and information on almost all aspects of mountain agricultural sustainability. The index at the end will be very helpful in guiding readers through the book. Although conferences

and symposiums continue to function as a spot market for the exchange of new ideas, recording and documenting the proceedings in the form of books could enlarge further the sphere of intellectual transactions both over time and space. While we are sure this compendium will have a warm reception from fellow researchers with an interest in sustainability in general and sustainability of mountain agriculture in particular, the book will realise its main purpose only when policy-makers in the realm of mountain development respond constructively to its central messages.

Malcolm's Travels

Harmala Gupta

The Autobiography of Malcolm X as told to Alex Haley; Ballantine Books, New York and Random House of Canada, Toronto; thirty-third printing, 1992.

WHEN Malcolm arrived in Saudi Arabia on the final leg of his Haj pilgrimage to the holy city of Mecca he found himself in a land he had never dreamed existed. He no longer stood out as a man of colour, any way there were too many colours here, but rather as an American brother who was to be helped, hosted and instructed along the way. The warm hospitality and the spontaneous affection he received from prince and pauper alike warmed his heart and changed his mind in a way that he had never thought possible. Here were people as white as the 'devils' back home and they loved and respected him! Was it possible after all to be white and yet not be a racist? And, more to the point, was Malcolm up to the challenge?

His subsequent thoughts, penned in a letter from Mecca, would prove he was: "Despite my firm convictions, I have been always a man who tries to face facts, and to accept the reality of life as new experience and new knowledge unfolds it. I have always kept an open mind, that is necessary to the flexibility that must go hand in hand with every form of intelligent search for truth" (p 340). Malcolm would also ruefully recall at this moment, as he would on numerous later occasions, with growing regret, the cutting rebuke he had administered in Harlem to a young white woman who had wanted to join his cause. For him she had then been beyond the pale.

Malcolm however continued to believe that if the whites in America wanted to sincerely fight racism they should do so in their own constituency, for that was where the problem lay, rather than cosy up to the blacks. He had nothing but contempt for those 'nigger lovers', as he called them, who hung around the blacks in Harlem and elsewhere. To quote him: "I

have these very deep feelings that white people who want to join black organisations are really just taking the escapist way to salve their consciences. By visibly hovering near us, they are 'proving' that they are 'with us'...Where the really sincere white people have got to do their 'proving' of themselves is not among the black victims, but out on the battle lines of where America's racism really is—and that's in their own home communities..." (p 376). A lesson that those who would fight the communal enemy today could well take.

Neither did Malcolm have warm feelings for the "token integrated" middle-class blacks (especially the preachers and PhDs) whose real profession he opined was to be a negro for the white man. These 'Uncle Toms' he felt had undermined the cause of the Afro-American by adopting the white man's standards of respectability and now shared his racist point of view as well *vis-a-vis* their less fortunate brethren. In India, today, the leadership of the minorities, in the main, it may be argued, fits this description well. He was however to modify his stance with regard to the value of the civil rights movement led by Martin Luther King and acknowledged that it may have a role to play in regions that had not experienced the full brunt of racism. He was quite sure though that it had no place in the ghettos of Harlem where the law of the jungle prevailed.

Malcolm's travels to Africa further cemented the change in his outlook.

It filled him with pride to see Africans running their own affairs and engaged in the most complex of tasks. He also met some whites here who were working in partnership with the local governments and populations. This gave him hope that if these African governments threw in their lot behind the cause of the Afro-American the American state would have

to respond if it wished to maintain its image in the international community. He no longer called for a separate state for blacks within America which had been an outcome of his earlier belief that racism could never be surmounted by individual whites. He believed now that it was a collective problem which had its roots in an exploitative system, and that sincere whites together with the blacks could work towards changing the system and thus combating racism.

It was a thoughtful and in many ways a wiser man who returned to the states after his sojourn abroad, where he had received wide acclaim and had been treated like a head of state. Even his conversion to Islam seemed to take on greater meaning. He realised that what Elijah Muhammad had propagated was a doctrine of racial intolerance that had nothing to do with the brotherhood of Islam. He now turned to scholars from the holy land itself, some of whom had associates in the states, who could instruct him properly in the faith.

The autobiography of Malcolm X is the tale of a man who since childhood found himself constantly engaged at home with forces that seemed to have only one purpose in mind—to keep him in his proper place, as a black man in America. Though, ironically, thanks to his mixed breeding, Malcolm was much lighter in complexion than any of his siblings and had red hair to boot. He was later to recall, with some guilt, that his lighter colouring had earned him a special place in his father's affections while it had the opposite effect on his mother, who could have passed off as a white woman. He was never dark enough for her. In time his red hair too was to become for him the mark of his shame. In Harlem, in the early years, however, it was the flag of his trade and earned him the nickname 'Red'.

While Malcolm's travels abroad were to serve as an eye-opener and were to change him in many ways, so did his earlier travels at home.

In prison, serving a sentence for armed robbery, Malcolm taught himself to read and soared on the pages of the books he read to many distant and exciting lands. It was a time of self-discovery for him as he read about his African heritage. At night, under the faint glow of the bulb hanging outside his prison-cell, he discovered that he was a real man, with an ancient past that he could be proud of! He was an African-American! Before long he would also be laying claim to an indigenous religion, that of Islam.

Malcolm's stay in prison was to free him in a manner he could never have imagined. For the next several years he was to barnstorm American campuses and black neighbourhoods taking everyone in his stride. This was the time when he helped the Black Muslim movement under the

leadership of Elijah Muhammad expand its membership and was instrumental in setting up several of its temples.

Unfortunately, however, as Malcolm's popularity grew so did the ranks of his detractors. Once again the little folks were busy tying him down.

For them his voice was just a little too loud, his manner just a little too insistent, while his face and his past could have done with less colour. They argued that he was a threat to America's innocents—the poor, the black and the young—and to the American way of life.

The battle for the minds, hearts and souls of Americans was heralded by the media and conducted in colleges and university campuses throughout America. The invitations came thick and fast and no stone was left unturned in revealing the nature of the beast in all his red hair, tooth and claws. They would, time and again, pit against this man of a single letter, their men of many letters, in black and white, hoping to show that the first and the last word belonged to them. What they had not bargained for however was the resilience and intelligence of the man. Not only was he able to successfully elude all their thrusts but he began to set the agenda as well. Thus, when they invited him to talk about race relations and black violence, he offered to state his views on the future of the American space programme, and other such esoteric subjects, considered the white man's preserve. He had what he referred to as a 'psychic radar' which enabled him to foresee his opponent moves well in advance and which helped him build his mass appeal. So they never really landed a satisfactory punch, that is, until Elijah Muhammad stepped in.

For some time Malcolm had been hearing some disconcerting stories about the private affairs of the Black Muslim leader which, as was his style, he was to confront him with. Elijah Muhammad sought to justify his transgressions of the flesh by referring to his special status as messenger of the most high. Neither man it seems went away fully convinced.

The moment of decision seemed to present itself with the assassination of president John F Kennedy when Malcolm, asked for a response to the incident by a reporter remarked that, "the chickens were coming home to roost". Almost immediately Elijah Muhammad disassociated himself, and the Black Muslim movement he led, 'The Nation of Islam', from the remark, and let it be known that Malcolm was no longer a welcome member and would have to show repentance before he could be forgiven and reinstated in any capacity.

It was an unfortunate, though not unexpected, blow for Malcolm who had worked tirelessly and selflessly for the Black Muslim cause in America and had

been its most sought after spokesperson. He believed that there was also an unwritten contract out to kill him. It seemed like a good time to travel. Before departing, however, Malcolm announced the formation of Muslim Mosque Inc made up of members of the Black Muslim movement who had chosen to throw in their lot with him. The new mosque, he explained, was to serve as "...the working base for an action programme designed to eliminate the political oppression, the economic exploitation, and the social degradation suffered daily by 22 million Afro-Americans". He had, therefore, it seemed not given up his belief that even as Islam had liberated his 'jungle' mind it would do the same for his fellow blacks.

When Malcolm returned from Hajj, and from his travels to Africa, he was, as we have already mentioned, a man with a different point of view. His statements abroad, as quoted in the American press, had already caused some consternation among his followers at home. He was greeted by a barrage of questions from reporters soon after touching American soil and reiterated what he had already said about having learnt a lesson in brotherhood. When his attention was drawn to the racial violence that had recently rocked some American inner-cities he declared that the Afro-American should take the issue of his 'human' rights to the United Nations where the black African states would back him up.

Even during the interviews Malcolm X was constantly looking behind his back and this was to be his way of life for the remaining period of his existence. He seemed to believe that it was but a matter of time before the Black Muslim brotherhood got him. He felt well and truly trapped for, while 'the so-called moderate' civil-rights organisations avoided him as 'too militant', the 'so-called militants' avoided him as 'too moderate', while the press found it hard to accept anything except, in his own words, "my old 'hate' and 'violence' image". He even asked for state protection during this period and it was also now that he dictated, in nervous and suspicious fits and starts, the events of his extraordinary life to Alex Haley.

This was also the time when he began to plan for the first time for the future of his wife and his children, knowing that he had nothing to leave them except perhaps the royalties from this book for which he had already taken an advance.

Malcolm's travels ended where they had begun, in prison. Except that the one he was in now had no visible bars. Alex Haley who was one of the few to speak to him and meet him during this terse waiting period states that his statements were often vague and contradictory and his behaviour bordered close on paranoia. The fusillade of shots that killed him were perhaps the ones that set him free.

Exploring School-Community Linkages

Edward A Rodrigues

Tribal Education for Community Development by Rudolf C Heredia; Concept Publishing Company, Bombay, 1992; pp 247, Rs 300.

FORMAL education has always been perceived to have a crucial impact on the development of tribal communities in India. Much evaluation of this effort, however, has restricted itself to the quantitative spread of education in tribal areas. Various agencies involved in this effort seem to operate on a tacit assumption, that formal education is beneficial for the tribal community. The author of this study, however, critiques such an assumption emphasising rather, that the formal school certainly needs a greater degree of sensitivity towards the tribal community if it must prove to be truly beneficial to them.

The study is based on a survey of educational development in Talasari taluka of Maharashtra. This is a predominantly tribal region inhabited by the Warli community. The Jesuit missionaries have been working in this region for over four decades. They have a network of several schools in this region catering to the educational needs of the tribals. It is at their behest that this study was done with an aim of providing them a review of educational development in this region. Schools run by the missionaries, the government and the voluntary agencies are taken up for investigation.

Patterned very much on the survey method in social science research the initial chapters deal with theory and background issues, a chapter on data analysis and finally a concluding chapter dealing with issues that arise from the study. Data for the study was obtained from sample groups consisting of students, their parents and the school teachers. As is normally the case with the survey method, a vast amount of information was obtained covering personal background, present status, perceptions of themselves and others, group orientations, aspirations, etc.

The study offers a very complete and systematic presentation-cum-analysis of the data. From the analysis of the various relationships presented, it would appear that even in tribal communities, the socio-economic conditions continue to influence the relationships between school and community. The performance of the students, the support of their parents, the ability to take advantage of educational opportunities, the students' aspirations, etc, were all directly related to their socio-economic conditions. In the case of the

teachers, their enthusiasm and commitment for their job was directly related to the type of schools and the sort of inputs offered by the school administration. On both these counts the teachers in mission schools performed much better than their counterparts in the other schools.

As the author himself has pointed out, the data reaffirms theoretical positions concerning the influence that the larger society has on its school system. In this sense the tribal community is no different from other social groups. Overall the review of the mission schools does bring them out in a positive light. Despite certain shortcomings, the students, their parents and the school teachers displayed a high degree of awareness and enthusiasm for school education.

The conclusions from this study are both interesting and provocative. Despite the difficulty in establishing their relationship with the rest of the study, they nonetheless stimulate discussion on the relationship of school and community not only in the case of the Talasari tribals, but for tribal communities throughout the country. How do tribals perceive the school in their community? Why are Indian tribals in general not taking advantage of the educational opportunities offered to them? What should be the relationship between the school and the community?

Placed against a background of a political, economic and cultural awakening of tribal communities in India today, Heredia focuses on a micro-level change that the school can initiate in tribal communities. He argues that school can play a more active role in the process of social change taking place in tribal communities. While macro structures might be rigid monolithic and at times even oppressive, much can be done at the micro level to induce change. For the author the school must not only be a school but also a community centre. He suggests various types of activities to bring about this greater integration between community and the school, such as adult literacy, social welfare, parents-teachers associations, relevant syllabus, instruction in mother tongue, etc. The author himself admits that such a change would be met with great resistance. He sees the answer in a people's movement for educational change, but no effort is made in the book

to explain how such a movement can be brought about.

Perhaps there is need to rethink both 'school' and 'community' in terms of their ground realities. Are tribal communities necessarily homogeneous? Even in the Talasari setting fragmentation has already occurred giving rise to various social groups. Students from all these groups are in the class room. How should relevant education be defined in such a setting? Tribal communities are as such not exempt from the forces of change that have already taken place in the rest of the country.

The crux of the matter then is that 'school' whether of the formal or the non-formal type is a learning activity, that is firmly embedded in an ideology that reflects the dominant structures within a social setting. The mission school is as much an ideological activity, as are the schools run by the government. So what then is the mission's ideology in the class room? At no point is this issue discussed.

The model of the 'community school' is certainly a very creative and constructive concept. Yet, its success on the ground has rarely been witnessed in societies whose social structures are marked by economic and cultural inequalities. In such societies, the model often only has a populist value, it is used to disguise the contradictions and the inabilities of the system to provide effective and efficient education for its school-going population. From an anthropological point of view, it may well be said that Indian adivasis had for centuries their own non-formal form of community school. Why that form of learning had to be done away with and why an alien model introduced in their midst is exactly the problematic ground, from which any enquiry into educational development for tribal people must begin. That would bring to light the fact that even for the missionaries, the 'school' is part of the top-down model of development.

For those involved in either the research or planning of education in tribal communities, this book makes an interesting contribution. The data in this study could provide a good basis for comparison of educational development in other tribal regions of the country. At yet another level, the work can stimulate discussion on several issues concerning the 'school-community' relationship as it presents itself in tribal societies. Social activists working in this field must certainly take note of the work to evolve a more sensitive approach to the school in tribal communities.

Cultural Communication in Literacy Campaigns

Social Relational Contexts, Processes and Hegemonic Organisation

Denzil Saldanha

Communication processes in literacy campaigns have important implications for the movement of vast sections of people from a culture of orality to one of literacy. The teaching-learning process provides access to the symbolic systems of the literate universe. Several cultural groups and literacy activists are thrown up by the process of cultural mobilisation that takes place on a relatively extensive scale during the district campaign. What are the larger organisational implications in terms of creating an alternate cultural hegemony for economic entitlements, especially during the post-literacy period and beyond?

I Introduction

THIS article focuses on the environment building aspects of literacy campaigns.¹ Various communication media have been utilised in the literacy campaign districts in order to stimulate motivation, generate mass participation and to create a cultural climate that is congenial to literacy. Popular cultural forms have occupied a central place within the mobilisation process of environment building. The article begins with an identification of the messages and some of the folk media that have been utilised in literacy campaigns in Maharashtra. It continues with an analysis of the communication processes in the field on the basis of one's observations, interviews and group discussions.² These micro-level systems of communication have been discussed with reference to the folk media that have been utilised, the contexts and processes of communication, and the impact that they have had. The impact is seen both in terms of immediate motivation and mobilisation as well as the possibility of its transfer to sustained teaching-learning. What follows is a recapitulation of some general conclusions relating to popular communication during environment building in literacy campaigns.

Communication processes in literacy campaigns have important implications for the movement of vast sections of people from a culture of orality to one of literacy.³ The use of folk forms in environment building, in fact draws on the oral culture of the people in order to facilitate and motivate their transition to literacy. The teaching-learning process provides access to the symbolic systems of the literate universe. Several cultural groups and literacy activists are thrown up by the process of cultural mobilisation that takes place on a relatively extensive scale during the defined spatial and temporal frames of the district campaign.

What are the larger organisational implications in terms of creating an alternate cultural hegemony⁴ for economic entitlements, especially during the post-literacy period and beyond? The article attempts to address itself to this issue in conclusion.

While discussing the collapse of old paradigms and methodologies for communication studies, P Mohan underlines the need for a new approach that is contextually situated, descriptive in character, and that works upwards towards a theory of communication. "The new paradigm would have to seek paths of change only as ordinary people need and want them, and always in harmony with their environment and history. The new paradigm must not set its own course, but discover it. . . . Communication Theory must return first to the villages, the workshops, the marketplace, and even to the places of worship—but this time only to observe, describe, and to try to understand [Mohan 1992: 775]. The approach in this paper is broadly in accordance with the one that has been suggested.

A brief explanation of the emerging conceptual framework might be useful at the outset. One views the teaching-learning process of transition from orality to literacy as central to the literacy campaign. The literacy campaign is introduced into the relatively structured and given socio-economic context of the district. It attempts to create a cultural climate for literacy through the use of folk media drawn from the culture of orality of the people. This process sets in motion the macro-level dynamics of social mobilisation right up to and during the micro-level phenomena of teaching-learning in scattered villages and in discrete groups. One has attempted to describe the contexts, processes and forms used while communicating in village situations and their impact on motivation for sustained learning. These systems of communication, as part of a larger cultural mobilisation, have im-

portant implications for the possibilities of creation of an alternate cultural hegemony during post-literacy by utilising the potential of the 'organic' intellectuals that might have emerged from the campaign.

II Messages through Folk Media

Several folk forms have been fruitfully utilised in the literacy campaigns in Maharashtra. During the environment building programmes in Ratnagiri district, for example, the kalajathas drew from musical forms such as lavani, powada, gondhal, jagar, etc. Environment building gave expression to songs from tribal traditions such as the Dhangari Lok Geet and from religious sects like the Varkaries, followers of Vithoba of Pandharpur. During the environment building phase which was held in an intensive manner from February 27 to March 8, 1992, 67 cultural teams went out to the different villages on kalajathas. The main thrust of the messages conveyed through song, dance and discussions was literacy. However, it was reported that other issues such as mother and child care, family planning, watershed management, the problem of alcoholism and dowry, small savings and agricultural development were also conveyed.

In this district, the participants in the kalapathaks were drawn primarily from the middle classes and in particular from the school teachers. However, in the TLC districts from the Marathwada region, like Latur and Nanded where the Bharat Gyan Vigyan Samiti (BGVS) has been active, one has observed a greater participation of the traditional practitioners of the folk media. The kalajathas organised by the BGVS from October 22 to 30, 1990, during the Wardha campaign were held in five central villages in each of the eight talukas of the district. These jathas were also reported to have involved several local traditional artists.

The District Literacy Campaign Committee of Latur, with the participation of the BGVS, has brought out a recorded cassette—Saksharta Geet Mala—of songs that draws on various folk forms: geet, bharud, bhajan, abhang, gondhal, lavani and powada. A content analysis of the central themes in these songs suggests that the following areas are covered: literacy for a happy family life and as a key to knowledge; literacy for women's emancipation; the problems of alcoholism, dowry and superstition; poverty and oppressive work conditions of labourers and literacy as a tool for emancipation; caste discriminations; inspiration to keep pace with a changing scientific world; literacy as prayer and devotion to god and the spirit of nationalism.

One has come across several innovative forms being used during the environment building campaign. Some of these spread the message of literacy by relating the forms to local festivals: akshar kandils and akshar rangoli at the time of Diwali and Akshar Ganapati at the time of the popular festival in Maharashtra. These were extensively used in Ausa taluka in Latur district. In the Sindhudurg campaign, haldi-kumkum celebrations were widely used to mobilise the women and bring them together to discuss issues related to their everyday life. In the slum pockets of Bombay, a voluntary organisation Committee of Resource Organisations (CORO) has attempted to relate literacy to major social reformers who have been close to the dalit community by celebrating the anniversaries of Jotiba and Savitribai Phule and Ambedkar. The environment building phase of literacy campaigns has contributed not only to the motivation for literacy but also to the education of the literate middle classes by releasing the latent creativity of a large number of individuals. Teachers, low level government officials and unemployed youth from sections that might be considered as "traditional" intellectuals have been drawn to the cause of literacy for the disadvantaged. There is a need for an organisational form that would take forward the potential of these individuals in a sustained manner during and after the post-literacy phase of the campaign.

The District Literacy Campaign Committee of Nanded has published a collection of folk musical forms that were to be used in environmental building. The publication is entitled Sakshar Sarita (refer to the appendix for a brief description of some of these forms). The compositions were selected in a participatory manner. Language and music experts were also consulted. During our field visits we found that local artists and instructors were making use of the publication.

The following table presents a cross tabulation of the different folk media according to their thematic messages. One finds that geet, a popular form that is

generally used in diverse occasions, is most represented in the publication. Devotional forms such as abhang, bhajan and bharud are the next in importance. The musical form of lavani that has found expression in the popular theatre of tamasha, has also received adequate representation in the text.

One has attempted to identify the central thematic focus of the messages communicated through the various folk media. The content of an invitation to the ignorant (adani) to move out of the darkness (andhar) of illiteracy towards literacy is the one that is most often repeated. This theme is to be predominantly found in the forms of geet, abhang and bhajan. Communication processes and forms provide some indication about the subject who is communicating, i.e., the composers and the performers. In the case of the foregoing theme, it appears that a middle class condescension towards the illiterate has gained some degree of predominance in the compositions. Most of the thematic messages provide a rationale for achieving literacy. However, some of them focus on a direct inspiration for literacy through the use of emotional appeal, metaphors and colourful language. These songs are, as it were, a glorification of the letter (akshar) and an invitation to literacy. The call to women to view literacy as a means to their emancipation is a theme that has a high degree of predominance throughout a number of the forms, in particular, bharud, gondhal and geet. This is relevant in a situation where the vast majority of the learners are women. The spirit of nationalism as an inspiration to literacy resounds in some of the forms; as well as the call to widen one's horizons and gain knowledge (vidya, dnyan). It appears that some of the messages that might have a greater contextual appeal to the lives of the learners and instructors—the conditions of oppression and the rights of labourers; overcoming cheating and usury, inspiration to voluntary instructors; inspiration from social reformers for learning and the appeal to enrol in schools—have not been adequately represented. The powada which has been used in the past to inspire social awareness during movements, covers some of the messages; as well as the more secular forms of lavani, ovi and street play. Do some of the forms lend themselves by their very aesthetic qualities to the propagation of particular messages, is a question worth researching.

III

Local Contexts and Processes of Communication

This section adopts an inductive approach to micro contexts of communication. It describes the contexts and processes of the use of folk media in varied

field situations and at different points of literacy campaigns. One attempts to narrate one's learning experience in response to these situations.

We visited Budhada village in Ausa taluka of Latur district on November 6, 1992. Budhada has a population of 2,324 persons. 110 illiterates in the age group of 15-35 had been identified in the survey. The teaching-learning process in this taluka and village had begun in May 1992. The initial 22 classes had now been reduced to 16 as a result of drop-outs from among the instructors and the impact of drought, the onset of the monsoons and the agricultural season. However, an attempt was made to integrate some of the left out learners into the running classes. The village had an upper-primary school with eight teachers. Unlike the situation with most primary schools, the teachers resided in the village. They could thus more closely identify themselves with the motivation and conduct of the campaign at the village level.

We moved around the village, tracking down the dynamics of the campaign from instructors to the learners, to the teachers who trained and monitored the campaign, to what was generally perceived to be the initial motivating fulcrum of the campaign—a cultural group called the Panchasheel Gayan Mandali, which had played a major role in the environment building process in this and the surrounding villages. The earlier Adult Education Programme was running for the past one and a half years prior to the campaign. According to the prerak of the Jan Shikshan Nilayam (the literacy activist who conducts the post-literacy centre), the major difference from the past was that a programme with paid instructors and preraks who were doing a job was converted into a social movement. Teachers, students, the educated unemployed youth, the prerak (himself) and the instructors were organised towards voluntary participation in a cause. The cultural group through its rousing songs and their emotive appeal was seen to have lit the first spark of enthusiasm for the campaign.

The group is equipped with dholak, a harmonium, and jhanja. Seven members of a dalit family constitute the group. The lead singer is a girl in her late teens, a seventh standard drop-out from school. The other members consist of her father, mother, uncle and two brothers. The family had been performing in the surrounding villages singing the literacy songs prepared by the campaign organisers, the Bharat Gyan Vigyan Samiti (BGVS) in particular, and the ones they themselves had devised. During this period they managed to survive on the hospitality and gifts provided by their rural audiences and the honorarium. Travel to several villages often meant forgoing agricultural wages which was seen to be worthwhile when one had the satisfaction of getting involved in a

national programme. Their spontaneous performance outside their hut on the outskirts of the village attracted a number of village women. The male folk were out for agricultural work. The performers considered their songs as entertainment with a message. They generally explained the thematic content of the song to their audience. The music helped to draw an audience and to hold their attention, while knowledge was imparted through explanations and discussions.

The motivational impact of the cultural group had spread to a nearby school for the technical training of the blind. The visually handicapped youth in this institution were being trained for weaving and other handicrafts and had begun to learn braille under the guidance of a blind instructor. They had learnt reading and some amount of numeracy with an enthusiasm that outshone that of the sighted illiterate in the village. Their writing abilities were hindered for lack of adequate material. They attributed their interest in literacy to the songs of the local cultural group.

The Panchasheel Gayan Mandali represents the mobilisation of a local, traditional cultural resource—an entire dalit family of singers and performers—to meet the regional needs of the environment building phase of the campaign. Thanks to the literacy campaign a fragile cultural resource based on folk media is provided a direction and a wider legitimacy in its processes of communication. Cultural groups and their involvement in the environment building dimension of the macro campaign process are found to make a major contribution towards the initial motivation of learners and instructors and the consolidation of various social forces—government departments, educational institutions, voluntary organisations and the unorganised interested community in the “social movement” that is the literacy campaign. The use of folk media drawn from local traditions and the direct informal communication processes within small gatherings, facilitate the motivational impact.

SUSTAINING MOTIVATION FOR LITERACY

Can this impact be sustained over the micro-level teaching-learning process which calls for a comparatively greater amount of discipline, regularity and investment of energy as compared to the flexible and spontaneous dynamics of the environment building phase of the campaign? One has observed that learners and instructors approach the teaching-learning process with a framework of priorities whose configuration is derived from their experience of the struggle for survival in everyday life. High points in the rainfed agricultural season like sowing and harvesting operations, drought, elections, school examinations and vacations, festi-

vals and communal riots result in major breaks in the rhythm of literacy campaigns and, in particular, the teaching-learning process. This provides some indication of the “rational”, sustenance-based ordering of priorities. Attempts have been made to create smaller bursts of cultural mobilisation at different phases of the teaching-learning process, especially during low points and periods of stagnation. All opportunities for direct personal contact during the preparatory phase of the campaign have sometimes been utilised to sustain motivation, i.e., the survey, training, distribution of material and monitoring. Motivation for literacy, especially when it does not result in immediate economic gain, needs to be seen in this context of grounded priorities. Literacy within the campaign approach calls for a reordering of and a direction to existing priorities of everyday life. Perhaps more than and accompanying cultural events as part of a cultural movement, a functional orientation to literacy instruction could provide the capacity to sustain literacy learning under trying circumstances.

We encountered another cultural group in Valsangi village of Ahmedpur taluka, Latur district on November 7, 1992. Valsangi has a population of 2,223 with 271 learners in the 15-35 age group. 26 classes run by instructors, of whom 17 are school students, cater to the needs of the learners. The classes were struggling ahead despite the claims of the harvesting season on the time of the learners. This cultural group consisted of three generations of a dalit family whose members contributed in different ways to different aspects of the campaign. The father was a primary school teacher by profession and also served as a master trainer. He himself, his wife, son, two daughters and daughter-in-law served as volunteer instructors. His mother had become literate during the course of this campaign. Two school-going grandchildren together with the rest of the family and the members of a local Mahila Mandal had formed a kalapathak, and had toured 10 villages during the environment building phase. The son acted as a pre-rik of the local JSN. Eighteen neo-literates had passed the fourth standard examination under his guidance. Themes related to social awareness were interspersed in between the songs calling on adult learners to join the classes and the young drop-outs to enrol in the schools.

A relevant question that arises is the nature of the organisational form that will consolidate and take forward the large number of cultural resources by way of individuals and groups that have been stimulated during the literacy campaign. Can the cultural process that borders on a movement be sustained in an organised manner after the campaign or will these resources relapse into so many disarticulated foci of cultural expression?

CONTEXTS THAT STRUCTURE PROCESSES

In Palshi village of Latur taluka in the same district, at night on November 5, 1992, one had an opportunity to observe the entire repertoire of a kalapathak. The programme had been organised in a village that was identified as ‘weak’ during the campaign and where the teaching-learning process had stagnated as a result of the agricultural season. The setting was the raised platform of the school building with the major part of the audience of about 300 persons sitting in the darkness on the village square across the road from the platform. Some space on the natural well-lit stage was reserved for the village influentials and the respected visitors who sat on mattresses and cushions. Behind these venerable persons sat some of the village women. The performers would emerge from a classroom by the side of the platform.

One goes into these details of the structured setting and social context of the cultural programme in order to make the point that a kalapathak generally enters a socio-economic context as a given situation. The structured allocation of space during the performance flows from the context and sometimes intervenes in the communication process. There was no dialogue with the audience on this particular night. However, the villagers, especially those from the poor classes, sat with rapt attention from 9.00 p.m. till 1.00 a.m. Attempts have been made on other occasions to breakthrough this imposed structure on communication by having a more open setting, by the performers moving among the audience and engaging in informal dialogue and by doing away with the rituals of speeches, votes of thanks and garlandings.

The entire performance bore the character of several scripts within an extended script, constructed into a meaningful whole. It was comprised of kirtans and bhajans sung by a traditional kirtankar with much humour and compelling emotion while conveying the message of learning and literacy; a street play depicting the problems encountered by illiterates, the reasons for the neglect of schooling during the school-going age and the functional aspects of literacy; songs conveying the need for literacy and self advancement; a mono act which narrated stories, anecdotes, and jokes while explaining the need for learning; a skit which drew from mythologies in order to underline the limitations of superstition. The entire programme was interspersed with songs, poems and direct emotional appeals to the adult literate in the village to join the classes, be literate and widen their horizons. One did not have an opportunity to discuss with the assembled villagers given that the programme had extended late into the night and the audience dispersed immediately after. However,

going by the rapt attention and their reactions especially to the humorous and emotional situations, one got the impression that the kalapathak is a powerful instrument for communicating a message to the rural audience and for generating initial motivation. It becomes necessary to have a relatively discontinuous follow-up to these programmes in terms of the next stage in action, lest the cultural programme remains as only a vivid event in memory—an entertaining break from the drudgery of everyday life.

That the reproduction of social structures in the setting of a cultural performance results in inhibition of communication processes, may also be seen in the example of the single-actress play *Vhay Mi Savitri Bai* performed by S Deshpande. We observed its performance on March 4, 1992, in Ratnagiri district. The play depicts the life story of Savitribai Phule as narrated and enacted by her. This powerful medium had been fruitfully utilised in several villages of Ratnagiri district to motivate the women to literacy. The play was able to hold the audience to spell-bound attention with the skilful enactment of an emotive theme that is close to the lives of the women in the district. On this occasion, however, one found that attempts on the part of the performer to stimulate dialogue with the audience met with little success. The reason appeared to be partly due to the mixed audience of males and females which also included children. The women were inhibited to speak out in this context. The other factor was the socio-economic spatial context. Persons from the dalit community who formed the agricultural labourers and poor peasants in the particular village community sat on the ground before the stage. Their employers, the well-to-do farmers and horticulturists from the region, sat on chairs behind them. The location of the play itself was the large courtyard of a major landholder, a political figure in the village who traded in horticultural produce. All these were contextual factors that dampened the possibilities of any horizontal communication. However, one could observe that the audience though silent, left with much food for thought.

The BGVS has played a major role in the environment-building phase of the campaign in Latur district and in the Marthwada region in general. A single kalajatha covered about 10 villages in the vicinity of a central primary school. A halt and stay in a village was followed by prabhat pheris in the morning, discussions with the learners, potential instructors and members of the village education committee during the day and cultural programmes in the evenings. The kalajathas of the BGVS were held during August 15-30, 1992 and covered two talukas of Latur district. Antar Bharati, a voluntary

organisation in the region, covered two other talukas while the fifth taluka was allotted to a high school.

POTENTIAL AND LIMITS OF CULTURAL MOBILISATION

Shirur Dhabade village in Mukhed taluka, Nanded district, is an illustration of the phenomenon that environment-building activities, even with the incorporation of media drawn from the oral traditions of the people as inspiring persons to move from orality to literacy, do not necessarily get translated into motivation for sustained teaching-learning. This was considered to be one of the 'stronger' villages in the literacy campaign and in one of the better performing talukas. Hence its importance. We visited this village on November 11, 1992, after the cultural mobilisation of learners, instructors and village level campaign organisers had been held. The initial motivation of 789 learners identified in the village had been consolidated into 74 classes conducted by trained instructors. The instruction had begun on August 15 and the learners were expected to have neared the completion of the first part of the kit. Despite the enthusiasm of the beat-level full time workers in the campaign, of the teachers from the local primary school and the volunteer organisers of the local campaign, one found that the combination of vacations for the teachers and students, and the harvesting phase of the agricultural season had taken its toll on the consistency of the teaching-learning process. Only 28 out of the 74 classes were running during the period of our visit. The claims of survival in everyday-life had gained precedence over the demands on time for literacy instruction. Learners, most of whom were poor peasants and agricultural labourers, had opted to invest their energies and time in maximising the gains from the limited agricultural season, especially in the context of the long months of drought that preceded it. We had reason to believe that they would get back to teaching-learning after the season, perhaps after suffering a relapse from the low levels of literacy that they had attained.

During our round of the village after 9 p m, the time of the classes, we met an elderly primary teacher resident of the village but who taught at a neighbouring one. His son and daughter were engaged in adult instruction while he assisted them through guidance and inspiring songs. He was involved in the local cultural group which had covered this and the surrounding villages. The folk songs that he sung together with the adult learners attempted to motivate learning. The songs drew inspiration from patriotism as citizens of the state of Maharashtra and devotion to Goddess Saraswati on the one hand, and the everyday-life example of persons in

similar economic situations on the other. The latter song narrated the story of a daughter-in-law who overcomes the opposition of her father-in-law while persisting with the instruction of her mother-in-law. The male head of the household appreciates the value of literacy and the desire of the women for learning, only when he himself is cheated.

Later that night a cultural programme related to literacy was spontaneously organised. There is a tendency for village-level organisers to hold a cultural performance for the benefit of visiting outsiders. This appears to serve the purpose of seeking legitimacy and appreciation from the wider universe beyond the village and sometimes to cover up the relative failures of the arduous teaching-learning process with the spontaneity of song and dance. The music attracted a large gathering even though it was past midnight. After the initial programmes, we converted the function into a forum for discussion on the problems that the villagers presently faced as regards instruction and the contrast between the enthusiastic response to the cultural event and the poor attendance at the daily literacy classes. Discussions with the members of the cultural group, the local organisation and the assembled villagers led to the following conclusions.

Kalajathas and cultural performances are high points in the life of villagers. They help to create a generalised consensus on the need for literacy, to organise interested persons at the village level, to inspire adults to learning and to convey messages relevant to social development. They attract an audience and convey messages in an aesthetically pleasing and emotionally inspiring manner which otherwise would not hold attention. Importantly, cultural events create a forum for meeting, discussion and planning. However, the drudgery of everyday-life and the demands of the agricultural cycle tell on the regularity of the literacy classes. Organisational factors, such as teachers away on vacations and the leadership involved in the elections, also intervene. The meeting dissolved, not before it was recognised that the campaign was primarily that of and for the village and its learners (not that of the collector, the visitors, the taluka and district-level organisers) and after the garlanding of the learners who had persisted despite great odds and the announcement of a meeting the following day to plan for the revitalisation of the literacy campaign.

CULTURAL HETEROGENEITY IN CONTEXTS OF URBANISATION

A meeting with the organisers, instructors and learners at the Urdu High School which looks after the campaign at the predominantly Urdu speaking Ward No 22 of Nanded town and at the Municipal Marathi High School that co-ordinates activities in the neighbouring Ward Nos 20

and 21 was held on November 9, 1992, during the day. The schools work in close co-ordination. A joint cultural function held on the occasion at the Samaj Mandir suggested how a cultural event could provide a forum for inter-communal communication at the level of orality and folk culture. Religious and linguistic identity was maintained in the instructional process, with Muslim learners being taught through the Urdu medium, their language in the domestic sphere, while Hindus and dalits learnt in Marathi, their mother tongue and the language of public 'functional' communication in the district. The cultural programme however was conducted by a group of musicians drawn from both communities. The music was inspired by the kawali, gondhal and jogwa forms (the last, a folk form that is traditionally sung by mendicants in honour of the deity, Khandoba). The entire audience understood and related to the variety of popular forms in the two languages which were drawn from diverse religious and oral traditions.

While cultural heterogeneity might make for an organic development of inter-communal communication at the level of oral tradition, it does not necessarily lend itself to the efficient conduct of the teaching-learning process and the transition to adult literacy. We were given to understand that the programme in Nanded city itself was faltering. The problem arises with respect to organising and monitoring the day-to-day teaching-learning process where instruction is conducted through diverse linguistic media and, in addition, is confronted with other problems of urbanisation. Whereas in Nanded district the instruction was through Marathi, Hindi, Urdu and Telugu, the neighbouring Latur district had pragmatically opted, through a process of seeking consensus, for one language—Marathi. It was agreed that Marathi in effect was and would be the language through which the adult literate express themselves in public, functional discourse.

Rural-urban differences have important implications for the conduct of the macro-level campaign mobilisation through communication media and for the micro-processes of instructional communication within distinct literacy classes. Literacy campaigns have generally faced far greater problems in urban areas than in the villages. While well endowed with institutional and human resources, urbanised centres—whether large villages located along highways, towns or cities—have generally faced more problems than smaller villages and relatively homogeneous ones. Apart from their ethnic heterogeneity, urban conglomerations have discrete and functionally institutionalised resources that do not lend themselves to co-ordinated deployment in the cause of literacy. Environment-building measures are confronted with conflicting stimuli—television, cable TV, films—and the dilution and the dissipation of literacy messages. There are conflicting claims on the time for literacy within a context of relatively greater opportunities for self-employment and employment in the informal sector. Apart from psychological and functional reasons that are stated by adult learners as motivating them to literacy—removal of the stigma of illiteracy, a feeling of self-worth and greater independence in inter-personal relations, the ability to communicate through letters and by reading newspapers, greater facility in spatial mobility and functional relations with offices and shops and the capacity to take interest in the education of one's children—an implicit motivating factor for regular attendance at the classes has been the social space that they provide for 'leisure'. Leisure, in the context of literacy learning and especially in a context where no immediate economic gains are visualised, is understood as space and time for oneself and for self-development in joyful interaction with others. The cultural and developmental messages of environment creation get dispersed in their effects and

the social space for 'leisure' gets crowded out by the conflicting claims in urban settings.

One has observed these problems not only in Bombay city where a voluntary organisation, Committee for Resource Organisations (CRO) is engaged in a literacy drive in M Ward among the dalit bustis, but also in Nanded city as discussed above, in Latur city, in Loha town of Kandhar taluka, Nanded district, and even in urbanised villages like Ambulga with a population of around 7,000 in Nilanga taluka of Latur district.

We visited Loha town earlier in April 1992 when a major public meeting was held during the environment-building phase of the campaign and again on November 8, 1992. Loha with a population of 15,065 is situated on the state highway. It is well endowed with educational institutions: seven primary or upper-primary schools, three high schools and two colleges. Several training programmes for the regional resource persons and master trainers had been held here. It was visualised that this trading town, market place and communication centre would serve as the focal point for the diffusion of literacy messages and a model of literacy practice for the surrounding villages. The teaching-learning began on May 1, 1992 with 319 classes. However, at the time of our visit on November 8, 1992 only a few classes could be got going for our observations and a majority of the classes had discontinued during the agricultural season and the vacation period. It was film time on the television and market day on the streets. This scenario does not accurately represent the then status of literacy instruction nor the potential of Loha to recover as a result of the efforts of its enthusiastic and committed organisers. What was clear was that while the rural areas around Loha had gained, the campaign in Loha had stagnated, ironically because of the very factors that contributed to its being a major

TABLE: FOLK CULTURAL FORMS

catalyst and focal point for literacy resource persons and educational institutions. A talking point of this literacy campaign, as was pointed out by the local organisers, was the regularity in a class conducted for the prostitutes of the town. Escaping the perceived double stigma of illiteracy and the profession with the possibility of training for self-employment during the post-literacy phase, provided the motivation to these learners.

PERSONALISED COMMUNICATION THROUGH MONITORING

It appears that a disciplined, organised monitoring of a functionalised teaching-learning can contribute more to regular learning, especially in urban areas, than the spontaneity of cultural mobilisation which creates a consensus on literacy, a consolidation of social resources for organising the campaign and an initial motivation for literacy learning. Systematic monitoring and visits to literacy classes by officials and non-officials provide an element of personalised contact. There can be no substitute for personal contact in its capacity to sustain teaching-learning with adequate literacy outcomes. While functionality in terms of skills and organisation for employment generation provide a contextual meaning and direction to literacy, personal contact provides a human dimension.

The literacy campaign in the HUDCO community on the outskirts of Nanded city provides a good illustration of the effectiveness of systematic organisation and monitoring of a functionalised literacy programme, with regular personal contact, in a relatively homogeneous industrial working class community. Household members of most of the 903 learners, about 95 per cent of whom are women, are employed in the nearby CIDCO industrial estate. Several environment-building activities, like the initial kalajatha, haldi-kumkum celebrations, rangoli competitions and Akshar Ganapathi were held from May 1, 1992. But when the 84 classes were initiated from August 15, 1992 till the time of our visit on November 8, 1992, what has sustained relatively uninterrupted learning has been the efficient monitoring of classes by the school teachers from the five primary schools and the one high school and by resource persons, master trainers and full time volunteers. This has been reinforced by the reported high motivation of women learners who view literacy as an improvement in status, bringing them on par with their literate counterparts in the community. A self-employment programme among the women has also been initiated.

Shemboli village in Bhokar taluka of Nanded district, visited by us with the collector on November 9, 1992, is an illustration of how direct contact with a higher government official can sometimes spark

off the literacy campaign. The 650 illiterates in this village headed by their sarpanch had been consistently resisting the campaign on the questionable ground that the primary school should be given prior attention and the collector should himself visit the village to hear its problems. On the day of our visit a rousing discussion between the collector and the villagers helped to convince the latter of the importance of literacy. A decision was collectively taken to start the programme the following day. All necessary arrangements in terms of material and training had already been made. The villagers were apparently only waiting for a sign of direct concern from the administrative authorities.

CULTURAL HOMOGENEITY AND ETHNIC/CLASS IDENTITY

One has come across several instances where cultural homogeneity, especially among the oppressed, results in an efficiently conducted teaching-learning process. This has been seen in the dalit hamlets of villages in Sindhudurg and Ratnagiri districts during their campaigns. Inspired by the educational processes set in motion by Phule and Ambedkar, the dalits in these padas have utilised their local cultural resources for environment-building and have harnessed the available educational resources for training and instruction. The literacy achievements of these learners have generally been high.

Kuntur Tanda of Biloli taluka in Nanded district provides another example of the mobilisation of local cultural resources by a cultural group in the banjara (lamani) community. On the day of our visit on November 10, 1992, there was a power failure in the village. The break in the electricity supply resulted in the disruption of the nine classes for the 88 learners in the village. It did not dampen the enthusiasm of the cultural group. A spontaneous programme was held for the assembled villagers in the moonlight. Several songs were sung with traditional musical instruments in the Lamani dialect and utilising the tribal folk media. Linguistic and ethnic identity was thus maintained through folk cultural expressions, while integration into the surrounding Marathi environment was found through the medium of literacy instruction. The kalapathak from this village had travelled far and wide spreading the message of literacy among the Banjara community in their language. The classes in this village were reported to be regular, despite the agricultural season. Literacy and education were seen by the Banjara community as providing one of the few avenues for socio-economic mobility. The community has already achieved a limited degree of political representation in Maharashtra politics. The late night programme was brought to an end with a community folk song sung by some

of the assembled women. The expansion of social space for women in the act of singing cannot be underestimated.

In contrast with the poverty yet cultural homogeneity of Kuntur Tanda is the case of the relatively prosperous Nagtirthwadi village in Udgir taluka of Latur district, inhabited exclusively by the Reddy Yellam caste of rich peasants. It was a period of gram panchayat elections when we visited the village on November 4, 1992. While the election fever in the surrounding villages affected the literacy campaign, in this village the sarpanch was to be elected unopposed. According to him, his leadership during the literacy campaign had brought about this unanimity. Instruction had started in July 1992. The 44 learners in this village of a population of about 5,000 had been organised into 5 effectively conducted classes under trained volunteer instructors. The learners had made appreciable progress in this village which had to its credit a total enrolment of children in the school-going age; an exception in the district.

IV

Some Conclusions on Local Communication Systems: Context-Process-Impact

Some tentative conclusions may be drawn from the foregoing descriptions of cultural communication in field situations. The kalajathas and their kalapathaks have clearly been the fulcrum of environment building activities. They have played a catalytic role in creating a climate for literacy within a larger mobilisation process. They have drawn on the traditionally existing folk culture and from diverse local contexts. These resources have been not only in terms of the media for communication, but also the human resources within the folk traditions of the people, i.e., kirtankars, shahirs, bhajan mandalis, tamasha mandalis, gondhalis, families from tribal and dalit communities, who were engaged in the performing arts. The literacy campaign, as a result of its people's movement approach, has enabled these persons and their folk media to acquire a wider regional legitimacy and has provided them a direction through messages of relevant developmental communication. Persons, processes and forms within traditional folk culture have received a fresh breath of life and have acquired relevance in changed contexts. In districts where a participatory approach to the formulation and selection of communication messages has been adopted to a greater extent, accompanied by the participation of voluntary organisations—i.e., Nanded district—there has been a veritable groundswell of the latent creativity among the people.

The visit of a kalapathak to a village is generally an entry into a structured

socio-economic context. The pre-visit planning and the entire day's programme—consisting of the prabhat pheri, meetings and discussions with local activists, learners and instructors prior to the evening's cultural programme—helps to create a consensus among the different classes, castes and political formations within the village on the need/demand for literacy. Individual motivation moves towards organisational consolidation and a collective movement for local campaign implementation. However, the socio-economic configurations remain otherwise relatively undisturbed. These hierarchies often get reproduced in the contextual setting and spatial allocation during the performance of the kalapathak. Informal two-way communication consequently gets structured and inhibited.

The programme is generally conceived as several items, woven into a coherent whole for effective impact—scripts within a total script. It attracts a large audience of a cross-section of villagers and is able to hold them in rapt attention. The informal style, the direct and emotional appeal, the mix of humour and serious messages and, most importantly, the use of folk media that draws on the familiar culture of orality among the people and urges them to make the transition to literacy through learning, help to create a significant immediate impact. Motivation for learning and instruction, a greater resolve among the literacy activists and their local organisation, flow from this generalised impact. The cultural performance provides a forum for inter-communal communication at the level of folk traditions. In addition, it provides one more occasion for dialogue and planning for the campaign.

As Wang and Dissanayake (1984:29) point out, an indigenous communication system is one sub-system contextualised within a larger cultural system. It is a living tradition that undergoes change while maintaining some degree of continuity. The use of folk media in literacy campaigns has provided them a new content and purpose within relatively traditional forms. The contexts of performance undergo some degree of transformation, i.e., devotional music is brought from the temple and the home to the streets and the class-rooms.

The social dynamics and communication processes of the literacy phase of the campaign might be conceptualised as taking place at two levels. The macro-level mobilisation of human, material and institutional resources consists of the different components of the campaign like planning meetings and conventions; the identification of individual's organisations and institutions; the environment building activities; the creation of organisational structures for implementation at various levels of the district; the survey; the preparation and acquisition of teaching

material and the training. The kalapathak as part of the process of environment building plays a central role within this larger framework of mobilisation. The relatively phased structure and flexible dynamics of the macro process of mobilisation needs to be distinguished from the comparatively continuous and disciplined micro-level process of teaching-learning that takes place in scattered classes or on a one-to-one basis, the monitoring of these micro phenomena and their evaluation. The immediate motivational impact of the use of folk media in environment building does not get mechanically transferred into sustained teaching-learning. In fact, even the social awareness messages communicated through the former need to be reinforced by the pedagogical process in the literacy classes so that they might have a more lasting effect on consciousness. The inspiration derived from the culture of orality needs to be elaborated through the appropriate use of the literacy texts in the classes.

Apart from the very fact of the above mentioned two-level communication processes that have relatively distinct rhythms of activity, there are other factors that intervene between cultural mobilisation and sustained motivation for literacy among the adults. Learners approach the instructional process with a configuration of grounded priorities that emerge from the annual cycle of everyday life. The decision to invest time and energy in literacy is met with the counter claims of high points of the agricultural cycle, the seasons of migration for employment, festivals, school examinations and vacations, elections and communal disturbances. Some of these objective factors might be beyond the capacity of campaign organisation to control. However, one finds that sustained teaching-learning and regular attendance depends to a large extent on subjective organisational factors such as systematic monitoring, personalised contact and functionalised instruction. These inputs into the pedagogical process can be reinforced by short bursts of cultural mobilisation during phases of stagnation.

Urban-rural contextual factors also result in a differential capacity for sustained learning. Urban centres while rich in human and institutional resources, ironically pose several problems to their co-ordinated mobilisation for literacy because of their very functional institutionalisation. Urbanisation results in conflicting communication messages that dilute the impact of attempts to create a climate for adult literacy. The claims on time and energy and the comparatively greater opportunities for employment in the urban informal sector conflict with the need for regular attendance in literacy classes. The social space for 'leisure', as defined earlier, is crowded out.

One has observed that cultural homogeneity with a given unit of mobilisa-

tion—i.e., tribal or dalit villages/hamlets, the social characteristics of Sindhudurg district—lends itself to the sustained impact of communication within the environment building and the pedagogical process. Context and messages blend together in relative harmony. In addition, there is greater facility in monitoring a campaign with an instructional process that is conducted in a single language.

Sustaining Learning through Hegemonic Organisation

What are the larger implications of the campaign style of cultural mobilisation for literacy in terms of its capacity to create a 'learning society' that would not only sustain and enhance literacy (access to symbolic systems) but also ensure more equitable economic entitlements? If literacy is not to remain merely symbolical, campaigns would have to confront this question. And since the campaign process gives rise to and is also part of the literacy product, the organisational aspect of campaign mobilisation should throw light on the above mentioned question. A comparison of the social dynamics set in motion by voluntary 'action groups' and by the literacy campaigns helps one to understand the potential and limitations of the latter.

There are major differences in the mobilisation processes and organisational forms that have been used by some social action groups—i.e., non-party political groups—and the literacy campaigns.¹ Both engage in cultural and symbolic communication towards social change but through contrasting approaches. The former directly addresses themselves to inequalitarian socio-economic structures, relatively close to the time of their entry in a given region. Organisational consolidation and the process of struggle for change are based on the cultural traditions of the concerned people. Education in its deeper meaning of learning to think critically and creatively is linked to the political act of social transformation for an alternate and more egalitarian development. The struggle for social transformation is itself seen as an informal process of education in widening circles of social awareness of one's interests, of the need for symbolic communication and of a felt-need for the letters. The recourse to literacy and to its symbolic systems is based on increasing felt-needs in the process of struggle. The social dynamics of this process may be seen in terms of expanding circles of symbolic communication based on experience, struggle and consciousness within everyday life: economic interests—organisation—a struggle that is contextualised in culture and growing consciousness—literacy. Symbolic communication thus becomes organic to and

contextualised within socio-economic

Literacy campaigns, in contrast, have generally a reverse dynamic. Social mobilisation makes its entry into a given regional unit—district, taluka or village—taking the socio-economic structures of those contexts as relatively given and, at least initially, leaving them undisturbed.⁶ While functionality, social awareness and organisation for change are part of the stated objectives, the consensus and action across classes/castes/political formations that emerges is directed at literacy. Literacy, at least on the surface, does lend itself to such a fragile consensus at the initial stage. Action for change is postponed and the organisational consolidation is for literacy.⁷ In a situation where both mass organisations for and social awareness of the need and possibilities of change are generally absent in rural areas, a 'breathing space' is thus created for the possibility of mass literacy. The recourse to folk culture in creating a climate for facilitating the transition from orality to literacy, thus becomes 'instrumental'. Symbolic communication at the levels of culture and literacy instruction in effect become instrumental to organised action for social change, if indeed the latter is the final objective. However, a significant difference from the earlier National-Adult-Education-Programme approach is the mass-level social mobilisation and the consolidation of various social resources—government departments, educational institutions, the organised/unorganised people—for literacy. Apart from the gains in terms of numbers of literate that are achieved through social mobilisation, the organisational structures that emerge at various levels serve to ground literacy in 'experience'. Literacy would otherwise have only a symbolic 'expressive' value, parallel to everyday life. A fertile climate is created for the possibilities of hegemonic organisation.

Another difference between the TLC organisational structures and those of the social action groups may be noted. The former consist of disparate individuals, motivated and mobilised as part of organised collectivities for literacy. The individuals are drawn from diverse class, caste and political formations and from distinct social resources, despite their, at times, real conflicting interests. This fragile organisation is feasible given that the central message of a cultural transformation for literacy is—at least initially and on the surface—non-threatening and non-polarising. The social formations of the action groups, in contrast, are comprised of organised individuals within a class/caste collectivity and as part of a programme of consciousness and action for exercising control over economic and ecological resources.

Field experiences suggest that literacy campaigns do have a major hegemonic potential. The mass approach and the

recourse to popular culture in mobilisation and organisation for literacy have resulted in several individuals growing closer to the needs of oppressed classes and castes. These have emerged from sections that one might consider in Gramscian terms as 'traditional intellectuals'—government officials, school teachers, the professional middle class and educated unemployed youth. Literate persons whose culture is organically steeped in that of the people have shouldered the task of cultural mobilisation—shahirs, kirtankars, bhajan mandalis and several others who were 'traditionally' engaged in popular performing arts. These individuals have a potential of serving as 'organic intellectuals' of the people, playing a role that 'mediates' between the cultures of orality and literacy and 'directs' the transition from access to communication symbols to struggle for economic entitlements. Some of these individuals have been incorporated as preraks of the post-literacy centres during the post-literacy phase. The relative success of the campaign approach has also given rise to a vast section of neo-literates in several districts.

There is a need for an organisational form that would sustain and consolidate these possibilities for an alternate hegemony during the post-literacy phase. Such organisations cannot emerge spontaneously. The movement from orality to literacy gains existential meaning only when the process is carried forward towards a sustainable learning society for social change.⁸ It appears clear that extensive literacy can be achieved by the relatively intrusive process of the literacy campaign, penetrating the everyday life of the disadvantaged from without, and attenuated by the utilisation of popular cultural forms for social mobilisation. But literacy itself can only be sustained and rendered meaningful by alternate hegemonic organisational forms that are close to and that advance everyday life through a change in the structures of oppression.

Appendix

A NOTE ON SOME OF THE FOLK CULTURAL FORMS

The descriptions are drawn from the text: *Sakshar Sarita*, District Literacy Campaign Committee, Nanded, 1992. Parmar (1975) and Ranade (1985) also describe some of these folk media. The compositions in *Sakshar Sarita* were selected out of the very large number that were received. The final selection was made by the Committee for Environment Building, Nanded, taking into consideration factors relating to tune, simplicity of language, effectiveness and popularity. Singers, musicians and language experts were consulted.

The Geet is a popular form generally used in rural gatherings. It has found a place in films and theatre. It is often used on festival occasions. Traditional as well as modern instruments could be utilised by a solo or group of singers.

Abhang is a devotional form used in praise of the deity. It is a form which is closely connected to the bhakti tradition in Maharashtra and has been used by the saint poets such as Dnyaneshwar, Tukaram, Namdev, Chokhamela, Janabai, Muktabai. The form appeals to a cross-section of persons from the illiterate to the highly educated. The instruments that are generally used to support the singing of the abhang are tal, tabla, harmonium and mridang.

The bharud and gondhal are also devotional forms that have deep roots in the culture of the people. They have been used by the saint poets who have drawn on the everyday lives of rural people. It has been traditionally used to generate social awareness. The gondhal is more particularly a form to express devotion to the clan deity. The bhajan mandalies use the bharud form to the accompaniment of tal, pakhavaz and veena.

The bhajan is a popular form used to express devotion to the deity. Its history can be traced to the 12th century. A number of villages in Maharashtra have their bhajan mandalies which are active during festival occasions. Bhajans have been utilised to inculcate moral values. The bhajan mandalies are generally comprised of 10 persons. The songs are accompanied by the mridang, tabla, tal, chiplya, veena, harmonium and khanjia.

The powada is a powerful form within folk culture and has been used to inspire courage and to sing the praises of the brave. Its origins can be traced to the 17th century. Shahirs, the creators of powada, have made major contributions to Marathi literature. The form arose during the Peshwa period. It has been utilised in mobilisation efforts to spread social movements; examples are the Goa Liberation Movement (1955) and the Samyukta Maharashtra Movement (1956-62). The harmonium, tuntune, tal, dholki, kadi are some of the instruments used during the singing of the powada.

The lavani is a popular form in rural Maharashtra conveying romantic sentiments. It has made inroads into films and theatres. Tamasha, the popular theatre in Maharashtra, is the major context for this musical expression.

Notes

[An earlier version of this article was presented at the Seminar on 'The Use of Folk Media Forms in Total Literacy Campaigns', organised by the National Institute of Adult Educa-

tion and the Nehru Memorial Museum and Library, New Delhi, January 28-29, 1993. I am grateful to R P Mammen, P Nanal and V Kulkarni for assistance in the field and to the latter two for their comments on the folk forms.]

- 1 The National Literacy Mission (NLM) was launched on May 5, 1988 in response to the massive problem of illiteracy in the country. By December 1992, it was reported that 178 literacy campaigns had been sanctioned in parts of or in entire districts within the country. Projects in 33 districts had been approved for post-literacy and continuing education. It was estimated that the literacy campaigns had covered 60 million adult learners with about 6 million voluntary instructors involved in these campaigns. It is proposed to bring 350 districts under literacy campaigns by the end of the Eighth Plan (Literacy Mission, December 1992). The campaign approach might be briefly described as a concerted attempt involving various social resources with a high degree of voluntary commitment for the eradication of 'illiteracy in a defined region and a limited period of time.
- 2 One has been involved with the evaluation of some of the literacy campaigns in Maharashtra. Field visits have been made to Sindhudurg and Wardha districts during the last phase of these literacy campaigns, during the months of June-September 1991 and December 1991-March 1992, respectively. One has also had the opportunity to visit the Ratnagiri campaign for brief spells during the period March-May 1992 and again in February 1993. More recently, during the month of November 1992 one made an extended field trip to Latur and Nanded districts during their mobilisation and teaching-learning phases, followed by a visit in March 1993. The paper draws primarily on observations and discussions during the last field trips.
- 3 It needs to be recognised that whereas literacy and orality are two aspects of linguistic performance—expressions of linguistic competence—they are grounded in distinct cultural contexts. For a discussion of the cognitive, linguistic and expressive implications of this cultural divide see P P Sah (1980), B B Mohanty (1990). The transition from orality to literacy for the adult learner is a traumatic experience. The process is made even more arduous by the fact that access to the symbolic system within literacy does not necessarily mean the acquisition of greater economic entitlements that have been historically legitimised around literacy.
- 4 The concept of 'hegemonies' in contention and the conditions for the possibility of alternate hegemonic organisations with their 'organic' intellectuals is drawn from a reading of Antonio Gramsci (1971). For a theoretical and methodological discussion of the use of Gramscian concepts in the study of a tribal movement in Thane district, Maharashtra, see D Saldanha (1988).
- 5 One might refer to D Saldanha (1989) for a discussion of the educational implications of the transformative actions of some non-party political groups in Thane district, Maharashtra. A comparison of the approaches to literacy of these groups and that of the literacy campaigns helps to draw conclusions as regards the wider implications of a mass approach to literacy.
- 6 While the literacy campaign makes its entry

into a district and acquires a participatory consensus at various levels within it in a manner that leaves the initial structures of inequality relatively untouched, it needs to be pointed out that the initial inspiration for a mass approach emerged from the voluntary, non-government experiences of the People's Science Movements (PSM) and in particular that of the Kerala Sastra Sahitya Parishad (KSSP). The All India Jatha of May 1985 in connection with the Bhopal tragedy, the Jatha of October-November 1987 with the involvement of 26 organisations, and that of October-November 1990 covering 304 districts, have been landmarks on the way towards creating a national consensus and a mass base for literacy. The campaign approach, at the level of national communication systems and policy formulation, may thus be seen as having a grassroots basis of organised social transformation—social action that was wider than and inclusive of literacy and education. The concept of a movement for literacy then acquired a legitimacy at the Centre, primarily among administrative and academic circles and to a limited degree among the political parties. Field experience in Ernakulam, Kottayam and the Kerala state served to confirm the feasibility of this approach, so that it acquired selective legitimacy in scattered districts across the country. However, it needs to be recognised that the TLC mobilisations within districts are primarily initiated by the middle class professional elites, directed at the eradication of illiteracy and leaving the structures of oppression initially undisturbed.

- 7 There are instances where the messages of the environment building campaign and in the literacy text overtake the slow pace of literacy learning. The 'word' is translated into collective action to transform the political economy of contexts, especially where there has been some history of organised struggle. An illustration is the anti-arrack struggles in Nellore and Chittoor districts of Andhra Pradesh [see Ilaiyah 1992; Balagopal 1992 and Akash 1993]. The state has not hesitated to clamp down when the social transformative potential of literacy campaigns or of innovative educational programmes is taken to its logical conclusion, as for example in Kerala after its literacy phase, Pudukottai in Tamil Nadu, in Pondicherry and the educational programmes of Eklavya in Madhya Pradesh. (Refer to the EPW editorial of November 21, 1992 and Krishna Kumar 1992:2581).
- 8 As P C Joshi (1983:2172) points out "planning for access to culture for the masses involves planning for their access to the fruits of material production. There is thus an indissoluble bond between economic planning and cultural planning."

Stabilisation with Structural Reforms

Can the Two be Pursued Simultaneously?

Nirupam Bajpai

Developing countries are undertaking structural reforms in the midst of macro-economic instability. While most of the discussions on economic reform see growth as more or less an assured product of appropriate stabilisation and reform policies, this paper argues that simultaneous attempts toward stabilisation and economic liberalisation may lead neither to macro stability nor to the restoration of sustainable growth. In fact, the objective of stabilisation is in conflict with the objective of re-igniting growth in the economy.

Different economies with different institutional relationships and varying lines of causality in their economic systems require different approaches to stabilisation and structural reform. A case-by-case approach is required with no prior bias in favour of liberalisation.

I

Introduction

The current economic policy changes being introduced in India are a part of the so-called reform programme. This is the stabilisation-cum-structural adjustment package, funding for which is being provided by the International Monetary Fund (IMF) and the World Bank (WB). Typically it began with devaluation of the rupee in July 1991 along with measures to reduce the country's fiscal deficit, for instance, public sector disinvestment, reduction in fertiliser subsidies, and removal of export subsidies, etc. Subsequently, a host of structural reform measures have been introduced as part of this ongoing exercise. However, we are not going into the details of India's economic reform programme in this paper.

Over the years a broad consensus seems to have emerged regarding the applicability and effectiveness of this reform programme. The programme, as it was envisaged, was supposed to lay primary emphasis on stabilisation in the early stages of the process with fiscal restraint and currency devaluation taking the leading role. Having stabilised the macro-economic environment, the emphasis was then supposed to shift to structural adjustment encompassing various micro-economic and institutional reforms in order to remove inefficiencies and to ensure an adequate growth rate.

The structural adjustment programme typically requires countries to (a) liberalise trade (remove import quotas, cut tariffs, and improve export incentives and institutional support), (b) effect resource mobilisation (reform budget or taxes, reform interest rate policy, strengthen management of external borrowing and improve financial performance by public enterprises), (c) ensure efficient use of resources (revise agricultural prices, revise industry incentive system, revise energy prices, reduce or eliminate agricultural input subsidies and dissolve or reduce powers of state marketing boards), and (d)

undertake institutional reform (strengthen capacity to formulate and implement public investment programmes, increase efficiency of public enterprises and improve support for industry and subsectors) [Mosley 1987].

Simply put, the Bank and the Fund want that prices paid to agricultural producers, especially exporters, must be raised to give them an incentive to produce for the market, the financial performance of public enterprises must be improved by redirecting resources from the creation of new capacity to the maintenance of existing capital or by outright privatisation, and trade policy must become more outward-oriented by the removal of trade and exchange controls and by the reduction of effective protection against imports. The common thread running through this package is that the degree of state control over the economy must be reduced.

While controversy continues over certain specific aspects of this reform programme—for instance, over the relative importance of trade liberalisation, the urgency of financial reforms or the distributional aspects—in its broad contours, the programme appears to be widely acceptable. It clearly represents the prevailing orthodoxy in the adjustment lending of the Fund and the Bank. While the Fund has since its inception been in the business of policy reform, the Bank's Structural Adjustment Loans (SALs) were introduced in the early 1980s. Disbursement of funds under SAL programmes is always conditional on the elaboration of an appropriate set of specific actions that the recipient government will take either to increase or save foreign exchange earnings.

The plan of this paper is as follows: while Section II analyses the support that the current adjustment programmes draw from economic theory, Section III argues for stabilisation to precede structural reforms. Section IV highlights some of the conflicting objectives in such programmes. In Section V through VII we attempt to analyse the probable effects of devalua-

tion and exchange rate policy, trade liberalisation and financial liberalisation. Concluding remarks are presented in Section VIII.

II

Lacking Theoretical Support

While structural adjustment is a multifaceted process, the current practice at the Bank and the Fund emphasises the role of economic liberalisation, or in other words what is often termed as 'market-oriented reform'. The case for economic liberalisation is based on the argument that allocative efficiency can be improved by lifting controls in markets for commodities, credit and foreign exchange. The removal of price distortions is expected to enhance efficiency by calling forth an appropriate behavioural response. By contrast, we argue that this orthodox 'neoclassical' or 'monetarist' approach with particular emphasis on economic liberalisation may not be the right approach. Removing distortions should produce a once-and-for-all gain in the efficiency of the economy because of a reallocation of resources to the sectors where they are most productive at world prices [Krugman 1989]. Such a reallocation can explain only a one-time gain, however, not a continuing process of growth. Also, it cannot explain why the efficiency of resource use within sectors should rise.

Hjalmarsson (1991) and UNCTAD (1991) show how the irrelevance of liberalisation to growth can be dissected in terms of two distinct notions of 'allocative' and 'productive' efficiency. The latter is by no means assured by putting the former into place. There are numerous other factors which affect productive efficiency, for example, market and capital stock structures, resource endowments as defined by changing technology and tastes, the size of the economy, access to geopolitically determined capital inflows and penetrable markets, etc.

It follows from above, therefore, that the increases in GNP can be registered while the one-time reallocation of productive factors lasts and hence it may be incorrect to presume that liberalisation can raise the rate of growth over the medium to the long run. However, one comes across overwhelming literature favouring across-the-board liberalisation to attain and more importantly sustain higher levels of economic growth. Unlike what much current practice might lead us to believe, economic theory is generally silent about the effect of liberalisation on the rate of growth of an economy. In this regard, it is significant to distinguish between (a) an increase of, say, 2 per cent in GNP every year, and (b) a permanent increase of 2 per cent in the growth rate of GNP. The economic theory underlying the case for liberalisation makes a claim only regarding the first scenario. The practical difference between the two scenarios can be observed by noting that an economy with an underlying growth rate of 4 per cent a year will have a GNP under scenario (b) that is almost one-fifth larger at the end of a decade than under scenario (a) [Lucas 1989]. While no one would deny that inefficiencies need to be removed, the commonly known ones are level effects, but not growth effects.¹ Since there is lack of theoretical support to establish the link between economic liberalisation and the attainment of higher growth (over the medium to the long run) the linkages between the instruments and the targets in the currently prescribed reform programmes seems to be rather weak.

III

Stabilisation to Precede Structural Reforms

Although both the Fund and the Bank have been emphasising that macro stability should be attained before structural reform measures are undertaken, in practice, however, both stabilisation and structural reforms are found to be going on simultaneously. Experiences of a number of countries with Fund-supported programmes has shown that attaining macro-economic stabilisation on monetarist principles in the short run is no longer feasible. This has been particularly so because getting the public sector budget on a sustainable course has proved to be extremely difficult. Table 1 provides an idea as to how the stabilisation programmes have fared. For instance, in sub-Saharan Africa, the budget deficit/GDP ratio increased from being 6.5 per cent before implementing the programme to 7.5 per cent after the programme. Also, it increased in the highly indebted countries from 4.2 per cent to 7 per cent.

Stabilisation as per the Fund's approach neglects crucial macro-economic factors, such as, the linked foreign exchange and fiscal constraints, financial fragility, and the dynamics of the inflation process. Current account deficits have been reduced by introducing deep cuts in domestic investment, however, this is neither an indicator of macro stability, nor is it a recipe. The investment/GDP ratio for sub-Saharan Africa fell from 20.6 per cent before the programme to 17.1 per cent after, and similarly in the highly indebted countries it fell from 23.1 per cent to 17.9 per cent. Implementing structural reforms in the backdrop of macro-economic instability is likely to aggravate the problem further and make it more difficult for the concerned governments to finance their deficits in a non-inflationary manner [Bajpai 1992].

The conventional benefits of economic liberalisation become muted, if not completely offset, under conditions of macro instability characterised by high and variable inflation on the one hand, and fiscal and balance of payments crises on the other. Trade reform, for example, is expected to work by reducing the distortions in the structure of relative prices and by directing resources to sectors that can make the best use of them, however, macro-economic instability interferes with both. High and variable inflation serves to confound price signals by making it difficult to disentangle relative price changes from movements in the price level. Also, the slowdown in the domestic activity renders structural change more painful by exacerbating transitional unemployment. From the sustainability point of view, trade liberalisation may lead to greater macro instability. With the removal of import quotas and significant cuts in tariff rates, imports would rise considerably at a time when stabilisation requires a reduction in the demand for imports.

IV

Conflicting Objectives

The multiplicity of objectives in the structural adjustment programmes have frequently led to conflicts among some of them. Besides, explicit trade-offs between conflicting objectives and the degree of complementarity between the others is not made clear [Bajpai 1990]. For instance, some of the conflicting objectives are: (a) trade liberalisation vs reduction in BoP deficit/reduction in budget deficit, (b) privatisation vs liberalisation of interest rates/increase in tax revenue, (c) decreasing or eliminating subsidies vs improving income distribution, (d) devaluation vs reduction in inflation and (e) devaluation vs output expansion.

Trade liberalisation has been a significant part of a number of SAL operations.² In such cases the Bank has asked for the elimination of quantitative restrictions (QRs) and cuts in tariff rates. Trade liberalisation is in conflict with the objective of reducing balance of payments deficit and the budget deficit. Tariff reductions would result in reducing government revenue and simultaneously increasing the import bill. This, in turn, would naturally increase both the balance of payments deficit and the budget deficit, hence the conflict. Similarly, the objective of privatisation is in conflict with the objectives of liberalisation of interest rates and increase in tax revenue. The two latter objectives curb private investment and are therefore subject to an inherent conflict. Reforms in the interest rate policy can reduce the rate of investment, particularly in the short run, and similarly an increase in tax revenue can be instrumental in reducing the funds for investment, thereby defeating the objective of privatisation.

A frequently sought for policy measures in return for SAL finance is the reduction or in some cases the elimination of food or some agricultural input subsidies. However, reducing or eliminating such subsidies has a direct bearing on the prevailing income distribution. The abolition of food and fertiliser subsidies leads to an increase in the prices and hence brings down the real income. As a consequence of this policy measure, the income distribution becomes even worse than what it had been in the pre-programme period. There may well be production limitations to subsidy programmes, unless foreign exchange is readily available or the state intervenes actively to shift the food supply curve out by providing inputs to agriculture. Food subsidy schemes, on the other hand are politically attractive, and difficult to dismantle once in place. Furthermore, another problem coming from the food markets is their potential effect on inflation. With food constituting a major proportion of the national consumption basket, agricultural price increases will reduce the real wage and set off inflation in non-agricultural products.

Finally, devaluation of the national currency seems to be in conflict with the objective of output expansion. Bruno (1979), Krugman (1989) and Taylor (1978) suggest that devaluation in fact is contractionary. The former, for example, discusses a number of supply side channels through which devaluation has a negative impact on output. Since most developing countries have to import capital goods on a large scale and where most domestic firms have to rely on banks for their capital requirements (capital availability being subject to rationing) a sudden devaluation

raises both their import costs and the need for working capital. In these circumstances, however, the entrepreneur has no choice but to approach the informal loan market. With a steep rise in the demand for funds, the rate of interest rises considerably in the informal loan market. Hence, higher import costs and capital costs force the firms to cut on their production. The negative impact from the higher cost of imported inputs will weigh against the production stimulus from higher relative prices for domestically traded-goods. In the event of some delay in realising the positive effects of devaluation, the negative impact of higher cost imports on aggregate supply may dominate in the short run.

V

Devaluation and Exchange Rate Policy

The Fund-supported adjustment programmes bear testimony to the fact that devaluation is increasingly being used as a stabilisation tool. The 'orthodox' view has maintained that devaluation plays a positive and indeed an important role in balance of payments stabilisation [Dornbusch 1988]. This is achieved through the expenditure switching effects of devaluation and the increased production of tradables. However, the role of exchange rate policy in economic adjustment has become the subject of considerable debate over the years. For instance, while the Fund/Bank view is that devaluation is expansionary and essential to maintain a competitive exchange rate, the 'Structuralist' school is of the opinion that it is contractionary. Intermediate import costs go up due to devaluation in the short run and consequently final goods through mark-ups. Real wages are cut due to higher prices and the country's purchasing power is reduced initially as import payments exceed export earnings.

The co-ordination of devaluation with other policies is also problematic in the context of both stabilisation and adjustment. For anti-inflation purposes, the exchange rate may be frozen as a nominal anchor. Of course, if inflation continues there will be real currency appreciation, and consequently imports will rise and export growth decline thereby upsetting the real side of the economy as was the case in numerous failed stabilisation attempts in Latin America over the past two decades. With regard to fiscal policy, if devaluation is expansionary then it can usefully be combined with austerity since the exchange rate change improves the trade balance, while fiscal policy helps to avoid an inflationary excess demand situation. However, in the event of devaluation being contractionary, which is most often

the case, combining it with fiscal austerity may lead to disastrous results.

Furthermore, devaluation by itself cannot improve the trade performance. Getting rid of extreme price distortions appear to be a necessary condition for (or at least correlated with) greater tradability of domestic activities. However, mere price incentives are never sufficient for improvement in trade performance. A real exchange rate with a reasonable and stable value is an invaluable stimulant to net exports. Of course, it must be supplemented with directed trade promotion policies, such as, tax drawbacks, export subsidies, and cheap credit, etc, as well as state intervention to improve infrastructure and the overall economic environment. The real exchange rate could be held stable by following a crawling peg policy involving frequent nominal mini-devaluations to keep the exchange rate in line with the domestic price level.

While devaluation of an overvalued currency along with adequate fiscal management is important for macro-economic stability, under certain circumstances, where exchange rates that are too flexible can be destabilising. For instance, when non-traded goods are a net source of revenue for the public sector, real devaluations increase the budget deficit, and may on the contrary make it more difficult to attain macro-economic stability [Rodrik 1988]. Country studies in Taylor (1988) suggest that devaluation often leads to stagflation, i.e, rising prices and falling output, particularly for a year or more after having devalued. By contrast, the Fund/Bank view that not only is devaluation expansionary, it may not even cause inflation if, for instance, 'rents' on import quotas make up a substantial share of income. The underlying argument being that raising import prices will just wipe out rents.

There exists a strong case for devaluation if the exchange rate is seriously overvalued. This is simply because it is ex-

tremely difficult to run an open economy if the exchange rate is badly out of line. While, if the real rate is approximately correct then a case can be made against devaluation more rapid than the current inflation rate because of the possible stagflationary effects. Lastly, the Fund seems to be convinced that by the time countries initiate a stabilisation programme there is overvaluation of exchange rates, and that currency devaluation is the first medicine to be prescribed. Contrary to this view, Taylor (1988) is of the view that exchange rate is not always out of line at the beginning of a stabilisation programme, and that a sudden devaluation might only aggravate the existing problem of macro instability in the economy.

VI

Trade Liberalisation

Trade policy reform is perhaps one of the most crucial components of the currently pursued adjustment strategy. It is argued that developing countries need to move away from a distorted trade policy regime towards a more neutral one. As part of the move toward a more liberal regime, a standard sequence of policies is recommended: first, there should be macro stability, thereafter, quotas should be converted into tariffs, and then the tariff schedule should be simplified to two or three rates in the 10-50 per cent range, sufficient to provide some protection and generate revenue.

The underlying argument for a liberal trade regime is that efficiency gains would be higher in such a regime, however, from the sustainability point of view, trade liberalisation may lead to greater macro instability. With the removal of import quotas and significant cuts in tariff rates, imports would rise considerably at a time when stabilisation requires a reduction in demand for imports. As mentioned in Section IV, the objective of trade liberali-

TABLE: MACRO-ECONOMIC INDICATORS IN 30 COUNTRIES WITH ADJUSTMENT PROGRAMMES

	Low Income	Middle Income	Sub-Saharan	Highly Indebted Countries	Manufacturing Exporters
Budget deficit/GDP					
Before	7.6	6.0	6.5	4.2	4.4
After	7.6	5.7	7.5	7.0	3.4
Current account/GDP					
Before	-9.0	-7.2	-9.4	-6.9	-5.0
After	-7.0	-4.5	-6.5	-3.7	-2.6
Investment/GDP					
Before	19.2	24.7	20.6	23.1	25.0
After	18.1	19.2	17.1	17.9	22.0

Note : 'Before' and 'After' refer to the three-year periods preceding and following the first World Bank adjustment loan received by the countries in question

Source: World Bank Report on Adjustment Lending, 1988.

sation is in conflict with the objective of reducing balance of payments deficit. Although this conflict can be resolved by the exchange rate policy, it will only be at the risk of complicating the task of macro-economic management by increasing the number of objectives the exchange rate is called to fulfil.

Several authors including Dornbusch (1989), Krugman (1989) and Rodrik (1989) suggest that on account of both over-borrowing and under-investment trade reforms lacking credibility may prove difficult to sustain. In such a scenario, the existing macro instability will come under further stress and in addition may even force the government (even those committed to economic reform) to abort the reform process. Also, the consequent delay in economic restructuring may block the emergence of new political alliances in favour of reform. Consequently, a stage is set for a potential multiplicity of equilibria. In one, the economy is stuck in a bad equilibrium with low investment and a high probability of reform collapse while in the other the outcome is more favourable. Depending on imponderables, however, the economy can end up in either one of the two, implying thereby that there may be a large degree of indeterminacy with respect to the success of reform.

Since the effect of import liberalisation on export performance can be weak and more importantly quite delayed the trade balance may be found to be worsening at a fast pace. By contrast, successful experience of South Korea and more recently Turkey have shown that policies focusing directly on exports, such as, import quotas and export subsidies may be a better alternative than trade liberalisation and currency devaluation. Of course, both South Korea and Turkey have liberalised their imports, but only after their exports had risen sufficiently. Also, Colombia and Kenya have proved to be successful exporters following similar policies.

Reform of incentives for production of exports and imports competing goods has been a significant feature of almost all the adjustment programmes of the Bank. On the export front, emphasis has, in addition to exchange rate policy, been placed on mainly two areas. These are: provision of financial incentives through tax rebates, subsidies on imported inputs to offset import controls, and preferential access to imports and credit. The other area is reform of administrative procedures and the establishment of better institutional support for exporters. While on the import substitution side, protection has been reduced to encourage efficiency and better exploitation of comparative advantage.

As mentioned in Section IV, the objective of liberalising the trade regime is in conflict with the objective of reducing the

budget deficit. When trade reform is undertaken, it is important to keep an eye on the underlying fiscal crisis. Farhadian-Lorie and Katz (1988) argue that trade taxes constitute a large chunk of government revenue in developing countries, there is need to tread very carefully as far as cutting tariffs is concerned. In Mexico, for example, the trade reform reduced by half the share of trade taxes in the total government revenue and magnified the requisite fiscal retrenchment. Moreover, in Thailand and Morocco, tariff reductions were ultimately reversed, to a large extent, for budgetary reasons. Briefly put, the standard rules of a trade reform programme tend to neglect certain crucial aspects about the underlying economy. Typically, tariffs are ignored as an important source of revenue for the government and also the fact that there may be other domestic taxes in the system. Finally, the reform programme also ignores that imports and domestically produced goods in the same sector may not be perfect substitutes.

VII

Financial Liberalisation

Liberalisation of the financial sector is also one of the important components of the currently pursued adjustment strategy. According to the Fund/Bank view, various measures relating to financial liberalisation need to be undertaken after the economy has attained macro stability. However, as discussed earlier, since stabilisation has proved to be a long-drawn process, structural reforms irrespective of whether in the trade or financial sector are being undertaken in the midst of macro-economic instability.

The process of financial liberalisation, according to the Bank, comprises of three stages. The first stage involves reducing directed loan programmes, making adjustments in the interest rate structure and improving institution-building. The second stage includes measures, such as, establishing a broad range of deposits and lending rates, developing institutions and financial markets and permitting entry of foreign institutions into domestic financial markets. The third and final stage includes fully deregulating interest rates, eliminating directed loan programmes, removing controls on capital movements and allowing entry of foreign institutions without restraint.

While sequencing of these measures have their own significance, an important pre-condition to be met before implementation is the establishment of an environment of macro stability. The experience of Latin American countries has shown that removing interest rate ceilings, broadening the asset menu faced by the

households and liberalising the capital account of the balance of payments have been implemented with little regard to their consequences for macro stability and sustainability. The case of Uruguay is a fine example in this regard. While financial liberalisation after 1974 created considerable financial deepening it also went hand-in-hand with a reduction in private savings. De Melo and Tybout (1985) suggest that this appears to have been due to the consumption binge stimulated by an appreciating real exchange rate. This is a case in point to show how the allocative effects of price reforms can be easily swamped by the consequences of macro disequilibrium.

Financial reforms involve changes in relative prices that need to be assessed and absorbed. When such reforms take place in an environment of general price instability it is indeed difficult to determine appropriate interest rates and to interpret them after the reform. The experiences of failed liberalisation in Argentina, Brazil, Colombia, Mexico and Uruguay suggest that without macro stability it is very difficult to achieve the level of interest rates that are well aligned with the real sector's productivity, no matter whether interest rates are market determined or regulated.

Undertaking financial reforms at a premature stage can lead to numerous problems. For instance, opening financial markets prematurely can result in volatile financial flows. Similarly, allowing free entry of financial institutions can lead to disintermediation of high-cost domestic banks. Moreover, undertaking measures relating to financial liberalisation implies giving up a large degree of autonomy in the domestic monetary and financial policy. Removing interest rate ceilings frequently puts the financial sector in a frenzy and ultimately causes it to crash, as Carlos Diaz aptly summarised the Latin American case, "good-bye financial repression, hello financial crash"—an experience which has since been repeated in other continents.

Mckinnon (1973 and 1982) and Dornbusch (1983 and 1984) have suggested that opening the capital account of the balance of payments will result in large destabilising capital flows in the short-run. If the capital account is opened when the domestic capital market is still repressed and interest rates are fixed at artificially low levels, massive capital outflows will take place. For this reason, most if not all the authors who have discussed this issue have indicated that the capital account should be opened only after the domestic capital market has been liberalised and domestic interest rates have been raised. Furthermore, capital account liberalisation raises the cost of financing the deficit as it reduces the private sectors' demand for

government liabilities. In addition, when the real exchange rate is maintained on a downward path for reasons of remaining competitive, a premium is built into domestic real interest rates relative to foreign rates, thereby adversely affecting the domestic investment.

VIII Concluding Remarks

The experiences of different countries with similar stabilisation and reform programmes have shown a spectrum of results when applied in the historically diverse circumstances of the third world. Perhaps, it would not be wrong to say that the outcomes of this orthodox approach have ranged from moderately successful to disastrous. Broadly, a standard package of reform measures (with minor changes between one another) for different countries does not appear to be relevant in the context of developing countries. Perhaps different economies with different institutional relationships and varying lines of causality in their economic systems require different approaches to stabilisation and structural reform. Indeed, a case-by-case approach is warranted with no prior bias in favour of economic liberalisation.

While most of the literature on stabilisation and structural reform in developing countries is of the view that economic growth is more or less an assured product of appropriate stabilisation and reform policies, there is no guarantee, however, that sustainable growth can be achieved. Simultaneous attempts toward stabilisation and economic liberalisation may lead neither to macro stability nor to the restoration of sustainable growth. In fact, the objective of stabilisation is in conflict with the objective of reigniting growth in the economy. Adjustment is necessary, but not necessarily a sufficient condition for the resumption of growth, because asset holders may postpone repatriating flight capital, and investors may delay initiating projects.

Since the currently implemented adjustment programmes emphasise the role of economic liberalisation, it is important to study the impact of liberalisation on growth. Theoretically, however, there is little support behind this strategy. A sample of differing models and views Krueger (1978), Lal and Rajpatirana (1987), Sachs (1987), Taylor (1988), Grossman and Helpman (1988) and Rodrik (1989) suggest arguments that can be constructed to satisfy both sets of possible prejudices but the empirical evidence is not as clear cut as it is sometimes presented. Since reigniting growth is the main objective of the structural reform programme, and economic liberalisation being the main policy tool, one is left with a wide gap between the policy instruments and targets.

The orthodox approach has a number of limitations and moreover does not seem to be relevant for the wide variety of conditions prevalent in the developing countries. By contrast, countries have to devise their own strategies keeping in mind their socio-economic set-up. Since structural adjustment is a multiple-objective and multiple-instruments programme, there are conflicting objectives. While some of these conflicts are transitory, most of them are not. On the other hand, some of the instruments are called in to fulfil a number of objectives, for instance, the exchange rate policy is one such example. In such cases, however, the task of macro-economic management becomes much more complicated. Briefly put, the currently-pursued approach for attaining macro-economic stabilisation on monetarist principles in the short run and structural reform on neoclassical price-fixing in the long run does not appear to hold much ground.

Notes

[The author is grateful to Pronab Sen and Lance Taylor for their comments.]

- 1 The level effects being the changes that raise or lower balanced growth paths without affecting their slope and the growth effects being changes in parameters that alter growth rates along balanced paths.
- 2 Trade policy reform in selected developing countries; Bolivia: Trade regime is overhauled in 1985, and quantitative restrictions (QRs) are eliminated. Two basic tariff rates exist, 10 per cent for capital goods, and 17 per cent for others. Brazil: Major trade reform announced in March 1990 as part of the Collor stabilisation package. Almost all QRs are to be phased out and replaced by tariffs. An average tariff rate of 20 per cent is sought by 1994. Jamaica: QRs are eliminated and tariffs lowered to 20-30 per cent for most items. Peru: All QRs are eliminated, and the tariff system was simplified to include three rates (10 per cent, 25 per cent, and 50 per cent) only. In March 1991, the top rate was reduced to 25 per cent. Poland: Foreign trade is de-monopolised. All QRs on imports and licensing on imports were abolished by beginning of 1990. Tariffs average 13-14 per cent.

Russia's Sinking Economy: External Dimensions

Nirmal Kumar Chandra

In these notes prepared on the eve of the referendum in April, the author surveys the data and also views on the external economic scenario for Russia.

Foreign trade and balance of payments are taken up in Section I. Illegal transactions and capital flight from Russia are described next. Section III is on mafias, corruption and the weakness of government regulation of the economy. The following section is about who and what have been responsible for the crisis and then, after a critical examination of the views expressed in the western media, the current debate in Russia on ways out of the crisis is summarised. The final section of the paper is devoted to the crucial oil sector.

JUST as no clairvoyant could foresee the manner and speed with which the political map of east Europe and the ex-USSR was transformed since 1989, no less puzzling and unpredictable has been the economic disintegration in these parts of the world.

Yeltsin was elected president of Russia in 1991 with a significant majority at the polls, while Russia was still part of the USSR with Gorbachev as the president. Shortly after the abortive coup of August 1991, the USSR ceased to exist, the Soviet Communist Party was banned, and Yeltsin took charge of the Russian government. Within a few months the plan for quick transition from a centralised socialist to a market-oriented private capitalist economy was elaborated by the Russians with the help of the IMF and the World Bank; the Harvard professor, Jeffery Sachs, who had earlier administered the 'shock therapy' in Poland, became adviser to the Russian government.

New policies implemented since the beginning of 1992 have had disastrous consequences to this date. Whether or not these will turn out to be no more than the Schumpeterian 'gale of creative destruction' heralding a bright new future, only history can tell. By late 1992, Yeltsin's popularity was sagging, many of his erstwhile colleagues like vice-president Rutskoi and head of parliament, Khasbulatov, turned into political foes, and parliament intervened on many issues. On February 21, 1993 the All-Russia Officers' Assembly met in Moscow, although defence minister Grachev had declared it illegitimate; the gathering unanimously voted for the latter's resignation, and qualified the Yeltsin government as an 'occupation regime' [Zhilin 1993]. In March there was an attempt to have Yeltsin impeached by parliament; though his opponents were in a majority, it was not large enough. The impasse was 'resolved' for the time being by both sides agreeing to a referendum (April 25) on Yeltsin, his economic reform, and early elections for both a new president and a new parliament.

Realising the plight of Yeltsin and his supporters, the western powers led by the US have thrown their full weight behind him; Japan, which was earlier demanding a return of the Kyril Island taken away by the USSR at the end of World War II as a precondition, was compelled to fall in line. The foreign ministers of the G-7 countries agreed in April 1993 on an unprecedented \$43.4 bn aid package for Russia, including \$4.1 bn as initial support, \$10.1 bn for the full stabilisation programme, \$14.2 for structural reform and essential imports, and \$15 bn in debt relief; of the total, \$13.1 bn are expected from the IMF, \$4.5 bn from the World Bank, and \$1.8 bn from the US. There is a \$6 bn component to stabilise the rouble, i.e., to bring down the Russian inflation rate (2,600 per cent in 1992) and arrest the fall in the exchange rate (from 70 rb/\$ in February 1992 to 712 rb/\$ in early April 1993). In 1992 the west had promised \$24 bn in aid, but only \$13 bn were actually disbursed due to the non-fulfilment of different conditionalities. For the current year, the first tranche will be disbursed after the west is convinced that Russia was adopting an 'appropriate adjustment' policy (presumably after Yeltsin wins the referendum of April 25), while the second tranche will be offered after inflation in Russia is 'contained'. The G-7 believes that the 1992 hyperinflation was triggered off by the Central Bank (controlled by Yeltsin's adversaries in Russian parliament) going on 'a credit spree', and hopes that after the referendum Yeltsin will gain control of the Bank (*The Economic Times*, April 16, 1993 and April 24, 1993). The pro-Yeltsin press in Russia is jubilant, hoping that western backing will help Yeltsin to win the mandate.

For the anti-Yeltsin camp the aid package is hardly a blessing. Rutskoi thinks that 'the Yeltsin regime is responsible for the economic mess resulting in acute misery for the people, a catastrophic decline in industrial production and investment, extremes of ill-gotten wealth ac-

cumulated in a few hands, and a massive flight of capital that has impoverished the country. Western aid to Russia with Yeltsin at the helm will bleed the country ever more.

The west has made it clear that 'everything would be open if Yeltsin were no longer in power'. An expert on Russia at the Deutsche Bank's Research Institute, A Gummich, has warned: "Domestically, it makes him [Yeltsin] look like the west's president. It could make him more enemies than friends." Gummich was sceptical that Russia was in a position to make proper use of the aid offer (*The Economic Times*, April 24, 1993).

Meanwhile, Yeltsin in Russia is campaigning in American style, hiring the services of the British advertising firm, Saatchi and Saatchi, and spending at least 100-150 mn rb or \$125-190,000 on the campaign (against an average monthly salary of \$30) contributed by his Russian business supporters. Nearly as much was raised by two American businessmen in Moscow who organised a \$1000-a-plate dinner, in support of Yeltsin (*The Economic Times*, April 24, 1993).

In these notes prepared on the eve of the referendum, I survey the data and also views on the external economic scenario for Russia. Foreign trade and balance of payments are taken up in Section I. Next, I describe the illegal transactions and capital flight from Russia. Section III is on mafias, corruption and the weaknesses of government regulation over the economy. The following one is about who and what are responsible for the crisis; after a critical examination of the views expressed in the western media, the current debate in Russia on ways out of the crisis is summarised. The final section is devoted to the crucial oil sector.

I

How precarious is the external economic situation in Russia today? Consider first the trends in foreign trade. In Table I are given the data for 1980, 1985

and 1988-90 in the traditional *valyutnye* (foreign exchange) roubles (VR). Export reached a peak of 72.7 bn VR in 1985, well above the 1980 level. After 1985 there was a slow deterioration up to 1989, but then in 1990 there was a significant 12 per cent fall. Most marked was the contraction in the 1990 trade with the CMEA (Council for Mutual Economic Assistance) partners by 16 per cent against 1989, or by 19 per cent over 1985, owing to the political and economic turmoil in east Europe. Export to the developed capitalist countries also fell in 1990 by just 5 per cent against 1989, and by over 16 per cent against 1984; this was the consequence of disruption in Soviet supplies of oil and other raw materials. As for the two minor groups, 'other socialist countries' and 'developing countries', Soviet export remained steady at 12-13 bn VR during 1985-90. Among the individual commodities, export of crude oil declined sharply from a peak of 144 mn tons in 1988 to 109 mn tons in 1990.

As for import, Table 1 indicates a 55 per cent increase in the first half of the eighties, followed by a stagnation in the second half; the same is broadly true for import from the CMEA, the west, or the developing countries. The trade balance which was generally positive but small up to 1988, turned negative at 3.3 and 9.8 bn VR respectively in the last two years. With the western countries there was a consistent and rising deficit (in bn VR) from 0.5 in 1985 to 6.6 in 1990. Against developing countries, however, the USSR maintained a trade surplus.

In view of the bilateral arrangements of the USSR *vis-a-vis* the CMEA, the other socialist countries and many developing countries, the exact balance of payments picture is unclear. However, the Soviet trade surplus with the developing countries could not have been utilised to finance the deficit with the CMEA or the west; the surplus suggests that the USSR continued to provide machinery and/or arms to the third world on credit till 1990. Of course, the trade deficits with the west had to be financed by hard currency borrowings.

What was the hard currency or dollar equivalent of the trade flows? In 1989, the Soviet official exchange rate was 0.62 rb/\$. Can the trade flows in Table 1 be converted into dollars at that rate?

For the first time, to my knowledge, the Goskomstat (State Statistical Commission) published in 1992 the Soviet balance of payments for 1990 as well as 1991 as shown in Table 2. Here the exchanges are shown separately for three currency areas, namely, those with convertible currency, the CMEA with 'transferable rouble', and

those coming under barter or 'clearing' arrangements. If one assumes that trade with the west was exclusively in hard currency, and did not involve any barter, one can work out from Tables 1 and 2 that the conversion rate of the dollar in 1990 was 0.62 VR for export, but much higher at 0.78 VR for import. But the assumption is not valid, since a part of the Soviet trade with the west was actually in the form of barter. For the CMEA the corresponding rates in VR/\$ were 0.50 for export and 0.46 for import. However, the rates for aggregate export and import were identical at 0.59 VR/\$, that is, just 5 per cent below the 'official' rate. Thus it is not possible to recast the data for earlier years in the format used in Table 2. But this does not affect the trends noted above for each group of countries in Table 1.

A study by Grabisch of the reputed Vienna Institute for Comparative Economic Studies put the value (in VR bn) of Soviet export and import at 36.6 and 41.0 respectively in 1990, and 64.2 and 44.7 respectively in 1991. Moreover, it was suggested that for the first quarter of 1991

the export value of 9 bn VR could be converted at the then 'commercial' exchange rate of 1.677 VR/\$ to arrive at the US dollar magnitude of 5.4 bn [Grabisch et al 1992: 85-87]. If our Tables 1 and 2 are to be trusted, Grabisch was misled by his sources on two counts. The trade turnover was much larger than what Grabisch depicted; and the 'commercial' rate was not applied to Soviet official statistics on trade flows, either for 1990 or for 1991. I do not know what role, if any, the commercial rate played.

Moving to Table 2, there was a precipitous fall in Soviet foreign trade in 1990-91 by one-third in export, and 44 per cent in import. Most drastic was the fall in trade with the CMEA partners; export crashed to less than one-half, and import to almost a third. The turnover in hard currency fell by 13 per cent, and in barter trade by 19 per cent.

When one comes to Russia (Table 3), the figures are alarming. In 1990-91 total trade shrank by two-fifths: with the CMEA by three-fifths, in hard currency by 11 per cent, and in barter by 21 per

TABLE 1: FOREIGN TRADE OF THE USSR, 1980-90

* 'More than double the proposed G-7 aid of \$43 bn.'

cent. Import fell much more sharply than export, and consequently Russia had a sizeable trade surplus of \$9.1 bn, including \$4.8 bn each in hard currency and in barter trade, counter-balanced by a small deficit with the CMEA.

During the first nine months of 1992, as shown in Table 4, the crisis in Russia deepened. The export values, as noted therein and explained below, need correction; if the corrected figure is annualised, the total for 1992 comes to \$32.7 bn which is just a little higher than the actual \$31.7 bn cited by vice-president Rutskoi (*The Statesman*, April 13, 1993), implying a 42 per cent fall against 1991. Annualised import fell by 25 per cent only. During 1992 trade with the CMEA countries came down to a trickle as all transactions were in hard currency. Barter trade also suffered heavily, the turnover declining by 37 per cent; trade with India, it is well known, came to a virtual standstill during the whole of last year. Even gold exports in 1992 could not be maintained at the previous year's level.

Provisional data obtained unofficially from the Goskomstat and published in the *Izvestiya* (March 31, 1993) belie the earlier forecast of the Economics Ministry that the downside will be gentler in 1993 than in 1992. Trade results for the first quarter of 1993 against the same period of 1992 showed that export fell by 19 per cent and import by a staggering 58 per cent.

If one compares Russia's 1992 trade with that in 1990, the gravity of the situation comes out more clearly. Export, assuming Rutskoi to be correct, fell by over 60 per cent, and the same was true for annualised import. By contrast, trade in hard currency fell by only one-quarter, and that in barter by one-half. The loss in CMEA trade was more severe. Assuming that the trend for Russia paralleled that of the USSR during 1980-90, overall decline since the mid-80s was bigger still. For any country, however self-sufficient it might be, such a big drop in export and import over a few years would be a severe blow.

Here one must enter a caveat. As noted underneath Table 4, Russia's trade with the 'near abroad' are excluded. It is a fact that large volumes of import into and export from Russia were routed through these countries. Hence the 'effective size' of foreign trade in terms of domestic employment or output in the Russian export sector, or the availability of imported goods, was not as bad as the trade figures suggest. Most of the flows through the 'near abroad' were, however, a dead loss for the Russian balance of payments and/or the state budget.

Of the merchandise trade in Table 4, export on 'barter' and 'clearing arrangements' accounted for \$8.1 bn, or 29 per cent of the total; the corresponding figures for import are \$5.2 bn and 20 per cent. The barter trade leaves enormous scope for manipulation; under-invoicing of export (estimated by Goskomstat) and manipulation of the volume of foreign-credit-financed natural gas export (estimated by MOFER) led to an exchange loss of \$2.9 bn and \$1.2 bn respectively. As a proportion of the total under barter, the loss is over 50 per cent, which is extraordinary by any yardstick. After these corrections, the balance of merchandise trade shows a deficit of \$2.2 bn against a nominal surplus of \$1.9 bn. Although MOFER believes that the extent of barter is higher at 40 per cent, including that

camouflaged under export-import deals, it has not indicated the magnitude of the additional loss of foreign exchange for Russia.

The item, 'services', includes cost of freight and insurance for merchandise trade, maintenance of embassies, contribution to international agencies, etc. Due to the absence of data, the hard currency component of the total is not known. Further, the item covers the operations of the Aeroflot and the Ministry of Shipping, a part of which takes place under 'clearing arrangements'; the loss of exchange, if any, on this score is not known.

How did the external debt situation evolve? Here I shall pass over the non-trade transactions of the USSR with the CMEA which are briefly described in

TABLE 2: USSR'S BALANCE OF PAYMENTS, 1990 AND 1991

Notes : (1) With the CMEA countries, the current a/c deficit of 16.7 and direct investment outflow of 0.7, were financed by the VEB's short-term borrowing of 17.4 in 1990; the corresponding figures were 1.8, 0.3 and 2.1 in 1991.

(2) The clearing trade surpluses of 0.4 in 1990, and 1.7 in 1991 were deemed as short-term credits from the VEB.

(3) Row (4) above appeared in the source publication as part of the 'capital balance'.

Source: *Foreign Trade*, 1992/2, p 40; prepared by Goskomstat, with corrections by the Ministry of Foreign Economic Relations (MOFER).

Table 2, and concentrate on those in hard currency. In 1990 the Soviet current account deficit of \$5.1 bn was predominantly due to interest payments to the tune of \$4.7 bn; not all of it was actually paid. On capital account the Soviets should have repaid \$8.2 bn as principal on earlier loans. Against a total of \$12.9 bn of debt-servicing, the amount overdue (item 8) was \$4.5 bn, and foreign assets fell by \$1.7 bn; it appears that the balance of \$6.7 bn was paid out of the new credits of \$10.9 bn obtained during the year. Thus the USSR was well into the external debt trap by 1990, borrowing largely to service the debts.

The situation was at first sight much better in 1991 when the current account deficit, including interest obligations of \$4.2 bn, was only \$1.8 bn. The USSR was again due to pay back \$8.2 bn on amortisation so that debt services amounted to \$12.4 bn; overdue payments and the amounts carried over (items 8 and 9) actually declined by \$500 mn, and foreign assets fell by \$3.1 bn, while new loans amounted to \$12.0 bn. Once again new debts helped to pay off the old ones.

The authors of Table 2 also published a comparable one pertaining to Russia alone, allotting to her 61 per cent of the USSR's external liabilities and assets; this was in accordance with the initial agreement struck between the newly sovereign states belonging to the ex-USSR. However, at the insistence of western powers most worried about the safety of their loans, Russia as the successor state assumed, with the concurrence of others concerned, full charge of Soviet debts and credits. Hence Table 3 shows the trade flows only. What has been said above on the USSR's debt-related transactions applies to Russia.

During the first nine months of 1992, Russia should have repaid western creditors \$7.44 bn on the principal, and \$2.7 bn by way of interest; the actual sums paid were over \$1.0 bn and \$391 mn respectively. Of the unpaid principal, \$3.2 bn was officially rescheduled, and another \$3.2 bn became 'overdue'. The non-payment of the scheduled amounts on principal and interest should have augmented Russia's debts by about \$8.7 bn.

On the credits extended by the USSR, Russia was due to receive as much as \$12 bn as debt-service; actually she got only \$1.2 bn or 10 per cent, mainly from developing countries. Most of the Soviet credits, it is widely thought, are unlikely to be repaid [Grabisch et al 1992: p 85].

Russia obtained from the west, according to Vneshekonombank (Foreign Trade Bank), fresh credit of \$8.9 bn up to September 1992; of these, 84 per cent was

of medium to long duration, including \$1.3 bn of grain loan from the US. An unspecified part of the western credit went to other states of the ex-USSR; it is reckoned with in the 'errors and omissions' of Table 4, and should not affect the overall picture depicted therein.

With the abolition of the state monopoly over foreign trade and foreign exchange holding, the central bank disposes of only a small part of the reserve; the government, namely the ministry of finance, has none at all. The rest of Russian assets abroad is with individual enterprises, including authorised commercial banks, which use them to meet their current and long-term goals. The short deposits held abroad by the latter increased from \$2.5 bn on January 1, 1992 to \$6.3 bn on October 1, 1992, i.e. by \$3.8 bn.

Finally, the item, 'errors and omissions' in Table 4, includes apart from the usual statistical discrepancy and the utilisation of fresh western credits by non-Russian members of the ex-USSR, also capital flight from Russia due to the retention abroad of part of the earnings by the exporters. It is worth noting that in 1990-91 errors and omissions averaged \$0.8 bn for the USSR (Table 2), or barely one-fifth of Russia's \$4.2 bn in January-September 1992; most of the difference can only be attributed to capital flight.

One may now look at the size and trend in Russia's external debts. Grabisch et al (1992: 85) estimated the end-1991 Soviet debt at \$81.4 bn. The central bank chief, Gerashchenko also cited a figure of \$80 bn for 'old', presumably pre-1992, debts (*Argumenty i fakty* 1993/8). If my reading is correct, considering changes in 'payments overdue' as well as new loans, the incremental debt (in \$ bn) stood at 15.4 in 1990 and 11.4 in 1991. During the first nine months of 1992, payments overdue shot up to \$8.7 bn, and new loans amounted to \$8.9 bn; it is not clear how much of the new loan was assigned to other CIS members, or whether Russia will shoulder the responsibility to repay,

recovering somehow the dues from the latter. Overall, Russian debt at end-September 1992 ought to exceed \$95 bn. It would then appear that between end-1989 and end-September 1992, Russia's debt position worsened by about \$40 bn

II

The balance of payments data just presented tells only a part of the story. Since there is no adequate record of the flow of goods between Russia and the 'near abroad', vast quantities of Russian goods have been transhipped through these porous borders into hard currency areas just as a lot of imports (including the traditional items from India) entered Russia in this manner; these transactions do not find a place in Tables 2 and 4 above. Moreover, as the items, 'corrections to export' and 'errors and omissions', in Table 4 indicate, the recorded transactions often involved a breach of the rules; it is a matter of guess whether these adjustments were adequate. Some additional information merit attention.

(1) Late in 1992 a Russian official report showed concern about the 'uncontrolled supply' from Russia, of light non-ferrous metals, wood, petrol, etc. through smuggling valued at several billion dollars. Then there was gross undervaluation in export of ferrous metals by 50 per cent; for caviar the authorities were aware of the ruling world price per kg of \$120-200, but allowed export at a throw-away price of \$35 [Anon 1992].

(2) According to two MOFER officials [Sarfanov and Lirov 1992], the export prices declared were often 5-10 times below the international prices, while those for imports were jacked up by 10-15 per cent. Crude oil was at times exported at a ridiculously low \$3-5/ton. Moreover, documents were faked to claim exports earnings of \$1.5-2.0 bn.

(3) There are just a couple of dozen state officials to monitor exports, who 'could not avert the avalanche-like export

TABLE 3. RUSSIA'S FOREIGN TRADE, 1990 AND 1991

a See Table 2.

Note: Russia's shares in the Soviet totals were assumed to be: in exports 78 per cent in both years, in import 68 per cent in 1990 and 67 per cent in 1991, and in gold production 67 per cent in both years.

Source: *Foreign Trade*, 1992/2, p 41

of strategic materials, mainly non-ferrous metals and rare-earth elements via the "near abroad" to the West and the East. There was no specific law to bar it. The customs officials were at a loss. Punishment was symbolic, and not a deterrent [Orlov 1993].

(4) The Russian customs officials are quite malleable. A nightclub owner in Moscow had a consignment of imported alcohol classified as 'humanitarian aid' (Newsweek, February 15, 1993).

(5) According to western sources cited by Skirbinskaya (1993), the CIS countries issued licences for the export of a 7,35,000 tons of aluminium in 1992. Another 1,50,000 tons were shipped out by joint ventures, and illegal export was as high as 4,00,000 tons; according to another businessman, the West obtained 6,00,000 tons against funds supplied to extract the raw materials.

(6) The outflow of non-ferrous metals through Estonia has assumed such gigantic proportions that the country (lacking any of these resources) suddenly emerged as the world's 6th largest exporter in that product group. Out of some 60,000 Russian soldiers stationed in the Baltic states, many had set up private companies to siphon off to foreign countries vast quantities of metals stolen from the military bases (Newsweek, October 5, 1992; Economist, December 7, 1992).

(7) In an interview with the *Nezavisimaya gazeta* (April 10, 1993), the Russian minister of security, V P Barannikov, informed that official investigations showed illegal exports of 2 mn tons of oil, and tens of thousand tons of metals. There were about 300 criminal deals. In a special operation the authorities cancelled on a massive scale licences to export minerals, strategic raw materials and defence technologies; they also prevented visits abroad of innumerable scientists who had an access to (defence-related) secrets.

(8) In a bid to tighten control over the export of critical raw materials, the number of authorised exporters was recently slashed from 2,500 to 186, excluding the joint ventures (FBN, March 19, 1993).

The illegal or semi-legal exports obviously led in the first instance to capital flight from Russia. Under the existing rules, capital flight could and did take place in a perfectly legal manner as well. In general, exporters were required to surrender no more than 50 per cent of their export earnings to Russian authorities, keeping the rest for their own use, usually in foreign banks, for any length of time. It is, however, doubtful that the latter necessarily led to capital flight; for, a good part should have come back in the form

of import, legal, semi-legal or illegal, to reap higher profits from the sale of such goods in the Russian market; the same should hold for illegal export earnings. It seems to me that in the Russian context, the term, 'capital flight', refers to any foreign exchange earnings not repatriated back into the country through the official channel.

Given the inherent difficulties in measuring capital flight, I list below the alternative estimates. The last one is given by some western sceptics of the proposed G-7 aid to Russia, who "fear that the money will go down the drain; there are also reports that large sums of money, more than double the size of the G-7 aid package, have been flown to bank accounts in Switzerland and elsewhere from the 'broad grey areas of capitalism and economic crime in Russia'" (*The Statesman*, April 18, 1993). It still seems to me rather implausibly high, considering the earlier volume of Soviet trade, and the disruption in the Russian economy since 1991. My feeling is that though capital flight was far higher than before in 1992 when the policy regime was drastically altered opening the flood gates, the stock in early 1993 was no more than \$25 bn (Table A).

III

Illegal external transactions on the scale just described could not take place without a serious deterioration in the law and order situation. Mafias emerged across the length and breadth of the ex-USSR, corruption spread like an epidemic among civil servants and politicians at various levels, and government decisions were frequently changed or kept in abeyance to propitiate particular interest groups. Some evidence on each of these aspects are given below.

(1) Actually, the mafias came to the limelight in the wake of the perestroika which was dubbed in common parlance as 'the golden age of the mafias' [Anon 1991].

(2) Official statistics on violence are quite disturbing. In the global surveys of the World Health Organisation the USSR used to occupy a lowly place in the table on the number of deaths due to shocks, poisoning and violence in different countries; by now Russia is right at the top. There was a big spurt in criminal activities during 1992 when as many as 23,000 premeditated murders took place (*Izvestiya*, April 7, 1993).

(3) *The Newsweek* (October 5, 1992) had a long write-up on 'The New Chicago on the Neva', referring in particular to St Petersburg. Quoting a Russian ministry of the interior source, it said that there are

3,000 gangs extorting millions of dollars operating rackets like prostitution, drug and arms trade, and exporting billions of dollars of raw materials. Marijuana bought for a pittance in Uzbekistan, and finds its way through Russia and Estonia to Finland. A single gang takes 40 tons of copper every week to Estonia. One Polish businessman in Vilnius, Lithuania bought 10,000 tons of copper. A Russian firm bribed a Lithuania-based Russian Army officer to export aluminium irrigation pipes with a total length of 49,000 km. Bronze, zinc and titanium are among the non-ferrous metals exported in large quantities.

(4) How the rule of mafias is spreading into ever newer areas was narrated by unnamed Indian exporters to Russia. Soon after landing in Moscow, they were contacted by the former and asked under threat to conclude deals only with themselves, bypassing the traditional agencies. Although no Indian exporter has so far been physically harmed, other foreign traders were actually beaten up, even killed. Complaints with the authorities proved infructuous. Comprising of former employees of the KGB, as well as low-level ex-CPSU officials, the mafias are reportedly financed by higher level officials; they run the whole network, including the agent, importer, wholesaler and retailer. Independently of the Moscow mafias, similar gangs operate in different parts of Russia. The story was confirmed by diplomats in Delhi. As a result, the hard pressed among the Indian exporters succumbed to the dictates of the mafias, accepting a lower profit margin; the more resourceful ones took a circuitous and costly route, selling through front companies in Singapore etc. on a consignment basis to the established importers [Satish and Dinakar 1993]. If this reduces the volume of India's exports, it also diminishes Russia's export to India. After all, mafia rule thrives best in an economy of penury.

Mafias cannot flourish without political support at various levels up to the very top. Nothing illustrates it more vividly than the current upheaval in Italy with over 2,500 persons, including former prime ministers, top civil servants and officials in the public sector, and business magnates in the private sector, already implicated in court cases. How many of them will survive the debacle remains to be seen. The reported kickbacks run into several billion dollars.

After the Soviet glasnost, revelations about rampant corruption in high places during the Brezhnev era, even involving the family of the leader, were one major, but not the only, factor behind popular

evulsion against the Communist Party and the whole system. Confounding the naïve expectation of many, including myself, that politicians would henceforth be chastened, in the late 1980s corruption increased by leaps and bounds with every passing day. In the present atmosphere the image of politicians in this respect is badly tarnished, while charges and counter-charges are levelled against individuals for narrow political gains without sufficient proof. But there is no denying the fact that a large number of politicians are wallowing in luxury beyond the dream of the Brezhnev coterie. Gavril Popov, a former mayor of Moscow and a liberal economist of repute, is reported to be among the five richest in Russia. Vice-president A Rutskoi, who sides with parliament against Yeltsin, recently accused the president's team of selling state property at knock-down prices to western firms and Russian mafias; he claimed to have seen evidence as chairman of the Anti-Corruption Commission, and singled out ex-premier E Gaidar and G Burbulis among others. Barely a week after Rutskoi's allegation, the office of the Russian Prosecutor General issued a statement on 'illegal deals' to sell Soviet army property in erstwhile East Germany, implicating the present defence minister, General P Orachev, and G Burbulis, formerly the first deputy prime minister and a long-time confidant of Yeltsin (*The Economic Times*, April 18 and 24, 1993).

Shortly before the referendum Rutskoi made three startling allegations, all of which were challenged in separate articles in the *Izvestiya* (April 20, 1993). (1) Out of the so-called humanitarian aid (see item 4 in Table 2 and item 6 in Table 4), Rutskoi asserted, 40 bn rb ended up in the pockets of mafias and their official patrons. His critics did not deny that a good part of the aid might have been misappropriated, but the total aid was far less than Rutskoi's figure. (2) The size of the 'shadow' economy was put at 3,000-3,500 bn rb. (3) It was also claimed that up to 40 per cent of Russia's GNP in 1992 was under the control of 'organised criminal gangs'. On the last two, his critics held that statistical work was in progress, but thought that the magnitude had been exaggerated by Rutskoi.

Thanks to the mafias and internal corruption, the government increasingly lost control over the economy since the late 1980s. On vacillations in decision-making caused by pressure groups, only a few specific instances will now be given. Some more will be provided later.

(a) In order to prevent large-scale misuse of duty exemption in respect of goods brought in from abroad by return-

ing citizens, new tariffs up to 20 times higher than the old ones were introduced in July 1991, but were suspended within barely 6 weeks (*Keesings Record of World Events* (KROWE) July-August 1991, p 38343).

(b) As part of the price-liberalisation move on January 2, 1992, new import tariffs at a much higher level were imposed on a wide range of commodities; but these were put in abeyance just two weeks later, pending revisions in April (KROWE, January 1992, p 38731).

(c) The government made a much-delayed announcement on the doubling of petrol prices in March 1993; yet in early April the president reversed it, apparently because the motorists were 'infuriated' and the referendum was round the corner (*Financial Times*, April 11, 1993).

IV

No one will dispute that the Russian economy is in a very bad shape. Who are responsible and in what way? In the western media, Yeltsin's opponents are dubbed 'hardliners', 'right-wing', 'anti democratic', 'communists' and 'nationa-

lists' who wish to return to the bad old days of an overcentralised command economy. What are their sins? A focal point of western attack is the central bank for recklessly printing notes and offering credits indiscriminately, thereby fuelling inflation and refusing any monetary reform; the chairman, it may be recalled, is designated, not by the president, but by parliament. Parliament is accused of: (i) imposing price controls over a large number of commodities, impeding the process of price reforms; (ii) indexing wages and salaries in the state sector, aggravating the inflationary spiral, and preventing a downward flexibility in real wages; and (iii) refusing to pass the bankruptcy law so that uneconomic state enterprises are kept in being artificially, adding to the budget deficit. Free prices, wage flexibility and bankruptcy law are among the *sine qua non* of economic reform to which Russia is committed and a necessary condition for western aid. The Russian parliament and the central bank are effectively sabotaging the programme, and prolonging the agony of the nation with the ulterior motive of fomenting hatred among the people against Yeltsin

TABLE 4 RUSSIA'S BALANCE OF PAYMENTS, JANUARY-SEPTEMBER 1992
(US \$ million)

	Credit	Debit	Net
(A) Current account:			
(1) Merchandise trade: total	27,600	25,700	1,900
HC	19,500	20,500	-1,000
Barter/clearing	8,100	5,200	2,900
(2a) Correction for export-I	..	2,900	-2,900
(2b) Correction for export-II	..	1,215	-1,215
(3) Gold shipment, including 'swap'	1,742	..	1,742
(4) Services	2,900	3,254	-354
(5) Investment income	3,209	2,679	530
(6) Humanitarian aid and import	1,600	1,600	..
(7) Current account total	37,051	37,348	-297
(B) Capital account:			
(8) Credits drawn (utilised/amortised):			
(a) by state	535	308	227
(b) by others	8,900	7,442	1,458
(9) Credits assigned (utilised/amortised):			
(a) by state	8,747	328	8,419
(b) by others	..	1,080	-1,080
(10) Direct investment	1,100	1,325	-225
(11) Portfolio investment	293	..	293
(12) Unpaid interest on loans	2,113	2,719	-606
(13) Unpaid amortisation on loan	3,244	7,860	-4,616
(14) Rescheduled amortisation on loan	3,233	75	3,158
(15) Errors and omissions	..	4,158	-4,158
(16) Capital account total	29,702	29,525	177
(17) Central Bank foreign exchange reserves	437	317	120
(C) Aggregate balance of payment	67,190	67,190	Nil

Notes : (1) Data exclude Russia's transaction with the 'near abroad', i.e. other ex-Soviet republics.
 (2) Values of trade are higher in MOFER than in the Goskomstat data shown here.
 (3) Rows (2a) and (2b): See the text for explanation.
 (4) Rows (8) and (9) refer respectively to credits, prior to and during 1992.
 (5) Rows (12) and (13) refer to default by Russia against the scheduled debt services, only a part of which, as shown in row (14), was rescheduled by the creditors.
 Sources: Goskomstat et al (1993) and Sarafanov (1993); prepared jointly by Goskomstat, Central Bank and MOFER.

and his liberalism; if they succeed, the return of the communists will be just a matter of time.

The western media, despite its self-professed objectivity, is highly selective, if not tendentious, in its presentation. I shall highlight a couple of instances of double standards. (a) *The Economist* (January 30, 1993) admits that if the central bank had not expanded money supply, industrial production in 1992 would have fallen by much more than the actual rate of 22 per cent. (b) *The Economist* (January 23, 1993) accused the Supreme Soviet of having passed a law that raised pensions by 90 per cent, without consulting the finance minister; it passed over in silence by how much prices had increased since pensions were last fixed. A fortnight later (February 6, 1993), the same weekly pointed out that the enhanced monthly pension of 4,275 rb was some 16 per cent below the 'minimum subsistence level' that assumed 'a diet heavy on carbohydrates, little protein and no money left over for clothes'. (c) When Yeltsin, in view of the impending referendum, doubled the wages of state employees in early April 1993, there was no adverse comment (*Financial Times*, April 11, 1993). (d) *The Economist* (January 9, 1993) lamented the imposition of price control, despite the advice of liberals, by premier Chernomyrdin on bread, milk, meat and vodka; for, the state would have to foot a subsidy bill of 1,000 bn rb. But when Yeltsin succumbed to the demands of 'infuriated motorists' in early April 1993 (*Financial Times*, April 11, 1993), and reversed the decision taken in March to double oil prices, the western press was quiescent. Nor has the western press talked much about numerous tax concessions, etc, handed out to domestic and foreign entrepreneurs by the Yeltsin government, of which some examples will be given later.

One may now turn to some Russian debates on the economic crisis, beginning with Sarafanov (1993). The balance of payments described earlier, will pose enormous problems for the Russian ministry of finance in the years to come. Since 1992 there is a system of 'domestic accounting prices' (DAP) for goods imported through debt service payment from Russia's debtors (say, tea from India) as well as for goods exported by Russia (say, crude oil) to meet her own debt service obligation to Western creditors. The Russian federal budget obtains from the tea importer the value of the consignment at DAP, and reimburses, also at DAP, the domestic producers for the quantum of oil exported. The DAP per dollar of such import, it has been found, is three times lower than the DAP per dollar of export;

as a result there is an enormous drain on the budget.

The budgetary problems are compounded by certain existing policies. Though the ministry of finance has no foreign exchange reserves, it has to meet the 'state's needs' (*gosnuzhd*), i.e., servicing foreign loans, outlays on Russian embassies abroad, etc, and the 'centralised import' of food, medicines, technological raw materials, etc. The dollars are bought through the central bank at the prevailing auction rates of the Moscow Interbank Currency Exchange. Owing to social obligations, commodities acquired under 'centralised import' are sold by the government, according to a MOFER estimate, at a huge subsidy of 60-70 per cent on the import value. Assuming these imports at \$10 bn in 1993, then at the December 1992 market rate for the dollar, the total subsidy during 1993 would amount to 4,000 bn rb which is more than 25 per cent of the income (under 15,000 bn rb) projected in Russia's budget for 1993.

On top of it comes the debt servicing obligation; in Sarafanov's apt phrase, it is like a 'slow acting bomb' that will explode with much greater intensity sometime in the future. At the current (March 1993) exchange rate, the government in 1993 would have to earmark 16,000 bn rb to service old and new debts, which actually exceeds the whole of the budgetary income. Even if this last figure is reduced by one-quarter, Russia seems to have run into a cul-de-sac.

In a polemical article, Makarevich (1993) poured cold water on the assertion by none other than Yeltsin that by March 1993 the inflationary fire was about to be extinguished. After all, the 1993 budget in his calculation will have a deficit of 10,000 bn rb against an expected 1992 GNP of 15,000 bn rb. Similar figures were put forward earlier by Gerashchenko (*New Times International* (NTI) 1993/19); against a revealed deficit of 3,500 bn rb, the 1993 budget contained 'concealed' outlays of 6,000 bn rb, bringing the total deficit to 9,500 bn rb.

Returning to Sarafanov's argument, one way out would be to impose higher tariffs on export and import in order to finance the centralised import. But the government had granted innumerable tax exemptions to individual enterprises as well as regions; one estimate showed that only 400 bn rb were collected as export duties in 1992; it would have been as much as 2,500 bn rb in the absence of such incentives. Sarafanov's figures on the loss to the exchequer are supported by I Democh (*Izvestiya*, March 31, 1993). The amount in billions of ECU (European Currency

Unit of the Common Market, 1.0 ECU = \$1.2 in early April 1993) was 2.2 for export and 0.3 for import in 1992; in the first 2-3 months of 1993 the losses had already reached 0.7 and 0.3 respectively. While the presidential decree has abolished the earlier tax exemptions for enterprises and regions, it leaves untouched the new privileges granted in 1993 by the president (exempting oil and gas industry from compulsory sale of a part of their dollar earnings to the state) as well as the parliament.

Sarafanov posed two alternatives. The first one is to strengthen the existing tariff system to regulate foreign trade, promote internal convertibility of the rouble (presumably, by bringing domestic price ratios closer to the international ratios) and remove gradually all quantitative restrictions on foreign trade. At the same time, an effective exchange control has to be put in place. The budgetary burden on account of centralised imports could be eased by drastically curtailing the volume of such imports. Further, the government has to stimulate hard currency export and the inflow of foreign direct and portfolio investments.

The second alternative, Sarafanov continued, is to abandon the present method of managing the economy primarily through 'economic' or price-cum-tax measures. Quantitative restrictions on foreign trade has to be applied more extensively. For centralised import, a more favourable official exchange rate may be needed. For debt-servicing, the state should fall back upon traditional administrative methods, and the finance ministry should work out a plan for dollar earnings and receipts. As a last resort, one cannot rule out a return to the earlier state monopoly on foreign exchange and foreign trade, depending on the evolving political situation in Russia. This second alternative may become a reality in the not-too-distant future, Sarafanov felt.

The weekly *Ekonomika i zhizn'* (1993/10: pp 2, 3) had an interesting panel discussion in March on the theme, 'What is the way out of the crisis?'. Fedorov, the finance minister, stated that the country had 'whirled on' (*dvinul'sya*) to the market; while the command economy had been dismantled, no 'civilised' market economy was yet in place, and the government is so weak that it is unable to formulate an economic policy. This can be changed by adopting strict priorities in agriculture and industry, and implementing them in such a manner that maximum results are obtained from every rouble spent by the government in each sector. The state should regulate, and not administer the economy. L. Abalkin, a

leading economist who was advisor to Gorbachev, agreed on many points; if production is to receive priority, the targets must be carefully selected, and the state enterprises in those areas have to be stimulated. This would mean a complete reversal of the policies pursued since mid-1991. (Presumably, he referred above all to the lifting of price control on January 2, 1992, leading to a 3.5-fold jump in consumer prices during the month, and a 26-fold rise during the year.) Gerashchenko, the central bank chief, thought that a major mistake of the government in 1992 was in allowing a complete loss of control over the economy; indeed, it liquidated those very structures that could exercise some control over the economy. It is difficult to explain to ordinary citizens why in spite of a cutback in defence production, living standards are continuously going down. The government may criticise the central bank because there is too much money or that the credit policy is lax, but it has failed to spell out the economic goals for the current year that would provide a framework for monetary and credit policies.

In an interview with *Nezavisimaya gazeta* (April 6) A. Nechaev, till recently minister of the economy under Yeltsin and now heading the Russian Financial Corporation, admitted that he had been bamboozled in his ministerial work by powerful industrial and regional lobbies clamouring for various tax privileges; within the government sectional interests led with each other to obtain more funds for themselves.

Perhaps the most telling refutation of the thesis that the parliament-controlled central bank has been at the root of the hyperinflation, comes from a report in the pro-Yeltsin, *Izvestiya* (April 13, 1993), entitled: 'V. Gerashchenko and B. Fedorov agreed: The Main Source of Inflation—Government'. The two are respectively the *rite noire* and the 'darling' of the western media. The volte-face by Fedorov during hearings in parliament was quite unexpected. Under attack from Gerashchenko, the former admitted that: there are lobbyists from different industrial sectors who would not allow inflation to be slowed down; as much as 40 per cent of tax dues remain to be collected; and the central banks in the 'rouble zone' outside Russia do not co-ordinate their activities with their Russian counterpart, leaving huge quantities of rouble outside the control of the Russian central bank or government. I should add, though Fedorov did not say so, that Yeltsin has been encouraging 'waywardness' among the CIS partners sans Ukraine. Both Gerashchenko and Fedorov agreed that inflation can be

controlled. Ironically, the same Fedorov had just a few weeks earlier categorically rejected the central bank's proposal on monetary and credit reform, characterising it as 'unprincipled' and 'unprofessional' (*Izvestiya*, March 23, 1993).

Yet the former premier Gaidar (1993) remains an unrepentant monetarist. He thinks that various interest groups have a stake in the inflation. Financial operations now run into millions, not of roubles, but of dollars. Thanks to cheap credit, apparently to meet the working capital needs of productive enterprises, the bank loans are quickly changed into dollars, provoking further devaluation of the rouble. Gaidar rejects the idea that inflation will cool down once production picks up. On the contrary, the first task is to ensure financial stability, and simultaneously define clearly the ownership of enterprises. Production can go up only when entrepreneurs put money into it, and not before. Gaidar also felt that the entrepreneurs are now overtaxed, paying for the huge unproductive expenditure of the state. He picked out specifically the 'rural' subsidies, accounting for as much as 10 per cent of the GNP in Russia against 0.2 per cent in the US; a good part of these subsidies in fact went into financial centres and commercial units, negating the very objectives of the subsidy scheme.

V

The situation regarding the oil industry is of particular interest for a variety of reasons. First, production has fallen steeply; the expected output in 1993 is 340 against 518 mn tons in 1990. Though production has been declining, it has not so far affected export to the same extent. While the USSR as a whole exported 109 mn tons of crude oil in 1990, Russia alone shipped out 61 mn tons in 1992 and as much as 11 mn tons in the single month of January 1993 [Goskomstat 1991: 281; *Nezavisimaya gazeta*, April 6, 1993]. Thirdly, although the sector has been a major hard currency earner, there has been an acute shortfall in investment. To keep the production going, up to 90 per cent of the existing equipment had to be modernised, without necessarily scrapping them altogether. But where are the funds? Should Russia go for foreign capital? Should Russian domestic prices remain as low (*vis-a-vis* world prices) as at present? Controversies have surfaced on these questions.

Foreign capital, as in Tsarist Russia, is keen to enter the scene in a big way. Only two recent examples will be cited in this context. First, the US Eximbank has entered into a \$5 bn Memorandum of

Understanding (MOU) with the Russian government for supplying oil equipment against oil supplies; already, it has decided to support equipment sale worth \$500 mn in return for oil valued at \$2 bn. The sale proceeds under the MOU will be deposited in offshore escrow accounts until the debt is repaid (FBN, March 19, 1993; *The Economic Times*, April 18, 1993).

The second example is from Kazakhstan (*Nezavisimaya gazeta*, April 10, 1993). Located at Tengiz in the oblast of Atyrauz, the joint venture, Tengizchevroil, is a 50:50 partnership between the Kazakh state and the US oil giant, Chevron. Out of a proven stock of 25 bn barrels, only 6-9 bn barrels can be extracted; production started in 1992 with 65,000 barrels/day and will rise to a maximum of 700,000 in the year 2010. Under the agreement, Chevron's nominee is the director-general, while the oblast chief is the other director. Chevron has already spent \$50 mn on social infrastructure at Alma Ata, the far-away republican capital, and will pay a similar sum in the next 5 years to the oblast authorities. The joint venture will invest \$2.0 bn on the oil project, but the exact contribution from each partner is not mentioned; 50 per cent of the income will accrue to Kazakhstan, in addition to taxes and royalties, while Chevron will have 20 per cent of the income over the 40 years of the venture. When the Moscow newspaper asked why the contract did not leave any room for ecological specialists, the oblast authorities kept silent; why the latter reversed their earlier decision to oppose the scheme, also remained unanswered.

Strangely enough, the US Eximbank's MOU had been stalled for sometime by none other than the World Bank. As a 'global' agency it had been insisting on having, in legal parlance, the 'first mortgage' on the assets of a debtor country; in case of a delay in payment by a debtor country on debt service, the bank used to have priority for its own credits over that of any other creditor, public or private. In March or April the World Bank resiled from this position, and allowed the US Eximbank as well as Japan to provide credits to Russia under the special escrow arrangement, as demanded by the US government (I. Panasenkov in *Moscow News*, April 16, 1993). The Russian government was equally obliging. President Yeltsin issued a decree on March 19 exempting joint ventures in oil and gas industry from the obligation to surrender the usual 50 per cent of hard currency earnings to the government; it is estimated that the decree would affect about 20 mn tons of oil export. Earlier, the government had removed the export duties on oil sent abroad, and also tariffs on imported

equipment and critical materials. The oil industry's demand for subsidy was, however, turned down (V Kremer, *Moscow News*, April 16, 1993). The earlier decisions (prior to March 19) have been extremely beneficial to the Russian 'producers' associations' which are responsible for the bulk of current export of oil (*The Economic Times*, April 18, 1993).

The domestic pricing of oil is the subject of a major controversy. Neverov and Igolski (1993) called for a rejection of the World Bank's advice to the government that the domestic price of oil be raised to the international level, and that Russian oil be sold abroad through global tenders. The authors believe that such a move will reduce domestic consumption to the detriment of the poor, cause a glut in the world oil market, and put a downward pressure on world oil prices, since Russia is a major supplier; they also pointed out that the international price per barrel of oil had been falling from \$28 in 1985 to \$21.5 in 1991. The authors favoured a cutback in production and export.

I am not sure that the Neverov-Igolski proposition on the domestic price of oil is quite sound. Some gap between domestic and foreign price for a renewable resource can easily be justified. Thus in the 80s when the international market for tea became bullish, the Indian government pegged the annual export volume at 200 mn kg; as a result, domestic consumers had cheaper tea, the international price shot up, and India's (also others') export earnings increased. For a non-renewable resource like oil the same argument does not apply; for, the annual supply is not fixed as with an agricultural commodity. Barring special cases of hardship, it may be better to keep the stock of black gold underground, rather than allow it to be frittered away at a low price by the affluent domestic consumers.

Prices of oil and many other scarce raw materials were deliberately kept low from the days of the Soviet First Five-Year Plan. In this respect the situation today is not different. Even after the price liberalisation of January 1992, the Russian domestic price of oil per ton was only 350 rb [Grebsch et al 1992: 84], or \$3.50 at the prevailing auction rate. In March producers were selling oil to the government at 6,500 rb or \$10/ton, and the retail price in the Central Region ranged from 35-40 rb or \$0.06/litre (*Financial and Business News* (FBN), March 19, 1993; *Moskovskie novosti*, *Business*, March 14, 1993). The consumer price of petrol in Russia is absurdly low at barely 10 per cent of the West Europe rate (*The Economist*,

January 23, 1993; *Newsweek*, February 15, 1993).

The state now garners for the budget the difference between its purchase price and the retail price (less costs). In my view, a significant increase (in real terms) in the oil price could raise the state's income by a huge sum, and facilitate the setting up of a special fund to subsidise consumption by the vulnerable sections, and encourage investment by the domestic producers, using equipment from the under-utilised machinery sector. It does not seem, however, that either the west or the various lobbies in Russia or even the populist forces there would welcome such a move.

Returning to the basic proposition of Neverov and Igolski that Russia, far from maximising, ought to cut back the export of oil, is also echoed by many others. 'There is much talk nowadays', wrote the parliamentarian, Y Ivanilov (FBN, March 19, 1993), "that the West, primarily the IMF, wants to make Russia simply a source of raw materials". Ivanilov did not want to attribute any such motive to the IMF or the west; he still felt that Russia should concentrate on export of high technology products rather than raw materials.

After the US Eximbank's MOU, the Tengizchevroil venture, and the major policy reversal by the World Bank, it is difficult to escape the conclusion that there is, indeed, a grand design to extract maximum oil from Russia for the western market. The fact that in the joint ventures, western equipment as well as key materials will enter Russia free of tariffs, is likely to sound the deathknell for Russian equipment manufacturers. Practically every decision of the Yeltsin government on the oil sector has helped western penetration into Russia. In fairness it must

be added that the policy of pushing to the utmost export of oil was inaugurated by Brezhnev and continued by Gorbachev.

BCC FUBA INDIA LIMITED

Regd Office- 4 Km. Swarghat Road, Nalagarh-174101
 Distt. Solan (H.P.)

Notice is hereby given that a Meeting of Board of Directors of the Company is fixed for Friday, the 28th May, 1993 to consider among other things to take on record the unaudited half yearly financial results (Provisional) of six months ended 31st March, 1993 of the Company

Date 10th May, 1993

for BCC FUBA INDIA LIMITED
 Sd/-
 C B Gupta
 Company Secretary

Industrial Negligence and Right to Know

K Ravi Srinivas

YOUR editorial on Industrial Negligence (March 20-27) is timely and has raised many important questions. The very fact that even after almost a decade since Bhopal Gas tragedy there is no regulatory mechanism to prevent such events nor to effectively cope with unforeseen accidents indicates the failure of the state in controlling pollution and safeguarding the health of the people living near the plant. On the one hand the economy is being liberalised and foreign investment wooed, on the other till date there has been no law to provide information to the workers or to the nearby community about the potential hazards and what steps should be taken in the event of an accident. By welcoming foreign investment in almost all sectors the government has opened the doors for multinationals and other foreign investors to produce in India goods which they could not produce in their countries due to prohibitively expensive environmental regulations and public outcry. The government has neither adequately strengthened the existing regulatory mechanism nor has provided the right of information to people. What is still worse is that there seems to be no initiative on the part of the government on passing a law that would make the TNCs disclose risk information on activities involving the operation of a facility that could endanger public health, safety and environment, or on the production, sale and export of goods that could harm people and environment.

This problem is not unique to India, as more and more developing nations compete with each other in attracting foreign direct investment, import of new technologies and production processes, provision of various facilities for setting up units, particularly in export processing zones. But they cannot afford to overlook safety and public health aspects of such investments. Can they effectively regulate the conduct of TNCs for safeguarding environment and public health? Some interesting answers and suggestions to such questions are found in a report prepared by Michael Baram, director of the Centre for Law and Technology, Boston University Law School for UN Centre on Transnational Corporations,* where he discusses the regulatory schemes and disclosure mechanisms in vogue in industrialised nations and makes proposals for application of these regulations and other mechanisms for developing nations.

In the US a developer has to apply to more than one agency at the federal as well as at the state level. Environmental Impact Statements (EIS) which will be available for public are to be submitted

and an unique feature of EIS is that it must contain a review of reasonable alternatives and should be supported by professional analyses and other relevant evidence. This process based on EIS is a costly and time-consuming affair while its merits are that public have the right to intervene and the decision to implement could be challenged in a court. The 1985 Directive of European Community permits the states to integrate Environmental Impact Assessment (EIA) Analysis with the existing procedures. This has resulted in a wide range of regulatory mechanisms prevalent in various countries and the issue of how flexible and formal the whole EIA exercise should be, is yet to be resolved. Unlike the US where disclosure is a must under the principle of 'right to know', in Europe it is restricted to 'public concerned' under the principle 'need to know' and this limits the scope for public intervention. The OECD also issued guidelines on EIA while the UN endorsed the principle of EIA in 1982. Funding agencies like the World Bank and business organisations have also adopted guidelines on EIA.

In the US the federal enactment of Emergency Planning and Community Right-To-Know (EPCRA) in 1986 provides for risk communication and emergency planning mechanisms which include local emergency planning committees. Each firm has to submit information on materials handled, emissions, etc, and public access to reports submitted under EPCRA is guaranteed, subject to certain exceptions. But under EPCRA neither the agencies nor corporate officials are compelled to undertake review of facility safety while under the Seveso Directive of the European Community such a review is compulsory. Despite such drawbacks EPCRA has resulted in the increase of public pressure on facility owners and agencies of governments. The Major Accident Hazard of Industrial Activities Directive of the European Community (popularly known as the Seveso Directive) permits member-states to adopt stricter regulations than the ones in the directive. The competent authorities in member-states are permitted to inspect and impose safety controls subject to the national law. The directive also lays emphasis on risk communication. The directive has evoked mixed response and its implementation is not uniform in all the states. The OECD enacted two binding decisions regarding internal policies for information disclosure, public participation and exchange of information between member-states. World Bank guidelines are based on the Seveso Directive. The OECD has also issued

guidelines on aid programmes and hazardous installations in developing nations.

The Hazard Communication Standard (HCS) ensured that workers would receive information about hazardous attributes and risk consequences of substances used in the facility. The HCS has been effective to a great extent and it is flexible enough for adoption for a wide variety of facilities although it is far from perfect. In Europe there are many mechanisms like joint committees, worker-management committees, voluntary provision of information, etc, apart from various resolutions and declarations. The ILO has adopted the Occupational Health Service Convention in 1985 and has established the International Occupational Safety and Health Hazard Alert System. Various unions and organisations have stressed the importance of providing information to workers in a language understood by them.

The Freedom of Information Act enacted in 1966 facilitates public access to information and has been useful to environmental groups. In Europe some countries have passed similar laws. Both UNCTC and ILO have framed policy guidelines and Code of Conduct for Transnational Corporations and Code of Practices. Other organisations like the United Nations Commission on Human Rights have also expressed their concern about TNC behaviour in the third world.

Baram has also provided a set of guidelines for developing nations for implementation. If these guidelines were implemented in letter and spirit it would still be possible to avert Bhopals and the death of people due to industrial negligence. Moreover much information can be obtained by government from international and national agencies on dealing with industrial hazards and pollution. Such information should not become the monopoly of technocrats or bureaucrats, but should be made available to unions and workers. In their own interest, trade unions and workers should press for information on matters pertaining to work process, hazardous nature of chemicals that are being used and the impact of the process and products on workers' health. Only if the rights of workers and communities are recognised and upheld can such events be avoided. The mere appointment of more committees and pronouncements has become a meaningless exercise.

Do you plan to invest more than Rs 21 lakhs?

IDBI CERTIFICATES OF DEPOSIT THE WISEST INVESTMENT OPTION FOR YOUR SURPLUS FUNDS

**Tower of
Strength**

IDBI-THE TOWER OF STRENGTH

Industrial Development Bank of India (IDBI) is India's premier development financial institution engaged in promoting the country's industrial and economic progress. Year after year IDBI's financial performance has been excellent. And with an asset base of over Rs 28 000 crores IDBI's financial strength can only be envied. **THE IDBI CERTIFICATE OF DEPOSIT**—a unique investment opportunity combining high yield, safety

and liquidity. The IDBI Certificate of Deposit or CD is a bond in the form of a promissory note issued at a discount on its face value. The amount of discount is dependent on the rate of yield determined by IDBI based on market conditions and other relevant factors at the time of issue. The minimum amount of investment in CDs is Rs 25 lakhs (face value) and in multiples of Rs 5 lakhs thereafter. There is no upper limit. As CDs are offered at a discount on the face value, an investor will get an amount equal to the face value of CDs held by him on the date of maturity. **WHO CAN INVEST IN IDBI CDS?** Anyone—individuals, companies, banks, public trusts, funds or associations can invest in IDBI CDs. The governments of Gujarat, Maharashtra and Rajasthan have declared IDBI CDs as public securities for investment by public trusts located in these states. In some other states, such a declaration is not required. **MINIMUM PERIOD OF INVESTMENT** The minimum period of investment is 367 days, the maximum being 3 years. However, IDBI CDs are totally liquid. They are freely transferable by endorsement and delivery after 45 days of issue. **OTHER FEATURES** • Non-resident Indians can subscribe to IDBI CDs but only on a non-repatriable basis. Such CDs cannot be endorsed to another NRI in the secondary market. • **NO TAX DEDUCTION AT SOURCE** as income is in the form of a front-end discount. • IDBI CDs, backed by IDBI's financial strength, are totally safe. Your investment is risk-free. • IDBI CDs offer higher yield than conventional investments like fixed deposits, yet they are totally liquid. • IDBI CDs are available throughout the country at all regional and branch offices of IDBI. IDBI CDs are the most profitable way to invest your short-term funds. Besides higher safety, you are assured of high returns and liquidity. Contact us today at any of the addresses given here.

Patents and Pharmaceuticals

India is quite competitive in the pharmaceutical sector and there is no need to fear introduction of product patents. Considering imports as amounting to working of patents cannot, however, be accepted. Duration of patents can be left to mutual bargaining and pipeline protection can be used as a bait for cancelling or reducing pipeline protection of developed countries in areas like textiles. While unilateral action by the US must be resisted when multilateral negotiations are making headway, joining the Paris convention is not an important issue from the point of view of the pharmaceutical sector. Greater emphasis on R and D and substituting non-patented drugs for patented drugs are far more important.

1037

People against Arrack

Beginning in August 1992 in a remote village in Nellore district, the agitation by women protesting against arrack auctions and demanding ban on the sale of arrack spread to almost all districts of Andhra Pradesh. The movement has not merely raised the women's question as is being portrayed by the press and a section of the intelligentsia, but has targeted its attack on the nexus between politicians, police and arrack contractors.

1059

Double-talk

Does the government want to approach the IMF for a loan under the EFF? While within the country the finance minister has sought to give the impression that the 'success' of the economic reform programme has rendered such a loan redundant, the message he conveyed to the IMF during his recent visit to Washington was quite different.

1015

Army Rule

The decision to impose army rule in Kashmir, in effect if not formally, represents a tragic turn of policy, as much for India as for the people of Kashmir.

1017

Disaster Warning

Panchayati raj institutions are not only a virtually foolproof source of early warnings about potential calamities, but also an effective means of ensuring that such warnings do not go unheeded.

1019

The Megasytem

The megasytem, growing bit by bit as we fed it, has finally emerged from its quiescent gestation and woken to its own individual life. People and events can now more 'productively' be viewed as statistical possibilities, and as outcomes of forces interacting within a living system.

1030

Dowry in Orissa

It is not generally realised how violent Oriya society is vis-a-vis women. The state occupies the top position in the number of dowry deaths every year.

1020

Identity Crisis

The Bengalis are expending so much of time on such trivial issues as the Bengali calendar entering a new century or West Bengal being given a new name because of a gradual ebbing away of their *elan vital*.

1013

Biotechnology

Much of the critique of biotechnology deals not with technology as such but with its abuse by multinationals. This raises further questions about whether states are all that benign in contrast to private corporations or whether destructive/immoral technologies become less destructive and immoral in the hands of the state.

1033

Mitterrandist Tragedy

There are many interrelated facets that have gone into the disintegration of the Socialist Party in France, but the chief catalyst has been soaring unemployment.

1023

Distorted Criticism

THE government of India's (GOI) final withdrawal from the World Bank (WB) is a logical culmination of a process which began when Morse-Berger Inquiry was instituted in mid-1991 at the behest of the executive directors (EDs) of northern Europe and America. This was a result of highly distorted and misinformed criticism of the SSP unleashed by some environmentalists in the North and the Narmada Bachao Andolan (NBA). The government of Gujarat did little to counter these propaganda blasts. The Morse-Berger Report itself is full of factual and logical errors, methodological flaws, significant ambiguities and distortions and suppression of vital facts. The R and R environment situation as depicted by Morse-Berger is grossly fallacious. Unfortunately, the northern EDs uncritically accepted the major portions of the Morse-Berger Report. The EDs, for instance, accepted that the bank had, from the very beginning, not even appraised the resettlement component of the project—in violation of bank's own policy on R and R. They also accepted a serious charge that the bank staff was guilty of 'gross delinquency'. The reality was exactly opposite. Acceptance of such charges and many others set the stage for eventual withdrawal of the GOI. The distortions and humiliation the Morse-Berger report has heaped on the SSP were further compounded by the unfriendly remarks of the EDs who said among other things that they were ready to give benefit of doubt to India!

They have failed to see the central points of R and R. They have not understood and appreciated that it is the bank's continuous involvement and close monitoring of the R and R that has resulted in progressive improvements in the R and R policy and has strengthened the hands of those NGOs—oustees and those in the administration who wanted a fair R and R for the tribals. In lending their uncritical support to the Morse-Berger Report and through that to the motivated environmentalists in the north, they have unwittingly created clouds of uncertainty for the tribal oustees of Maharashtra and MP.

The SSP, at the most, can be delayed. It cannot be stopped. Morse-Berger were the NBA-environmentalists' best bet to mount a credible attack on the SSP. Morse-Berger have failed and so has the violent intellectual attack on the SSP. The vital question is: now that the bank is out,

the tribal oustees in Maharashtra and MP in increasing number are demanding a fair R and R, if the government of India fails to keep up its promise and to force the states to implement R and R in a fair manner, what will happen then?

ANIL PATEL

Arch-Vahini,
Mangrol.

Nominal Wages of Industrial Workers

AS the author of the book 'Wage Structure in Organised Industrial Sector', while thanking Bibhas Saha for his insightful observations in the book review (April 3, p 578), I have a few comments to offer.

After noting the main concern of the book, Saha suggests (para 2) that instead of being empirical, the study could have selected a model (or 'class of models') and studied and tested the predictions. Could one say that dissatisfaction with the existing literature need not automatically necessitate a 'theoretical motivation' behind this empirical study? Similarly while the study deals with the problem on the basis of the stated hypotheses, the results have been presented at the end of each chapter. Any further 'explanation' of the results (last para of the review) could only tax the reader, without any further illumination. It could also be said that in social science research it is not always clear what is "obvious and trivial" and what is substantial, unless a universal validity of received doctrines is assumed, as the reviewer seems to have done.

The results of the study have to be viewed against the background of the data constraints and the fact that 'models' can only be approximations and not replicas of the reality, particularly when they relate to issues of wage structure. The reviewer's comment, while dealing with econometric modelling, on the three dummy variables is not valid. Since three cross-sectional data of 1961, 1971 and 1981 have been pooled, the two dummy variables are required for allowing possible changes/shifts in the intercepts.

It is true that for validity of statistical tests for the significance of regression coefficients, the OLS estimates must be free from the problem of auto-correlation. The Durbin-Watson statistic showed significance of auto-correlation in only six cases. In a majority of the estimated regressions, the Durbin-Watson statistic shows that the auto-correlation is not significant. Thus, the statistical tests are valid. Needless to say, even if auto-correlation were present, the OLS estimates, though not efficient, would not be biased.

From an analysis of the data available for the study, labour productivity does not emerge as an explanatory variable for the behaviour of nominal wage, while inflation does emerge as the major causal factor. Though this finding may not fit in with the ideological predilections of every individual, the findings emerging from the analysis of the available data cannot just be disregarded.

The Victims

THE decision of the Bangladesh government to postpone a high-level official meeting with India—scheduled for the third week of May—to decide on the modalities for the repatriation of Chakma refugees has plunged the latter again into a state of uncertainty. About 56,000 Chakma tribals, who had fled Bangladesh over the last seven-year period to escape persecution by the security forces there, are lodged now in refugee camps in Tripura. Their fears have further been aggravated by the announcement made by the new Tripura chief minister that all foreign nationals who had entered his state from Bangladesh would be deported. New Delhi also, following assurances by Dhaka that "the Chakmas are welcome back", is keen on pushing them back into Bangladesh.

But till now there is no evidence of any guarantee from Dhaka that these Chakma families will get protection once they go back to their homes in the Chittagong Hill Tracts—which by all indications have been occupied by the Bengali plainspeople who continue to be settled there systematically under the covert and overt policies of Dhaka, whether under the Awami League leader Mujibur Rahman or his party's present rival, Begum Khaleda Zia. Amnesty International and human rights groups in Bangladesh have been regularly coming out with reports about atrocities committed on the tribal people by the Bangladesh security forces.

Apart from the Chakma families who had been coming to India following attacks by security forces, there are another 30,000-odd Chakma people who had settled in Arunachal Pradesh in 1964 after they were displaced by the Kaptai hydro-electric project in Chittagong built by the then East Pakistan government. But till today, they have not been granted Indian citizenship.

The dispute with Bangladesh over the Chakma issue is becoming a part of the wider problem of continuing influx from Bangladesh into the bordering states of India. Poverty and lack of employment are driving both Hindus and Muslims towards India where they either find odd jobs or fall into the clutches of unscrupulous agents who use India as a transit point for smuggling illegal immigrants into other countries. Some time ago, a group of Bangladeshi Muslims were intercepted in Delhi when they were found taking children to some Arab country to make them participate in the heinous practice of camel-racing.

Of late, there has been an increase in the number of Hindu immigrants from Bangladesh who are being driven not so much by poverty as religious persecution by the Islamic fundamentalists. The BJP has found this a convenient issue to whip up communal sentiments in the border states like West Bengal, Assam and Tripura, where most of the Bangladeshi refugees have found shelter. In the BJP vocabulary, while the Bangladeshi Muslim immigrants are 'infiltrators' who should be pushed back to Bangladesh, the

Bangladeshi Hindu immigrants are 'refugees' whose frustrations are being exploited by BJP politicians to turn them against the Muslims. While the BJP sheds tears over religious persecution of these Bangladeshi Hindus, they conveniently forget that the religious persecution by the Islamic fundamentalists there has been a direct consequence of the BJP-sponsored anti-Muslim riots in India. Whenever such riots take place in India, they provide a handle to the Islamic fundamentalists to retaliate against the Hindu minorities in Bangladesh. Such retaliatory actions followed the demolition of the Babri Masjid driving a large number of Hindus into India. It is the BJP and the Sangh parivar who should own up responsibility for the present plight of the Bangladeshi Hindu immigrants. But, by trying to force out Muslims from India (under the cover of flushing out Bangladeshi Muslim 'infiltrators') and settling Bangladeshi Hindu 'refugees' here, the BJP is moving towards its goal of 'religious cleansing' of the Indian state and turning it into a pure 'Hindurashtra'.

In order to avoid the repercussions that would inevitably follow such a development in the subcontinent, both Dhaka and New Delhi need to sit down and sort out the problem of influx before it assumes explosive dimensions. As for the Chakma influx, Dhaka clearly stands in the dock and will have to mend its ways to conform to the provisions of UN and other internationally recognised covenants which bind the Bangladesh government to protect the rights of the indigenous tribal population. Regarding the influx of the Bangladeshi Hindus, both Dhaka and New Delhi will have to share the responsibility. While it is India's duty to protect the lives and properties of the minorities from the onslaught of rising Hindu communal forces—which it has failed miserably to do—the Bangladesh government is expected to prevent the Islamic communal forces from retaliating against the Hindu citizens of Bangladesh, who cannot be held responsible for the anti-Muslim riots in India.

The drift in both Dhaka and New Delhi is however in a direction that is contrary to these requirements and expectations. In both the countries, the ruling powers are keen on appeasing the virulent fascist forces that are emerging from among the majority religious communities in their respective nations. In India, the self-proclaimed vandals of the Babri Masjid are being allowed by the state to flaunt the might of 'Hindutva'. Taking as it were a leaf out of its 'secular' neighbour's book, Bangladesh has decided to grant citizenship to the Islamic fundamentalist leader Golam Azad who collaborated with the Pakistan army during the 1971 civil war and masterminded the killing of Bangladeshis. Like the goons of the Sangh parivar who are parading their triumph in the streets of Indian cities, their counterparts in the Jamaat-e-Islami family of Bangladesh are holding demonstrations in Dhaka celebrating the rehabilitation of Golam Azad in politics.

THE ECONOMY

At the Cost of Growth

SHORN of the government's liberalisation shibboleths, the performance of the external sector in 1992-93 resembles that in some years of the 1970s. It reflects the depressed state of the economy as a whole. The government had resorted to draconian measures of demand management in 1973-74 as a result of which the rate of growth of industrial production, which had touched 5.8 per cent in 1972, slumped to 1.6 per cent in 1973 and 2.1 per cent in 1974. This in turn had contributed to a 12 per cent decline in the quantum index of imports in 1974-75. After a brief interregnum, demand compression measures had to be further stepped up in July 1974 and finally there followed the declaration of the emergency in mid-1975. The demand compression was reflected in drastic curtailment of development expenditure, the growth of which fell from 17.3 per cent in 1972-73 to 2.5 per cent in 1973-74. The growth of development expenditure by 39 per cent in 1974-75 and 21 per cent in 1975-76 in nominal terms has to be judged against the inflation rates of 20.2 per cent and 25.2 per cent in the previous two years, so that there was no increase in such expenditure in real terms. The depressed state-economic activity was reflected in the reduced level of imports. The quantum index of imports in 1976-77 at 97 (with base 1968-69 = 100) was lower than in each of the previous five years; in 1971-72, the index had been 105. As a result, the government was faced with an embarrassment of foreign exchange reserves. The level of reserves rose from \$782 million at the end of March 1975 to \$6,421 million at the end of March 1979. As the *Economic Survey* for 1976-77 put it, "currently our foreign exchange reserves stand at an all-time high level. It must however be emphasised that this result has been achieved partly at the cost of investment for growth". The *Survey* had further confided that "government policy is yet to find ways and means of utilising the external reserves for improving the growth performance of the economy".

The performance of foreign trade in 1992-93 reflects a parallel situation. With even more rigorous demand compression measures, including fiscal retrenchment and monetary and credit restrictions, there have come about severe recessionary conditions in industry which are in turn reflected in reduced import demand. Provisional data for 1992-93 just released show imports at \$21.7 billion compared to the exceptionally low level of \$19.4 billion in 1991-92. Even the *Economic Survey* for 1992-93, released in February, was expecting imports to be around \$25

billion. In 1990-91, imports had been \$24.1 billion. While commodity-wise details are not known, official expectations were that oil imports in 1992-93 would be at least \$6.5 billion, in which case non-oil imports would have shown a rise of 8 per cent at about \$15 billion compared to \$17 billion in 1990-91—an effective loss of about \$4 billion in non-oil imports, if normal import growth of about 12 per cent were assumed.

Against this background the euphoria in official quarters that the trade deficit in 1992-93, at \$3.3 billion, was well below the anticipated level of \$6 billion, misses the important point that it reflects the acutely depressed state of the economy. The same can be said of the seemingly impressive increase in foreign currency reserves in recent months. In the case of the reserves build-up, it has to be further noted, of course, that it is almost entirely based on borrowed funds.

SEX DETERMINATION BILL

Belling the Cat

THE Pre-Natal Diagnostic Techniques (Regulation and Prevention of Misuse) Bill was introduced in the Lok Sabha in 1991. The bill was modelled on the pioneering act passed in Maharashtra and in fact improved upon it. Subsequently, in an effort to involve different cross-sections of people in the discussion on the bill, it was referred to a joint committee of parliament. The committee took more than a year to arrive at a report after conducting hearings and inviting opinions from what was meant to be a wide cross-section of concerned people. It wrote to a large number of medical professionals and groups and some of the more vocal health activists asking them to send in their comments—75 copies in English and 25 copies in Hindi—within a period of 15 days keeping the input strictly confidential. It was only after much protest from activists that some concessions were granted. Even so the 'people' remained largely under-represented.

The committee has made some relevant changes in the bill: it has strengthened the role of the advisory committee and made its composition more representative; it has specified in what manner the woman should be informed about the risks and has introduced a disqualifying clause for membership to the advisory boards which is that those who have been associated with pre-natal sex determination procedures cannot be its members. However, it did not consider the registration of ultrasonography equipment, which is being used for sex determination especially in the north, as necessary, nor did it put an effective bar on pre-natal procedures

in the private sector despite a section of the committee holding strong views on the subject. It also retained the clause on making the woman punishable against the opinion held by many activists and women's groups, arguing that punishment of the pregnant woman will act as a deterrent and will go "a long way in achieving the cherished objectives of the bill".

Given the situation in Maharashtra two years after the act was passed, and the status of regulation in the medical sector, one wonders whether such a legislation will have any impact. In Maharashtra although the mandatory district committees are reported to have been set up, not one has met any activist groups who played a major role in the first stages of formulation of the bill have been increasingly marginalised. Moreover, most states are so lax in their monitoring and regulation of medical institutions that an act which specifically regulates a particular type of services is bound to be hard to implement even if there was the 'political will' to do so. For example, states like Tamil Nadu and Kerala do not have any legislation for monitoring nursing homes. It is a fact that the medical lobby is so influential in most states, and especially in those where health services are poorly developed and where unethical practices are rampant, that the act will necessarily remain unimplemented. While practices such as the misuse of medical technology need to be curtailed and monitored, this objective can be effectively pursued only within the purview of broader monitoring mechanism for the private medical sector.

EXIT POLICY

Why Not BIFR Route?

THE government has finally decided to come up with an 'exit' policy, that is, freedom for industrialists to close their units as they desire, without the permission of the government. Government spokesmen are still attempting to hide this truth. While inaugurating the 25th session and the national convention of the Indian National Trade Union Congress (INTUC), the prime minister sought to cover things up with heroic observations such as that the government did not want foreign investors "to use this country as a 'dharma-shala'... to come here only to make profit". He also assured his party's trade union fraternity that an 'exit' policy was not on the government's agenda. However, his own labour minister P A Sangma, had already revealed before the annual conference of the Confederation of Indian Industry (CII) a few days earlier that the proposed Industrial Relations Bill would do away with the existing provisions of the Industrial Disputes Act which made

government approval a mandatory requirement for closing down a unit. Defending the change, the minister had said: "We are the only country in the world to have such a provision. There is no reason why the government should decide on every application for closure". But in the same breath he too ruled out an exit policy. "The objective should be to discipline workers and not displace them", he said. All the same, the labour minister set out the government's objective in clear terms: "The government is committed to a new work culture on the part of labour, a new management culture and a wage regime linked to productivity".

The case for imposing some restraints on industrial closures is based on some special characteristics of industry and business in this country. First, the principal reason for sickness in industry has always been mismanagement. Second, as their personal stake in their companies has been limited, industrialists have sought to siphon off funds from older units to newer ones. Third, industrialists have on the whole plumped for short-term gains and gains from trading as distinguished from those from industry and manufacturing, in the process jeopardising the long-term interests of their units. Finally, industrialists who have sick units under them have invariably flourished elsewhere through other units with the help once again of funds from banks and public financial institutions. Broadly, the Indian situation could be characterised as one where private industrialists have obtained sizeable public funds from banks and financial institutions despite their own stake being minuscule, milked their units, diverted funds to other units, generally taken no long-term interest in the weak units and led them to a situation of sickness, leaving labour in the lurch. They have done all this with the connivance of public agencies and even government functionaries. In this situation what protection will the approximately one lakh workers employed in sick medium and large industrial units have if employers are permitted to close their units without government approval? What guarantee is there that the phenomenon of sickness would not derive further impetus from such a policy? Data compiled by the Board for Industrial and Financial Reconstruction (BIFR) suggest that of the accumulated losses of 1,018 companies at Rs 11,629 crore, the bulk was financed by non-payment of dues to financial institutions and the employers' statutory dues. Banks and financial institutions, along with their industrialists friends, are no doubt waiting for the law to be changed so that many more units can be revealed as being 'sick' (which of course will multiply further the number and amount

of non-performing loan accounts of banks). A simple measure to club different units under the same industrial group and adopt a group approach to lending by banks and financial institutions has not taken off the ground. If the government is interested in fair-play, it ought to enforce this simple solution, which is to desist from granting public funds to any unit of a group if there are sick units under its umbrella.

It is not as though under the present dispensation, there is no procedure for closure of non-viable units after considering the interests of all claimants: industrialists, banks and public financial institutions and workers. The BIFR set up in January 1987 to revive potentially sick industrial companies or recommend closure of non-viable units, has so far done a reasonable job. As the erstwhile chairman of BIFR has put on record, if the BIFR story is not a happier one, it is due to the dragging of feet by the Reserve Bank, by the banks and the term-financing institutions and by the government. The delays in the legal processes involved could be easily minimised and fool-proof institutional arrangements could be thought of for speedy decision-making in regard to sick units.

The BIFR story is by no means an entirely unsuccessful one so far. Up to the end of December 1992, the BIFR had received 1,772 references of which 440 were rejected on scrutiny. Of the 1,294 references registered, 234 cases were dismissed as not maintainable, 394 cases were approved for revival and 191 cases were recommended to the high courts for winding up. Draft schemes were also formulated for 39 cases and show-cause notices for winding up issued in respect of 68 cases; and sale of one unit was permitted. Amongst the cases approved 47 were for merger, 38 for management change and only three were for workers' co-operatives. The proportion of cases effectively decided to those registered with the BIFR till the end of December 1992 was 71.4 per cent and the ratio of companies on the revival path to those on the road to liquidation was 2:1.

Thus the BIFR route for resolution of industrial sickness has a strong rationale—it is a more balanced, realistic procedure, taking the interests of all into account. If public policy has a role to play in our unequal society, institutional arrangements such as the BIFR are essential. Once the appropriate norms are set, a neutral body could decide on the revival versus exit question. Otherwise labour could be thrown out of employment on the whims and fancies of businessmen. It is also a route which would go to protect the scarce resources of the community sunk in industrial units to which there is a signifi-

cant social cost attached. There is indeed scope for shortening the legal processes. It is known how the banks and financial institutions have been extremely reluctant to support revival packages. This has happened particularly in cases where employees of sick units have come forward to form labour co-operatives and offered to run their units. The government and the financial institutions have, let us face it, shown an ideological bias against labour co-operatives.

MIGRANT WORKERS

Avoidable Confusion

ADDRESSING a seminar on migration to the Gulf in Thiruvananthapuram, P A Sangma, central minister of labour, reportedly disclosed that, with the relaxation of the emigration clearance requirements, the number of persons migrating every year had shot up from 1.5 lakh to 4.4 lakh, signifying an almost three-fold jump in the emigration of workers of the categories requiring clearance.

This raises a number of questions, the most important of which is whether the figures indicate a genuine jump in emigration. Could it be that persons previously emigrating illegally and without due authorisation, in order to avoid the hassles involved in obtaining emigration clearance, have started going in for the stamp of clearance? And that too in such large numbers? Doubt arises in this regard because to the extent that these figures indicate a shift from illegal to legal worker migration, it would mean revising all past estimates of the extent of illegal emigration. It was believed that in the stock of migrant workers from India in West Asia, the ratio of legal to illegal workers was 2:1. That estimate will need to be revised if the latest jump in the figure of worker emigration is indicative entirely of a shift from illegal to legal emigration. In the flow, as distinct from the stock, the ratio between legal and illegal emigration, before the relaxation of clearance requirements, would have had to be 1:3. In knowledgeable circles, there is none who would stand by this ratio. Even assuming that a part of the jump in the figure is accounted for by the return outflow of workers who had to be repatriated at the time of the Gulf war (roughly 1.3 lakh out of the 4.4 lakh) still the balance left, viz, 3.1 lakh, is twice the figure of emigration for the previous year.

If the explosion in the figure of current emigration is not entirely accounted for by a shift from illegal to legal emigration, does it mean that there is to that extent a genuine increase in the emigration of workers from India to the Gulf? At least, the various international agencies monitoring the inflow of migrant workers to

West Asia have not reported any massive increase in such inflow. If anything, one reads reports of new restrictions on such inflows. In Kuwait, for instance, a limit is reported to have been placed on the number of foreign housemaids a household can employ. Before the Gulf war, there were families employing four to five foreign maids. India was believed to account for almost one-quarter of the stock of foreign housemaids in Kuwait. It is not known how many of the older Indian maids have gone back to Kuwait and how many new have gone in addition. But, to the extent that the jump in the figure of worker emigration does not reflect a shift from illegal to legal emigration, the expansion in worker emigration, including that of women, would indeed seem to have been on a phenomenal scale.

All this uncertainty about the actual state of emigration would not have arisen if the government of India were more forthcoming at least with the information it already possesses on the subject. At any rate, the doubts would then have been of an entirely different order.

FAMILY PLANNING IN CHINA All Coercion?

HOW much truth is there in the stories currently making the rounds in the western media, especially in the US, of the sort of punishment and humiliation being visited upon families, particularly women, in China for births that are not permitted, either because they are in excess of the number a woman is allowed or because they are inadequately spaced or even because the regional target has been reached already?

There can be no doubt that the publication of these stories has been so timed as to bring maximum pressure on president Clinton who recently announced that he was lifting the ban imposed by Ronald Reagan on the financing of the United Nations Population Fund. One of the major reasons for Reagan having cut off financing for UN activities in the sphere of population planning was that part of the UN funds were going to China even though it was pursuing "a coercive family planning programme". In fact, right now the US administration is also seized of the question of renewing the Most Favoured Nation treatment of China. And it could well be that the stories of atrocities committed by the family planning bureaucracy in China are inspired in order to influence that decision as well.

It is a fact that the Chinese authorities have been worried in recent years, since the late 80s to be specific, that their population growth targets may be exceeded. So in early 1991 it was decided at the

highest level to tighten the family planning programme and strengthen its enforcement. As part of this decision, a sort of 'responsibility system' was introduced under which provincial leaders farmed out family planning targets all the way down the chain of command. Failure to meet these targets meant penalties or even dismissal of the functionaries. As a result, there was a 25 per cent rise in 1991 in the number of people, mostly women, who were sterilised to 12.5 million. In 1992 the number of sterilisations is reported to have come down to 6.5 million, but the explanation is that "most women of child-bearing age had been sterilised by then". Other indicators of achievement, however, are that by 1992 considerable success had been recorded. The birth rate in 1992 was 18.2 per 1,000 as against 23.33 in 1987. Total fertility rate is expected to have dropped to 1.8 or 1.9 in 1992 compared to 2.3 in 1990. Only 9.6 per cent of all births in 1992 were third, fourth or fifth child; the figure for 1988 had been 15.4 per cent. The proportion of couples sterilised or using contraceptives rose to 83.4 per cent as against 71.1 per cent in 1988.

So there can be no doubt that in China impressive progress has lately been made in family planning. But is this achievement the consequence of the alleged harsh measures or of a predominantly voluntary acceptance by the people, rural as well as urban, of the imperative of family planning in a society already teeming with numbers while struggling economically? The answer will have to come from objective assessments and not from inspired, selective reporting of isolated cases of excesses.

PAKISTAN Yesterday's Freedom Fighters

WHETHER or not the presence of a sizeable contingent of Arab freedom fighters in Pakistan was a bone of contention between Ghulam Ishaq Khan and Mian Nawaz Sharif, it certainly was an issue on which Jamiat Islami parted company with the latter and made him more vulnerable. Lately Nawaz Sharif's government had, under pressure not only from western governments, particularly the US but also from several Arab countries, started to force these liberation fighters to leave Pakistan; indeed there have been reports of arrests and forced expulsion in recent months. Whether or not the interim administration of Balakh Sher Mazari is continuing the policy of its predecessor is not clear. However, the pressure from the US has been mounting in the wake of reports that those alleged to be involved in the bomb blast at New York's World

Trade Centre had been trained and equipped in Pakistan and had even emplaned from Pakistan for the US. So it is most unlikely that the Mazari government will want to invite US ire by relaxing pressure on Pakistan's Arab guests, now turned undesirable aliens, even though it may not openly profess strong action against them. In fact, the latest reports are of continued crack down on people described as 'possible terrorists and illegal aliens'.

The presence of these very liberation fighters in Pakistan was not only condoned by the US administration for several years, but they were armed and financed out of US funds funnelled to Afghan mujahideen groups in Pakistan fighting the Soviet-propped regimes in Kabul. The purpose of financing the Arab liberation fighters was not only to strengthen the opposition to the Kabul regimes but also to relieve the pressure of fundamentalist groups in the countries of origin of these Arab liberationists. Egypt which was supposed to have contributed the largest number to the Arab contingent in Pakistan (close to 20 per cent of the over 6,000 aliens registered with the Pakistani authorities) has been perennially dogged by problems posed by its fundamentalists. But lately these groups seem to have stepped up their activities and are targeting not only those closely associated with the present regime but also tourists. Tourism is the single-most important source of foreign exchange earnings for Egypt, accounting for over \$ 2 billion annually. So Egypt is among the countries which have complained about Pakistan harbouring terrorists. Algeria too is reported to have lodged a similar complaint with the Pakistani authorities. So the US is not alone in this regard.

The question to ask is whether the Frankenstein that was knowingly created within Pakistan, ostensibly to support the Afghan mujahideen groups in their armed struggle against the Kabul regimes in the name of religious freedom and democracy has now been rendered dysfunctional and is looking for other outlets for its operations. It is significant that in Pakistan there is an articulate, though possibly not numerous, section of public opinion which is openly critical of the government's crack down on these people. It is one thing to want to expel them; another to be able to do so when no other country, not even their own country, wants to own them, except possibly as proclaimed offenders. It is a moot question therefore whether, given the internal political uncertainties in Pakistan, it will be possible for the authorities to keep this altogether self-inflicted menace in check. Whichever regime succeeds the present interim administration will have its hands full coping with this burning problem.

Pasari Spinning Mills

PASARI SPINNING MILLS, promoted by Pasari Export, a government of India recognised export house, and G S Gupta and Associates, is setting up at Nanjangud, Karnataka, a cotton yarn spinning unit with 5,750 spindle capacity at a total capital outlay of Rs 650 lakh to be met by equity capital of Rs 585 lakh (promoters Rs 234 lakh and public Rs 351 lakh), central subsidy of Rs 15 lakh and lease finance of Rs 50 lakh. The entire project has been planned for a spindle capacity of Rs 25,000. The company proposes to achieve this spindle capacity in three phases. The first phase covering 5,750 spindle capacity is scheduled to be completed by this June. As soon as the production target for the present spindleage is reached and the standard quality produce is stabilised, the company will be going in for an addition of 6,000 spindles to be completed in June 1994. The third and final phase of the remaining 12,000 spindle capacity will be completed by December 1995. The projected turnover for 1993-94 (nine months), 1994-95 and 1995-96 based on capacity utilisation of 80, 90 and 95 per cent is Rs 306, Rs 478 and Rs 526 lakh respectively and the net profit Rs 58, Rs 112 and Rs 133 lakh. To part finance the project, the company is entering the capital market with a public issue of Rs 35,10,000 of Rs 10 each for cash at par aggregating Rs 3.51 crore, out of which 10 lakh equity shares of Rs 10 each totalling Rs 100 lakh are reserved for NRIs with repatriation benefits. The issue opens on June 16. Listing will be done at Bangalore, Bombay and Calcutta stock exchanges. Canara Bank Merchant Banking Cell and Times Guaranty Financials are the lead managers to the issue.

Indsil Electrosmelts

Indsil Electrosmelts, Travancore, which is setting up a Rs 12 crore project to be going shortly on stream to manufacture 7,800 tonnes per annum of ferro silicon, has some very distinctive features, not the least of which is that it has the largest captive private sector hydel power plant to generate 71 MW to provide a source of energy at low cost. The company has signed an MOU with the Kerala State Electricity Board to establish a 71,000 KW project at a cost of Rs 45 crore. The company is backed further by a successful record of the promoter, S N Varadarajan, a technocrat who indigenised ferro silicon manufacture in India and who has succeeded in establishing and operating several ferro silicon plants in the country. Sun Metals and Alloys, which is the promoting company of Indsil Electrosmelts, was established by Varadarajan in the same line of activity way back in 1982 and has a consistent track record of payment of high dividends—35 per cent successively for the last five years. Sun Metals and Alloys will be providing design and technology free of cost. The project is fast getting under way and is expected to be

commissioned by November 1993 to fill the gap estimated at 60,000 tonnes in ferro silicon supply by the end of the Eighth Plan. The project is estimated by IDBI to cost Rs 1,170 lakh, which is to be met with term loans of Rs 445 lakh from the IDBI and further Rs 150 lakh from State Bank of India, Rs 100 lakh investment by Kerala State Industrial Development Corporation, promoters' contribution of Rs 190 lakh and by NRIs of Rs 75 lakh to the share capital, and public issue of equity shares of Rs 285 lakh. The public issue opens on July 6 under SBI Capital Markets and State Bank of Travancore as lead managers. Varadarajan, a recipient of the Udyog Patra Award, is the managing director of the company.

Vatsa Finance

Vatsa Finance, the company that made news as it commenced operations last year by offering private safe deposit lockers at low rentals, is now raising from the public Rs 4.50 crore by an issue of 44.86 lakh equity shares of Rs 10 each at par. The issue opens on June 2 under India Securities as lead manager. The present issued share capital of the company is Rs 3 crore. With the additional issue, the company is to meet its estimated requirements of funds of Rs 8 crore. Of this amount Rs 1.43 crore is the remaining balance cost of purchase of the premises at Lokhandwala complex in Bombay

and Rs 1.10 crore is towards interior designing of the premises in Opera House in central Bombay. It is at this latter premises that the company has decided to install 1,800 safe deposit lockers, while at the former place 1,023 lockers have become operational. The lockers are open 24 hours a day and 365 days a year. The company, promoted among others by Ganpati Exports (a Star trading house) and Rolex Holdings (an investment and loan finance company), has also on the agenda such other business as leasing, hire purchase and OTC market operations. However, the company is still to be recognised as a leasing and hire purchase company by the financial institutions. This is expected by 1994-95, while the company has also applied to SEBI for registration as Category I merchant bankers. As these plans materialise, the company will be augmenting resources with further issue of share capital. Indeed, a further issue of Rs 7.50 crore is projected in the next year, with which the issued share capital will stand doubled to Rs 15 crore. It is expected that Rs 3.50 crore of the additional share capital will come by way of conversion of the promoters' loan funds, while there will be a rights issue of Rs 4 crore to the shareholders. For the first half of the financial year to March 1993, the company reported a net profit of Rs 61,000 on a total income of Rs 19.40 lakh.

—JK

NATIONAL INSTITUTE OF PUBLIC FINANCE AND POLICY

NEW DELHI

SENIOR FELLOW (one post) in the scale of Rs 4500-150-5700-200-7300 plus allowances as per Institute's rules. Total monthly emoluments at the minimum of the scale will be around Rs 8,800/-. Higher start than the minimum in the scale may be given depending on qualifications and experiences.

Qualifications essential: A creditable academic record with Ph.D. in Economics and specialisation in public economics with a good background in macro economics theory and quantitative economics. Publications of high standard and at least seven years research or teaching experience in a University or government or a reputed research institution.

Desirable: Experience in empirical analysis of policy issues and policy modelling.

Selection may not be confined only to those who apply.

Other things equal, candidates belonging to Scheduled Caste/Scheduled Tribe will be given preference.

Applications indicating qualifications and experience supported by true copies of certificates and testimonials should reach the Director, National Institute of Public Finance and Policy, 18/2 Satsang Vihar Marg, Special Institutional Area, New Delhi-110067 within fifteen days of the date of advertisement.

Calcutta Diary

AM

The Bengalis in West Bengal cannot quite envisage what the future holds for them; they have also lost the confidence to proffer that they will build their own future. They, therefore, either take recourse to exercises in nostalgia, such as were witnessed a couple of years ago centring around the tricentenary celebrations of Job Charnock's Calcutta, or indulge in frivolities such as over the Bengali calendar entering a new century or West Bengal being given a new name. All such indulgences are escapes from reality.

THE one hundred eighty-first entrant to the United Nations, the Republic of Macedonia, has been admitted to the Turtle Bay outfit on a provisional basis. This is something unique. The Macedonian republic, one of the splinters resulting from the coming apart of Yugoslavia, is a member of the UN and yet not a member. The ambivalence has its reason. A province in Greece is also known as Macedonia; Alexander the Great had sprung from this tract a couple of thousand and odd years ago. Not unnaturally, Greece is feeling queasy: should the break-away segment of Yugoslavia be allowed to call itself Macedonia too, who knows, it might, one of these days, choose to turn a covetous eye on the province of Greece with the same name. Or some malcontents in the province might begin to dream of integration with the independent Macedonians across the border. The authorities in Athens have therefore posted their reservations with the United Nations: by all means accord formal recognition as a separate republic—and a member of the world body—to that particular relic of Yugoslavia, but let it pick another name for itself. The issue is still to be sorted out. The Republic of Macedonia is for the present in a limbo: it is a part of the United Nations, but it does not yet know its name.

This identity crisis is having a bit of an echo nearer home in West Bengal. Independence, and the partitioning of the country, saw the emergence of East Punjab and West Bengal as constituent units of the Dominion, later, Republic, of India. East Punjab became Punjab within a decade following independence, but the supposedly radical Bengalis have continued with the nomenclature of West Bengal for their state. They could have, at any time prior to 1971, easily re-named their state as 'Bengal' without raising any domestic or international hackles. The major part of pre-1947 Bengal Mohammad Ali Jinnah walked away with had metamorphosed into East Pakistan, so there would have been no scope for either heart-burning or confusion had West Bengal then decided to shed the 'West'. The Bengalis in India—or, rather, the politicians in Calcutta—however dithered.

This indecisiveness was the contribution as much of the original residents of the districts comprising the territory of West Bengal as of migrants from the eastern wing of erstwhile Bengal. People and political personalities hailing from the West Bengal districts did not quite relish the idea of their demesne losing its distinct identity: till as long as West Bengal remained West Bengal, they could claim to be the rightful inheritors of the land, those who crossed over from the eastern districts merely being their guests; were the state to be re-christened as just 'Bengal', their status as legatees and hosts, they feared, would be obliterated. The migrants from the eastern Bengal districts suffered from a different hang-up. Given their roots in an overwhelmingly riverine culture, they were inveterate romantics. Till as long as the land to which they had migrated was described as West Bengal, they could console themselves that they were only transient residents in an alien land, their natural habitat was East Bengal, to which, circumstances permitting, they would one day return. Once West Bengal was rudely rendered into Bengal, it would in effect be short shrift to that kind of romantic day-dreaming. So they too were for the maintenance of the *status quo*. It was thus an equilibration of two parallel reluctances, and West Bengal has remained West Bengal through the post-independence decades.

Not that this situation mattered a great deal. Political commentators would sometimes draw attention to the anomaly of the simultaneous existence of a Punjab liberated from the immediate post-partition pre-fix and a Bengal still fastened to the apron-string of a 'West'. West Bengal ministers would complain from time to time that, given the alphabetical happenstance of the state's nomenclature, they have to sit, sandwiched between the representatives of Tamil Nadu and Uttar Pradesh, waiting, for hours on end, for their turn to come before they could make their presentations at meetings of the National Development Council or at conferences of chief ministers. But indecision got the better of their occasional irritation. If only they had so wanted, West Bengal could have been given the formal

name of Bengal, pure and simple, or even Bangladesh, and the world would have duly got used to the new nomenclature.

West Bengal missed the bus. 1971 transformed the complexion of the problem. That year saw the re-emergence of East Pakistan, following what the natives love to describe as the war of liberation, as 'Bangladesh'. Even though often disparagingly referred to as a bread-basket case, Bangladesh is very much a recognised international entity, and has pre-empted West Bengal from the opportunity of calling itself, at this late hour, by that name. Should the Bengalis in India insist on opting for this name and the Indian authorities formalise such a re-nomenclature for West Bengal, there could be in the United Nations a Macedonia type of confrontation, with this qualitative difference that, instead of a new member of the international body attempting to appropriate the name of a province which is an integral part of a member-state, a member-country would venture to adopt the name of a neighbouring member-country of the United Nations as description for one of its parts. It is not even certain that should West Bengal decide to re-name its territory as 'Bengal' from now on, Bangladeshis would put up with that either. 'Bengal', they might argue, is phonetically much too close to 'Bangla'; it is, they could point out, actually the Anglicised form of the latter.

And that would not be quite the end of the story. Even were there no objection raised from across the border, reservations could be voiced about choosing the name 'Bengal', bare and unadorned, from the politicians of West Bengal itself. 'Bengal' might be all right for purposes of documentations in English, but there was need, they might argue, for a second nomenclature which was indubitably Bengali, and which could enter the currency of other Indian languages as well. A couple of months ago, a West Bengal minister floated a trial balloon. Would 'Banga' do as a new name for West Bengal, he enquired with some diffidence. The suggestion was received with unmixd hostility from different quarters. 'Banga', the cognoscenti concluded, was much too drab, much too limp, it did not quite convey the lyricism of the Bengali milieu. What they most missed was the lilt of the substantial consonant 'l'. This consonant apparently packed a lot of history. The territory familiarised as 'Banga' in early Sanskrit literature, and so written in Brahmi script, gained, once it passed through the filter of Prakrit and Pali, that extra 'l', never mind where exactly it was placed. In case you dropped the 'l' from 'Bangla'—or 'Banga' as the Lodis and the Mughals preferred to call it—check with the Bengalis, you would deprive their land of its virility.

Perhaps it would be risking a linguistic riot to suggest that that is precisely it, the Bengalis are expending so much of time on such a trivial issue because of a gradual

ebbing away of their *elan vital*. Arrange a Cook's tour of West Bengal; what would most strike you is the drying up of the Bengali imagination. There is evidently a shortage of great causes in the neighbourhood. Radical politics, the traditional forte of the Bengalis, has been played into a difficult corner. Between Mikhail Gorbachev and Boris Yeltsin, they have, for the present, done a neat hatchet job of socialism and command economics. Russian hyperinflation has re-kindled some hopes in the minds of the countless Bengalis aghast at the treatment meted out to Marx's magnificent social dynamics. The circumstances nonetheless remain dicey. A quarter of a century ago, Mao's China was a major stirrer of Bengali emotions. The degeneracy of that land into so-called market socialism has once more put out the candles. The Indian Constitution and the relationship it adumbrates between the centre and the constituent states make it well-nigh impossible for a state to strike out on a course of independent economic development. This had for some while provided grist to Bengali polemics. Unfortunately, the war against iniquitous centre-states relations cannot be pursued with the same vigour as in the days of yore; to do so would be to offer objective help to the monkey brigade of the Vishwa Hindu Parishad. Ever since the dismissal of the BJP governments in the four Arvavarta states, that party has discovered some pristine virtues in the slogans coined by West Bengal's Left Front pertaining to centre-states relations; the Bengalis necessarily have to increase their distance from the slogans. There are other impediments to radicalism. The next logical step in land reforms, co-operative agriculture, is, it seems, a bit too much for the naturally-divisive Bengalis. Decentralisation of power in the countryside through the panchayats has a certain attraction, but how far can power go without finances, which are tightly held by New Delhi. In any event, the centre's revisionist policies have cast a pall on the process of economic growth in the entire country; West Bengal is only a spec, the millions of its unemployed do not quite know which direction to turn; they therefore turn to watching the gyrations of the Sri Devis and the Divya Bharatis, the lowest common denominator bringing India together.

True, the Bengalis once used to boast of their poetry and literature and theatre and cinema. The bulk of the better genre of poetry in Bengali is however now being composed in Bangladesh, which has also graduated as being the epicentre of more serious research on the problems of Bengali language and historiography. The richness as well as the elegance of the Bengali as spoken in Bangladesh are of a much superior category compared to the stylised *patois* of Calcutta and West Bengal. Even Tagore songs, the supposed *summum bonum* of Bengali sensitivity and sophistication, are sung with immeasurably

greater splendour in Bangladesh. The Bengali species of the *cinema verite* has lost out to the Shabana Azmis and the Om Puris of Bombay; even the later Satyajit Ray films, while they would win national and international accolade, would bomb in the box office. Making a serious film in Bengali is now out of the question unless government subvention is made available. Utpal Dutt is gravely ill, Sambhu Mitra has gone into sullen hibernation, the rest of the Bengali stage is little to write home about, except perhaps some occasional pyrotechnics from Tapas Sen, the lighting genius. Bengali journalism, what is the point of mincing words, has reached its nadir, its instinctive dislike of socialism of any variant has pitted it against the Left Front; almost each journalist feels himself *engage*; since the faction-ridden Congress party has little future in the state, the journalists cling to their wild fantasy of a Queen Boadicea of most suspect credentials teaming up with the Hindu fundamentalists to usher in a new millennium. The fare served by local radio and television is the last word in illiteracy; it has been rendered more so by its contents being decided by an equally illiterate bureaucracy in New Delhi.

It would be idle to pretend that, given this milieu, either a people or their government would think great thoughts or dream

great dreams. The Bengalis in West Bengal cannot quite envisage what the future holds for them; they have also lost the confidence to proffer that they will build their own future. They therefore either take recourse to exercises in nostalgia, such as were witnessed a couple of years ago centring round the tricentenary celebrations of Job Charnock's Calcutta, or indulge in frivolities such as over the Bengali calendar entering a new century or West Bengal being given a new name. All such indulgences are escapes from reality. There is something overwhelmingly symbolic in the moral stance of a social science research unit in Calcutta. It has on its roll an enviable number of first rate economic analysts, vastly read historians, perceptive sociologists and outstanding political scientists. They however hold in total disdain contemporary issues and problems, nor are they prepared to engage themselves in serious research concerning any aspects of West Bengal's—or India's—future. They believe in *post mortem* explorations, but only if the corpse is at least one hundred and fifty years old.

Nothing specific about this necrophilia, it is a disease which has assumed epidemic form in the state. Whether, in the epoch of Asoka, these particular tracts were known as 'Banga' or 'Bangal' is a dead-end debate which illustrates the disease.

CENTRE FOR DEVELOPMENT STUDIES THIRUVANANTHAPURAM

The Centre invites applications for the following senior faculty positions

A) Fellows (Equivalent to Professors)

The required backgrounds for the position of Fellows are (1) Economic Theory, with emphasis on Macro Economic Analysis and (2) Agricultural Economics

One position of Fellow is under the Reserve Bank of India Endowment Scheme for which the applicant should have demonstrated ability and aptitude to carry out research on developmental issues

B) Associate Fellows (Equivalent to Readers)

The applicants for the position of Associate Fellows should have specialisation in Public Finance or International Economics or Population and Development Studies.

For all positions, the applicants should have a doctoral degree, independent published research of high quality, and relevant teaching experience at the post-graduate level. Salary and allowances are according to the U.G.C. pattern. Please send detailed curriculum vitae and copies of major publications to the Director, Centre for Development Studies, Prasanthnagar Road, Medical College P.O., Thiruvananthapuram 695 011 before June 30, 1993.

DIRECTOR

NEW DELHI

Double-Talk on EFF

BM

While within the country the government has been trying to give the impression that in view of the high level of foreign exchange reserves and the general success of the economic reform programme it was no longer in a hurry to negotiate an EFF arrangement with the IMF, finance minister Manmohan Singh's principal task during his recent visit to Washington was to convince the IMF of India's need for an EFF credit and to clear the way for formal action for securing it.

THE Congress(I) government at the centre has survived fairly easily what should really have been a trying budget session of parliament. This has happened in spite of the intense factional tussle within the ruling party a stark display of which was found at the Surajkund session of the party midway through the parliament session and which has not since looked like subsiding in spite of the crude efforts of the dominant faction to assert its supremacy. The flow of foreign credits and direct investment has become uncertain and the government's foreign support base is often seen to be wobbly. If the minority government has still survived, it is because the opposition parties in parliament are also afraid of the government falling, which would result in the holding of general elections and testing of the mettle of these parties. In the closing stages of the budget session, the opposition parties did combine behind the motion for the impeachment of justice Ramaswamy. Though the position of the ruling party on this issue was very awkward, the opposition parties still failed to secure the passage of the motion. To frustrate the opposition bid the ruling party leadership was willing to risk the odium of shielding those in high places found to indulge in financial malpractices.

A necessary concomitant of this state of affairs is that while the government's political and moral authority is getting weaker by the day, there is allround deterioration on all fronts—economic, social and political. While speculators and black money operators are ruling the roost in the market, infrastructural bottlenecks are worsening. Crime is on the rise. While chauvinistic postures are struck with the focus on Pakistan, the readiness to succumb to G7, particularly the US, pressures is becoming palpable. It is not surprising that the government is being called upon to take satisfactory measures in advance of

foreign credits being disbursed even after they may have been sanctioned. Similarly, foreign investments are being held back even after they may have been approved so that the investors' conditions and terms are fully and speedily implemented by the government. In this process the government has become more vulnerable to foreign pressures. Witness the agreement to provide sovereign guarantees for high returns on foreign investment and the encouragement of multinational corporations to take over even existing Indian business enterprises, in both the public and private sectors. Witness also the application of the Special 301 clause of the US trade law and the lackadaisical response of the government.

The issue of so-called trade-related intellectual property rights and amendment of India's patent law to enable multinational corporations to extract super profits from the sale of products under patent protection in such areas as drugs and processed foods is becoming an increasingly contentious issue. The US administration has queered the pitch by again invoking Special 301. The US has already withdrawn preferential tariffs for some Indian goods exported to the US. Commerce minister Pranab Mukerjee has stated that the government's stand was not to engage in bilateral negotiations with the US but to negotiate the issue of intellectual property rights under the GATT. However, as a statement signed by as many as 250 MPs last year had pointed out, "the worst aspect of the GATT Agreement/Treaty is that the role of parliament in law-making will be substantially curtailed". The MPs had therefore demanded that "to protect the sovereignty and dignity of the Indian people and parliament, we seek that the government place a resolution to reiterate the need for the ratification by parliament of international treaties entailing the introduction

of new legislation and wholesale amendment of existing legislation and incurring financial costs. This will ensure the Indian people and parliament that the debate at the GATT treaty ratification stage will not be a mere formality."

There is clearly need for working out the government's approach in the GATT round as well as on Special 301. The government cannot remain content with procedural objections to Special 301 and let a clear enunciation of its policy on intellectual property issues go by default. There are serious misgivings that the minority government might succumb to pressure surreptitiously in closed-door negotiations not only under GATT but also bilaterally with the US.

The government's position on seeking fresh financing from the IMF too has been ambiguous. Before the finance minister went to the just-concluded meetings of the IMF and World Bank at Washington, there was excited talk that, with the rise in foreign exchange reserves, it may no longer be necessary to go for a loan under the EFF with its stiff conditionalities. The idea obviously was to create the impression that the government had regained its initiative to bargain with the foreign creditors and the international financial institutions. The same message was sought to be conveyed by the assertion, repeatedly made, that the phase of crisis management of the economy, especially on the external front, was over. All this was intended to impress public opinion in India when the government's political credibility had touched an extremely low level and the truth came out in Washington that the government's request for an EFF loan of \$ 9 billion over a period of three years has been pending before the IMF management for consideration for quite some time, in fact as an extension of the stand-by credit arrangement. One of the tasks before Manmohan Singh in Washington was to explain the government's need for this credit and clear the way for formal action for securing it. There is much satisfaction in finance ministry circles that the managing director of the IMF responded favourably to this position. When the deal on the EFF is clinched is, however, something to be watched. There is going to be an interval between the drawal of the final instalment of the stand-by credit of \$ 2.3 billion and the sanction for the EFF loan. Such a gap was not originally envisaged and the stand-by credit was to be smoothly converted into the EFF. Something has obviously gone wrong. Snags have evidently developed in the implementation of the IMF-stipulated reform programme.

The IMF-World Bank combine, it appears, wants India in a corner where there is no scope for any deviation from the combine's standard policy prescriptions. This position appears to have emerged after the review of the government's performance carried out by an IMF team in March this year. A probation period has evidently been specified for the government before negotiations for the EFF loan can be resumed, probably early next year. The World Bank, working in concert with IMF, may also sequence on the same basis the disbursement of its own loans as well as the loans it arranges from foreign governments on a bilateral basis. The annual meeting of the Aid India Consortium in June or July this year may thus pose ticklish problems for India's aid diplomats. How far the government can go to satisfy the conditions laid down by foreign creditors and investors when it is on slippery political ground domestically is a moot point.

It has been noted in this context that the government had to buy the smooth passage of the finance bill through parliament by pandering to a wide variety of vested interests. The once-aggressive economic reformers in the government have lost much of their élan. The government had found it necessary to give away as much as Rs 4,500 crore at the time of the presentation of the budget for 1993-94 and follow this up with an additional concessions of Rs 429 crore before the passage of the finance bill could be secured.

The income tax exemption limit has been raised from Rs 28,000 to Rs 30,000, the earlier categorical stand of Manmohan Singh against such a change notwithstanding. In addition, the ceiling on tax deductions in respect of dividend and interest incomes has been raised from Rs 7,000 to Rs 10,000. The notion of widening the social base of direct taxes has been found to be too difficult to enforce. The subsidy on phosphatic fertilisers, abolished at the time of presentation of the budget, has been reintroduced to buy peace with the farm lobby, in particular the Ajit Singh faction in the Lok Sabha. The raising, step by step, of the output limit for excise duty exemption for small industry units from Rs 7.5 lakh to Rs 30 lakh is another case in point. Adjustments in customs duty have had to be made in response to business interests engaged in import-intensive manufacturing. It is not surprising that the sharp bearish pressure on the stock markets has somewhat eased after the passage of the finance bill. Manmohan Singh's assurances that he would implement the Chelliah committee's report on corporate taxation in the course of the current year itself seems to have had an impact. That Raja Chelliah has been inducted into the finance minis-

try as fiscal advisor with the rank of minister of state is intended to add weight to these assurances.

Reduction in the fiscal deficit of the government from 8.5 per cent of GDP when the reform programme was launched to 6.5 per cent at the end of 1991-92 and 5 per cent in 1993-94 is, however, a critical parameter on the basis of which the IMF/World Bank keeps a close watch on the government's performance. The first year, 1991-92, saw a strong fiscal correction by halting of all development and sharply deflating the economy. Last year, 1992-93, when the government was found to be lagging behind in the reduction of the fiscal deficit to the agreed level, the IMF actually withheld the release of an instalment of its stand-by credit. The government subsequently made good the deficiency and the flow of IMF and World Bank credits was resumed. The problem is that the default in respect of achieving the fiscal deficit target in 1992-93 and 1993-94 has now become glaring. While the government is unwilling to raise additional revenue to meet its current expen-

diture, it is also finding it difficult to contain the increase in expenditure. This is attributed to the political constraints which the minority government must reckon with in order to survive. The government no doubt hopes that the World Bank/IMF combine and its political masters will appreciate this position and allow greater accommodation in implementing the agreed structural adjustment programme. It will be interesting to watch how far this hope fructifies. The fact must be reckoned with that while the IMF/World Bank may continue to give assurances in public of full support for the government, the actual bargaining is bound to be tough. Significantly in this context, IMF/World Bank spokespersons have been emphasising that India's foreign debt has already reached a high level and that India's external financing needs will now have to be met by 'non-debt' financing, a euphemism for foreign direct investment. Hence the stress in policy adjustments may be expected to shift to facilitating the operation of multinational corporations on specially favourable terms.

INTER-UNIVERSITY CENTRE (UGC)

Indian Institute of Advanced Study

Rashtrapati Nivas, Shimla - 171005

Advertisement No. 4/93

Applications on prescribed form are invited from University and College teachers for Associateship of the Inter-University Centre for Humanities and Social Sciences for three years from 1994 to 1996. The Centre provides opportunities of research and academic interaction in Humanities and Social Sciences. The selected Associates are expected to pursue research, revise theses, or write on the basis of research already done. Broad terms and conditions governing the scheme of Associateship are as under:

1. Minimum stay at the Centre: One month, maximum possible stay at the Centre: three months.
2. Maintenance Allowance (Rs 100/- per day) For the days of stay at the Centre.
3. Travel Expense: Actual return fare for the entitled class limited to AC II tier sleeper.
4. Accommodation for self only.
5. Free medical attendance.
6. Library facilities and secretarial assistance.

The prescribed application form may be obtained from the Deputy Secretary (Administration) of the Institute by sending a Self Addressed stamped envelope (25cm x 10 cm) affixing postage stamp worth Rs 2/- (Rupees two only by ordinary mail) or personally from the Institute by July 15, 1993. The completed application forms should reach the Institute latest by August 31, 1993.

Applications should be routed through proper channel.

India Turns Clock Back

Gautam Navlakha

The decision to impose army rule in Kashmir, in effect if not formally, represents a tragic turn of policy, as much for India as for the people of Kashmir. Step by step the government has been moving in precisely the direction which the BJP and the Hindu chauvinists have been urging it to take.

IF the government of India was toying with the idea of preparing the grounds for a settlement in Kashmir, the exercise was aborted even before it was tried out seriously. The much trumpeted appointment of former army chief K V Krishna Rao as governor on March 11 along with a new team of advisors and a shake-up in the senior echelons of the security forces was supposed to signal this. This was to be accompanied with a financial package of nearly Rs 1,000 crore to tide over the liquidity crunch faced by the state. It was believed that such a package will help revive economic activity and thereby break the vicious cycle of curfew/bandh. The third element of the new initiative in the state comprised granting amnesty to all those against whom there are no serious charges, and who may be willing to give up terrorism as a vehicle to seek redressal of political and other grievances.

The financial package is the relatively easier issue to resolve. But the administrative shake-up took some time to initiate. This indicated sharp differences in decision-making circles between those espousing continuing the militaristic line and those who give relatively more weight to administrative-political initiatives. Some of the steps that are still being talked about, albeit with far less conviction, become important. Re-establishment of the administrative structure to make it not only functional but responsive to the needs of the people, checks and balances to end the excesses of the security forces and provision of avenues for the people to ventilate their grievance are some of the suggestions that were bandied about. Any enlightened government would consider the above measures as part of its normal functioning. However, coercion has been the central plank of the government's policy towards Kashmir. And the slightest move away from this has been considered a dilution of the government's commitment to fight 'secessionism'. As a matter of fact it is this approach that has ensured a groundswell of support for militancy, which touched new heights when Jagmohan entered the valley in January 1990.

There are, however, indications of a wider willingness to question the existing policy towards Kashmir. First, after December 6 and the pogroms in Bombay, Bhopal, Surat,

etc, the Sangh 'parivar' has lost some of its gloss. This is reflected in the expose of the temples-have-been-destroyed-in-Kashmir lie pedalled by Sangh 'parivar' by some large circulation newspapers and journals. For three years neither the government nor the media had bothered to investigate this matter. This was an important propaganda issue raised by the BJP during two elections. Second, it is no longer possible to whitewash the communal prejudices of the security forces and the administration. A section of the intelligentsia is willing to discuss and give sympathetic hearing to allegations against the security forces who are no longer treated as sacred cows. Third, international pressure, in the shape of criticism of India's dismal human rights record as well as of proposals from India's international creditors for resolving the India-Pakistan dispute over Kashmir, have compelled the government to appear to be moving towards political initiatives. The statement of the US deputy assistant secretary of state, John Malott, to a US Congressional Sub-committee that "any solution... must take into account the views of the Kashmiri people themselves" and that the US is willing to act as a mediator are the strongest possible hints of the US administration's intentions. In this connection, the recent discussion on Kashmir organised by the Rajiv Gandhi Foundation may be regarded as a semi-official exercise undertaken by Indian and US academics and other former officials, pointing towards a re-thinking in some sections of the government.

HARDLINE APPROACH

However, while one welcomes any lessening of the terror under which Kashmiris have been compelled to live, be it through an administrative reshuffle or restoring the primacy of the civil administration, there is need to be cautious. For one, it is high time it is acknowledged that anti-India sentiment has hardened in Kashmir. This cannot be brushed aside as the result of a Pakistani conspiracy and disinformation spread by militants. Militancy is indeed only an expression of alienation and anger. For another, whatever sensitivity the government of India has shown towards human rights violations in Kashmir has been directly related to

outside pressure. Tragically, US and western preoccupation with 'Islamic fundamentalism' spreading across the Central Asian Republics dilutes the pressure on India for complying with constitutional and international norms of civilised behaviour, irrespective of whether Kashmiris are considered citizens or enemies.

The noticeable thaw in some sections of the Indian intelligentsia is matched by a hardening of positions in other circles. Hardly a voice is heard in parliament protesting the disempowerment of Kashmiri people or denouncing the repression there. In the event, the recent decision to hand over operational control of Kashmir valley to the army is an unmistakable sign of a step up in the militarisation of the valley.

Officials claim that the decision to hand over the valley to the corps commander J and K, Lt-General Surinder Nath, and Srinagar to the BSF was to get around the problem of co-ordination among the security forces. However, the decision was accompanied by deployment of additional two divisions by the army in the valley for ground level operations, including cordon and search operations. What is more, while the advisor to the governor, Lt-General Zaki, will co-ordinate security measures, day-to-day control will be exercised by the corps commander who now takes over the overall command of all operations. All but in name Kashmir valley is under military rule. At the same time, a so-called multi-media cell in New Delhi which is headed by a senior bureaucrat has proposed banning publication of 'provocative' statements and visual material by 'outlawed' organisations. It is argued that this will curb the influence of the 'secessionists' over the Kashmiri press. This is only a convoluted way of bringing the Kashmiri press to toe the government of India's line. It is instructive to note that these changes are all in line with the demands voiced by the Sangh 'parivar'.

Officials claim that the hardline approach towards militancy has shown itself to be successful. They confide that militants are on the run and some of them are suing for peace. The 'success' of Punjab is flaunted to buttress the claim that the same can be achieved in Kashmir. This, in any case, was also the thrust of the Punjab chief minister at the Faridabad AICC session when he argued against any dialogue with the militants or any relaxation of the repression.

The government of India has all along insisted that India is fighting a proxy war in Kashmir. In turn this leaves the government undecided about the status of the Kashmiris, i.e. are they to be considered citizens or not. All avenues for redressal of grievances have been closed, reports of excesses of security forces are routinely dismissed as disinformation, and the constant harping on Pakistan and Islamic fundamentalism lends credibility

to the view held by Kashmiris that it is their Muslimness that sets them apart. Indeed this perception has gained ground with the demolition of the Babri Masjid and the anti-Muslim pogroms across India. It is this psychological and emotional state that has pushed the demand for self-determination to the forefront.

ETHNIC CLEANSING?

While the government's response is to suppress this by force, more chauvinistic elements within Indian society have been going a step further by demanding 'demographic Indianisation' of the valley, which means settlement of Hindus there. This insidious demand remains on the agenda of the RSS 'parivar' and was confirmed by the RSS rally in Delhi on November 8 last year where the demand was made for settling retired defence personnel belonging to Dogra community in the valley.

As if this was not enough, union home minister S B Chavan informed parliament on February 26 and March 1 that the government has 'offered' the Kashmiri Pandits a 'safe zone' in any part of the valley of their choice. Since a section of the Kashmiri Hindu refugees have been demanding a 'homeland' for the Kashmiri Pandits north and east of Jhelum, i.e. covering more than half of the valley, it is implicit in the government's offer that they are moving towards vivisection of the valley along religious lines just as demanded by a section of the Kashmiri Pandits. There is another danger in this 'offer'. Since 'Hindutva' is described as the *sine qua non* of Indianness, the union home ministry's 'offer' could well become the first step toward realising some sort of 'ethnic cleansing'. Little by little the government is showing that its understanding of the Kashmir problem and solution are not very different from that of the Sangh 'parivar'.

In the last 38 months the widespread repression has affected every section of the population in the valley. For instance, it is known that for every militant arrested, more than 20 persons are 'interrogated'. Out of those arrested, how many have been arrested for being terrorists, and how many for the vague charge of 'abetment' is not known. Also not known are the routine arrests, torture and 'deaths in cross-fire'. Reports of custodial deaths under 'Operation Tiger' are legion by now. Even senior serving officers express helplessness when approached with individual cases of those raped or missing. They frankly say that they have no jurisdiction over the security forces. This writer has personal experience of approaching the minister for internal security with a list of 53 persons arrested since 1990 and whose whereabouts are unknown despite the high court serving notices on the authorities. Nothing has been heard of from the minister.

All allegations of rape are dismissed as disinformation by the militants to malign and demoralise the Indian security forces.

The havoc wrought upon the people of Sopore by the BSF saw them refusing to accept the compensation offered by the government. The burnings and killings at Lal Chowk in Srinagar which resulted in 280 deaths have been forgotten by the administration. The inquiry headed by the divisional commissioner of Srinagar was boycotted by the people. The mysterious killing of H N Wanchoo, trade unionist and human rights activist in the valley, who had meticulously compiled the list of custodial deaths, and the assassination of Abdul Ahad Guroo, a leader of the JKLF, raise disturbing questions about the role of the security forces. And now the death in BSF custody of a J and K policeman has brought out the ground reality of 'us' and 'them'.

FROM BAD TO WORSE

All in all, the government of India is caught in a web of its own making by stonewalling every possibility of a solution within the bounds of the Indian Constitution in the past and persisted with its policy of singling out militancy as the main issue to be tackled. The government's refusal to talk to anyone without first giving up arms amounts to asking the Kashmiri people to surrender to the Indian government's diktat before negotiations can begin. Ground reality in Kashmir is that the demand is for a referendum and after the sacrifices of the last three years, there is a sullen determination that there will be no turning back. The impasse thus created suits the purpose of those sections in India who advocate strong-arm methods as the only way out. But more than three years of trying to stamp out rebellion has only seen it grow. While normal life is completely dislocated, the only link the valley now has with India is the Indian military presence. From postal services to tax collections and from the local administration to the judiciary, nothing functions anymore. The nature of present link which pits Indian army against Kashmiri people leaves Kashmiris with no option but to be convinced that their very survival is at stake. Even if militarily India is in control of Kashmir it has lost it in every other way.

One cannot fault Pakistan for taking advantage of the discomfiture of the Indian government. Soon after thwarting the third attempt at crossing the line of control, the Pakistan government reminded India about its increasing difficulty in preventing Kashmiris from crossing the line of control and appealed to UN to prevail on India to realise the gravity of the situation and to move to resolve the dispute. The Indian government has shown much enthusiasm for involving outside powers by complaining about Pakistan and lately lobbying to have the US declare Pakistan as a 'terrorist state'. Internationalism is thus in-built in the situation, no matter how India and Pakistan look at Shimla Pact.

Consequently, after more than three years

as the situation turns from bad to worse, cost of maintaining Indian control will rise in terms of men and material. There are no longer any escape routes available in the form of elections or appointments of political advisors so long as the main issue of alienation is sidelined. Policy-makers are unable to comprehend that popular support for militancy refuses to decline because there is no solution in sight which comes anywhere close to popular aspirations.

Enlightened self-interest, therefore, demands that the government withdraw the *carte blanche* given to the security forces and prosecute the personnel of the security forces as well as the administration for crimes committed. If the Pakistani army can sentence to death an army major and send 13 others to life imprisonment for the killings at Tando Bahawal (Sind) last June, what makes the Indian security forces so special that they have to be treated with kid gloves? It should also be clear by now that militancy must be fought politically by weakening the bond between the masses and the militants. Unless justice is provided, fear and distrust will not end and support for militants will continue. Thus dismantling the regime of terror is the precondition for any solution. This alone will restore the political process and allow healthy contention between divergent objectives of various political groups within Kashmir to come to fore. This would also help preparations towards organising a trilateral conference among the governments of India and Pakistan and Kashmiri leaders essential for resolving the issue.

There is an urgency behind this. It needs reiteration that chauvinism and anti-Muslim prejudice all over India found sustenance in lies about destruction of temples in Kashmir or in ignorance of the facts of Kashmiri Pandit migration from the valley which actually accelerated after Jagmohan took over in January 1990. This should act as a reminder that if the policy of attrition is not rolled back, the consequences point in the direction of a xenophobic build-up which will pave the way eventually for 'demographic Indianisation'.

In some ways time is propitious for a new tack. Not least because the organised face of Hindu chauvinism in India can easily be put on the defensive. Also international pressure on India to take corrective measures is bound to mount because of the US-western preoccupation with the spread of Islamic fundamentalism. The joint US-Russian 'study mission' contends that "US and other western countries are wary of Kashmir's potential to explode into large-scale war and its entanglement with the spread of Islamic extremism". In that sense, the attempt at foisting leaders and striking deals with Farooq Abdullah deserves notice insofar as even the National Conference has been compelled to denounce state terrorism and has demanded that Amnesty International be allowed to visit Kashmir valley.

Panchayati Raj and Early Warnings of Disasters

James Manor

Panchayati raj institutions are not only a virtually foolproof source of early warnings about potential calamities, but also an effective means of ensuring that such warnings do not go unheeded.

I

JEAN DREZE, Amartya Sen and others have rightly called our attention to the role that a free press can play in providing early warnings of drought, flooding, food shortages, and outbreaks of disease which can mushroom into full-scale calamities if left unattended.¹ Indian journalists have repeatedly distinguished themselves on this front, but their counterparts in most of Asia and Africa are too constrained by government controls to achieve much.

All of this deserves to be stressed in order to encourage other nations to follow India's example, but we also need to pay attention to Indian journalists' own view of their effectiveness at providing early warnings. Reporters in northern Karnataka, some of whom have raised the alarm when calamities loom, stress two points. First, they are acutely aware of their own limitations as sentinels. Second, they believe that strong panchayati raj institutions of the kind that existed in Karnataka between 1987 and 1991 provide a far more reliable source of early warnings than journalists can. They emphasise, however, that such institutions can only be effective *if they are strong*. This latter point is immensely important just now, as various state governments are preparing legislation to bring their panchayati raj systems into line with the new constitutional amendment.

II

The journalists argue that their conditions of employment make it difficult for them, and for their counterparts in other regions of India, to serve as a dependable early warning system. Most reporters in northern Karnataka, much of which is prone to droughts and outbreaks of related illness, are stringers for Bangalore newspapers. Stringers receive around Rs 250 per month, which means that they can only give part of their time to the job. The need to commit themselves to other employment makes it difficult for them to move very far or very often outside the district headquarters towns. Since most of them have—at best—a motor scooter for transport and no allowance for hiring other vehicles, their ability to roam widely within their districts (some of which are very large) is further limited.

This seriously undermines their effectiveness at discovering and investigating emerging calamities, most of which arise in rural areas far from the main towns. Even the representatives of the *Deccan Herald/Prajavani* newspaper group, who are proper 'staff reporters' with full-time salaries, have difficulties with transport. Given this and the fact that most publishable stories emerge from the district headquarters, reporters tend only rarely to venture into the remoter parts of their districts.

These journalists also tend not to look beyond the boundaries of their districts, since by doing so, they trespass on the bailiwick of a colleague working for the same newspaper. This causes yet more problems, since the full seriousness of a drought or an outbreak of disease may only become apparent when district borders are crossed. Only one journalist in the whole of northern Karnataka, M Madan Mohan of *The Hindu*, is encouraged to range over more than one district as part of his normal routine. This has made it possible for him to deliver early warnings on several occasions, but he still insists that the press does not provide a satisfactory safeguard against disasters. The editors of other newspapers very occasionally encourage their field representatives to cross district borders, but they also stress the inadequacy of this as a source of early warnings.²

There are of course local papers in most districts, usually in the headquarters towns, but they do little to strengthen the watchfulness of the press. Most of them tend to print revised versions of stories taken from larger papers published in the state capital, together with a few unadventurous local reports. Some exist mainly to extort money from prominent local people, by threatening to publish embarrassing stories about them, but many are too under-informed even to accomplish that. One well-informed source insists that most of the 36 newspapers published in Mysore district lack the resources even to have learned of an event such as the recent atrocity against scheduled caste people in Nanjangud taluk of that district, until they read about it in papers published in Bangalore—and Mysore has a far livelier press than most districts in northern Karnataka.

There are exceptions to this uninspiring picture, local newspapers and reporters that have good enough connections to get wind of a drought or flood or outbreak of disease. But reports on such things in district newspapers tend not to produce action from civil servants at the district level. For that to happen, the stories must appear in papers published in the state capital, since it is there that district-level officials' superiors, who have the power to censure them, sit.

Even when bureaucrats are directly informed by citizens of impending calamities, they do not invariably take quick action. A press report on the recent drought in Malkangiri district of Orissa, for example, stated that an elder from one village in which about 25 families were starving had alerted the authorities early on, but despite this, no official had visited this and neighbouring villages for three months.³ Journalists in northern Karnataka say that to ensure that such alarms receive prompt responses, some means must exist to put political pressure on civil servants. Dreze and Sen have also made this point.

We might expect state legislators to play a role in informing higher authorities about emerging calamities and in pressing for action. But reporters argue forcefully, with abundant illustrative examples, that most MLAs spend too much time outside their constituencies, politicking in the state capital or elsewhere, to do this effectively. These journalists regard themselves as far more dependable watchdogs than legislators.

There was a time, many years ago, when political parties—especially the Congress—had organisations in the districts that were sufficiently strong and penetrative to function well as information-gathering instruments. But the decay that has overtaken the organisations of most political parties in recent times makes it impossible for them to provide much in the way of early warnings. Reporters have even less faith in party workers than in civil servants or legislators.

III

These same reporters argue convincingly that this unhappy state of affairs changed dramatically when strong panchayati raj institutions—zilla parishads and mandal panchayats—existed in Karnataka between 1987 and 1991.

Before the creation of these institutions, the main occasion at which legislators and bureaucrats conferred on conditions in rural areas was the meeting of the district development council, every three months. Information at these meetings mainly flowed in one direction, from the deputy commissioner to the MLAs. The legislators made a few representations which had been passed to them by prominent constituents, but they mostly asked the

DC questions about how things were and what was being done at the grassroots, and he (or occasionally she) would brief them. Reporters who observed these encounters may have doubted the extent of their own understanding of the rural scene, but they knew enough to recognise both that the deputy commissioner's responses were 'cursory' and that most MLAs were too ill-informed to see how inadequate his comments were. One result was that the drought-relief programme in those days existed mainly on paper.

Journalists do not judge the MLAs too harshly for their 'blissful lack of awareness'. Their constituencies are, after all, quite large. A sizeable district like Dharwar, for example, has only 15 legislators with rural constituencies. And long absences in Bangalore (an overnight journey from Dharwar) are an occupational necessity for these MLAs.

When the Panchayati Raj Act came into force, however, things changed. The zilla parishad had 58 elected members, all from rural areas. Since nearly all of them lived in their constituencies, they kept in touch not only with ordinary villagers but with members of the mandal panchayats who in Dharwar district numbered no less than 3,985. (In the entire state, there were 887 elected members of zilla parishads and 55,188 on mandal panchayats.)

With such good information-gathering networks in their much smaller constituencies, zilla parishad members were extremely well-versed on conditions in the villages. The new act gave them sufficient powers and status to encourage them to be assertive in council meetings, which were always well attended and which occurred once each month.⁴ Indeed, they were if anything excessively vocal and critical of alleged administrative failures. Press reports from across the state are littered with references to 'stormy sessions', 'noisy scenes', etc., at these meetings. Hardened journalists in Dharwar district found it 'thrilling' to attend these, not least because of the avalanche of information on grassroots problems that emerged on nearly every occasion.⁵

In these circumstances, civil servants and representatives of Bangalore newspapers learned early and in great detail about water shortages, outbreaks of disease and flooding in rural areas. The formidable powers which members and elected presidents of the zilla parishads enjoyed gave them the clout to pressure bureaucrats into prompt action, and inspired in them a willingness to badger reluctant officials until something was done. On those rare occasions when a president was slow to respond to reports of distress, the strong presence of opposition party representatives on the zilla parishad (and it mattered not whether it was Janata Dal or Congress(I)) guaranteed that he too would be hounded into action. MLAs and sometimes MPs

(all of whom were non-voting members) attended monthly zilla parishad meetings, and every three months meetings were attended by a state government minister, so that detailed information easily found its way to Bangalore, even if it was omitted from press reports.

It is not surprising, then, that mofussil journalists regard strong panchayati raj institutions not only as a virtually foolproof source of early warnings about potential calamities, but as an effective means of ensuring that such warnings do not go unheeded.

These journalists have, however, issued their own early warning about the future of panchayati raj institutions now that the new constitutional amendment has come into force. They insist that these institutions will only be effective at raising the alarm about drought, epidemics, flooding and the like if elected members are given enough powers over bureaucrats and spending to energise them. If state-level politicians, who are naturally reluctant to erode their own influence, do not extend significant power to these bodies under the laws now being revised, then panchayat members will become demoralised and passive. Early warnings will not emerge from such people. The cost in human terms, when avoidable calamities strike rural communities, will be high.

Notes

- 1 See for example, J Dreze and A Sen, *Hunger and Public Action* (Oxford, 1989), Chapter five; J Dreze and A Sen (eds), *The Political Economy of Hunger*, Volume two, *Famine Prevention* (Oxford, 1990), especially Chapters two and three, by Dreze.
- 2 I am especially grateful to M Madan Mohan of *The Hindu*, Hubli; E Raghavan, associate editor of *The Times of India*, Bangalore; M Ahiraj, *The Times of India*, Hubli; and M B Maramkal, *The Times of India*, Mysore and formerly Gulbarga, for information on these matters, provided in interviews in April 1993.
- 3 UNI report, published in various newspapers on April 7, 1993.
- 4 In addition, each zilla parishad had nine standing committees which met each month, and considerable information on grassroots problems emerged there too. The press was not invited to these meetings, as it was to zilla parishad plenary sessions, but news of the proceedings was often passed to reporters by members who wanted their views aired more widely.
- 5 These comments are based on discussions with dozens of former presidents and members of zilla parishads, district-level bureaucrats and journalists, in Dharwar, Mysore, Uttara Kannada, Mandya, Bangalore and Kolar districts. The quotation comes from an interview with M Madan Mohan, Hubli, April 5, 1993.

Face of Dowry in Orissa

Biswamoy Pati

The demand for dowry and the harassment of married women by their husbands and in-laws is a multi-caste and multi-religious phenomenon in Orissa. Only a strong women's movement can counter this widespread social practice.

VERY few people realise how violent Oriya society is vis-a-vis women. This is something that can be easily proved statistically with the state topping in dowry-deaths which have increased from two to 63 in the 1987-91 period. Incidents of rape have similarly increased from 184 to 285 by 54.9 per cent in this period. There has also been a decline of the female population in the decade 1981-91. Thus, the male:female ratio which was 1,000:981 in 1981 has gone down to 1,000:971 in 1991.

One reads and hears a lot about the kerosene stove 'accidents'—which have assumed alarming proportions since the 1980s—resulting in the deaths of women, as well as of the terror inflicted on them in order to extract dowry from their parents after their marriage. In this piece we focus mostly on those who have survived—given a discourse which allows the 'golden egg-laying hen' to live—and one case of bride-burning. What we present are oral testimonies brought before the

Utkala Mahila Samiti. They shatter patriarchal myths which seek to situate dowry as a girl's share of parental property, or as a daughter's life insurance policy secured by her parents at the time of her marriage. The case of bride-burning we cite is based on a local newspaper report (*Sun Times*, November 28, 1992). It relates to a Muslim girl and her husband and demonstrates the multi-religious nature of this phenomenon.

Case 1: Sabita Samal (d/o Narayan Lenka, w/o Rabindra Samal, Patkura, Cuttack district)

When the country celebrated independence day last year (1992), Sabita Samal's day represented a direct antithesis to it. Sabita's father, Narayan Lenka, had got her married in July 1991, paying a dowry of Rs 28,000 in cash. Besides, some gold and silver ornaments and other things worth Rs 48,000 were also given. Narayan Lenka, a fire-constable had to sell off his

land her Sabita's marriage. Sabita's husband, Rabindra Samal, worked at the Bhubaneswar Development Authority (BDA) as a temporary worker. Prafulla Nayak (Rabindra's brother-in-law), an overseer in the BDA, had helped him secure the job. The young bride got caught in a vicious network of dowry and bribery. Her husband began to beat her and abuse her regularly. He took away all her ornaments—after all, Prafulla Nayak had to be 'paid' for securing him a job, and, also to make it permanent. Her parents-in-law never intervened to help Sabita and she had to go through various things, including a session with a witch-doctor.

After a point Sabita could not take it any more. She was forced to escape to 'freedom'. Since her father was posted at Kendrapada, she lived alone in their village. Taking advantage of this her husband, a cousin of his and Prafulla Nayak ransacked their house. They took away Rs 12,000 and Sabita with them. Although this happened in front of the villagers, nobody came to her rescue. Sabita was taken to Prafulla Nayak's residence at Bhubaneswar. Then began her trauma of August 15, 1992.

Sabita was gagged and beaten by Nayak and his two college-going sons. They twisted her arms and broke her hand with a rod. They removed all her ornaments. Nayak's 16-year old daughter also joined in to give Sabita electric shocks. She was forced to sign on a blank piece of paper. Finally, a rod was put on the lower part of her abdomen and the young men stood on it. Sabita bled profusely and lost consciousness. The 'carnival' was at last over. Thinking that she was dead they dumped her at a deserted place about a kilometre away. Late at night it rained and Sabita regained her senses. As she was found shivering by an 'inspection team' from the Nayak household, she was taken to the Bhubaneswar hospital. Here the doctors were told that she had fallen from the roof. Her broken hand was put in plaster and she was discharged.

Sabita's father reached Bhubaneswar when he heard about these events to have a last glimpse of his daughter. Most people in their village were certain that Sabita was dead. At this stage Nayak spread the story that Sabita had stolen eight 'bharis' of gold from their house and had tried to escape with it; that she was mad, etc.

Sabita and her father reached the Sahid Nagar police station and lodged a complaint on August 18, 1992. The inspector, Bijayalaxmi Acharjya accused her and her father of conspiring and suppressing facts, viz, that she had 'misreported' an accident. Ms Acharjya stripped her father of some money he carried in his pocket. Subsequently, she demanded Rs 500 to go to Sabita's and her in-law's village to make enquiries. No police action seems to have been taken till October 12, 1992.

Case II: Chapala Nayak (d/o Kantha Nayak Patkura, w/o Akshaya Behera, Barchana, Cuttack district)

Chapala Nayak was married off for a dowry which included Rs 5,000 in cash and Rs 20,000 in the form of gold ornaments. Akshaya Behera, her husband had a rice business and was subsequently employed as a driver. The dowry was, in fact, handed over during the marriage. Soon after her marriage her in-laws wanted a 'bhara'—a customary gift—for Sabitri 'amabashya' (an eastern Indian parallel of the Karwa Chauth). She was beaten up for this and the 'bhara' was subsequently sent by her parents.

When Chapala was pregnant she was taken back by her father. However, her husband persuaded her to return. They spent some time happily and were blessed with a son. After about two months her husband wanted a TV set from her father. Since she refused to comply she was stripped of all her belongings by her husband. These were sold to buy a TV set.

After this Akshaya seems to have become attracted to another woman and his behaviour vis-a-vis Chapala worsened. She was regularly beaten by her husband and her in-laws. They even tried to give opium to her child and kill him. Once when her husband was away her in-laws beat her mercilessly. Fortunately, the villagers intervened and restrained them.

Chapala's father came over to see her and was persuaded to take her along with him for a month to 'cool' things. Her husband went over to meet her thrice, after which she was conveniently forgotten for a year. Her father had to go over to her in-laws and work out a 'compromise' to send her back. However, when Chapala returned she was kept segregated by her husband and her in-laws and was exposed to systematic terror. With the help of some villagers, Chapala collected a medical certificate to prove that she had been beaten severely. Then she filed a FIR at the Barchana police station. Attempts made by the police to talk to her husband and father-in-law proved to be counter-productive. She was tortured even more. Consequently she was forced to return to her parents. Although more than a year has passed, nothing has happened and, she is too scared to return to the 'hell' she has escaped from. She waits for the day when she will be given a maintenance allowance for herself and her child.

Case III: Namita Swain (d/o Padmacharan Swain, w/o Narendranath Swain, Cuttack district)

Namita was married off on June 30, 1988. Her father, a 'petty worker' in the Cuttack Medical College raised a huge amount, which was given over as dowry. This included Rs 15,000 in cash, five 'tolas' of gold and Rs 50,000 in the form of gifts.

Soon after marriage, Namita's husband 'discovered' that she was 'ugly' and 'dark'. She was told that he had married the dowry not her. Namita was asked to get another Rs 50,000 and tortured for some time. After this her father-in-law took her to Cuttack (July 16, 1988) and left her there asking her to return with Rs 50,000. It was impossible for Namita's father to raise the money. At this juncture her husband wrote a letter to her father in which he threatened to burn her.

After a year a few relatives of her husband came to Cuttack. They asked Namita to go immediately to her husband who was reported to be very ill. Namita reached her husband's place, only to realise that this was a lie. She was asked if she had brought the money with her. She told them that given her father's critical financial position he was in no condition to raise the money. She was tortured for her failure and her father-in-law repeated the earlier ritual of taking her and leaving her at Cuttack, and, asking her to return, if at all, with the money.

On September 7, 1991 Namita heard that her husband had married for the second time. She has since gone to court and waits for a maintenance allowance.

Case IV: Priyambada Mishra (d/o Gyaneshwar Rath, w/o Shibashankar Mishra, Puri district)

Priyambada was married on September 24, 1992. Her husband was posted at Bangalore. Theirs was a small family and consisted of her mother-in-law and her two sons. Her mother-in-law got a pension, since her late father-in-law had been a government servant. These features proved to be 'attractive' to Priyambada's parents. The dowry demand included Rs 40,000, a scooter, TV set and five bharis of gold. Four bharis of gold, Rs 13,000 in cash, 10 bharis of silver and certain other things were given.

After her marriage these things were forcibly taken away from Priyambada. When she reached Bangalore she realised that her husband was a driver of transport vehicles, not a supervisor in a bank, as had been claimed before their marriage. Her neighbours at Bangalore were very kind to her and it was from them that she learnt that her husband planned to murder her. In fact, they advised her to go back to her parents.

Priyambada returned home with her father and her brother who had gone to visit her. Sometime after this she delivered a baby. When her brother informed her mother-in-law about this she was very abusive and packed him off saying that this was not possible as her son had not been married in the first place. Soon after she rented out their house and went away. In the meanwhile Priyambada's husband was transferred to Hyderabad.

When Priyambada reached Nayagarh with her parents and her brother and

'bund tenants at her in-laws' place, they decided to stay on. While staying there, the local chairman's wife came over to meet her. She tried to poison her child and left after abusing and threatening her. She returned the next day with goondas and Priyambada's brother-in-law. They broke into the house and manhandled Priyambada and her father. Priyambada and her father filed a FIR at the Nayagarh police station. They have also met the chief minister of Orissa. At present both Priyambada and her child live with her parents waiting for justice.

Case V: Anima Das (d/o Panchkoti Pati, Bhubaneswar, w/o Ashok Das, Cuttack)

Anima was married to Ashok Das on January 26, 1989. Before her marriage Ashok's parents had wanted a scooter, a TV set and a refrigerator as dowry. Anima's uncle had flatly refused this as her father (a retired government servant) was in no position to meet this demand. In fact, he had even told them to cancel the marriage proposal if they were serious about the dowry. Anima's would-be in-laws seem to have changed their position and the marriage was solemnised at Bhubaneswar.

After Anima reached Rourkela (where her in-laws resided) her mother-in-law began comparing the dowry brought by Ashok's brother's wife. She was abused and ill-treated by her husband and her in-laws. Ashok left for Cuttack where he taught at a school and Anima stayed on, being reduced to a 'maid' of the household. One day she was beaten severely and had a swollen hand. She went over to her uncle who was a doctor for help. When her uncle and aunt went to drop her back in the evening, her in-laws were not prepared to accept her. After a lot of persuasion they were made to change their minds. In the meantime Anima's parents were traumatised by the treatment meted out to her, the news of which reached them at Bhubaneswar. Before she left Rourkela for Bhubaneswar her in-laws took away all her ornaments and her saris. After this her parents decided to send her to her husband at Cuttack. He did not approve of this and, subsequently, she was accompanied by her sisters and a cousin, who went over to Ashok's place. The underlying belief was that, perhaps, without her in-laws' presence the marriage would work. Her two sisters camped with Anima for a few days. In course of this he abused everyone. Anima's in-laws came over and she was beaten, abused and kept segregated in a semi-starved state.

Realising that the attempt was futile, Anima rejoined her parents. She now waits for a home and justice.

Case VI: Farida Khatun (d/o Mohammad Ayub, Kendrapada, Cuttack district, w/o Abdul Jani, Keonjhar district)

Farida was married to Abdul Jani in 1986. Her father had given Rs 10,000 in

cash and five tolas of gold as dowry. Subsequently, she mothered three children. At first she was tortured for not bringing furniture. Soon after her father sent a furniture set. Farida was next tortured for a motorcycle. Her father had agreed to this as well. However, unable to bear the torture she decided to leave for her parent's place on November 8, 1992.

As she waited at the Keonjhar bus stand, her brother-in-law arrived there and whisked away her children. Farida was forced to return to get her children back. When she reached there, her husband and her brother-in-law doused her with kerosene and set her on fire. She was then taken to the local hospital where her husband declared that she had got burnt due to the accidental explosion of their kerosene stove. Farida was shifted to the Cuttack hospital by her father and her uncle. In a dying statement she accused her husband and her brother-in-law of setting her on fire. Farida's father has met the Orissa chief minister, the police DG, several ministers and officials. Can they punish the guilty?

Certain things emerge from what we have narrated. Dowry demand and harassment have a multi-caste basis—viz, khadayat, karana and brahmin women suffer as its victims. However, one needs to go in for intensive research to see how far this menace has touched the tribals and the outcastes. Moreover, although two of the victims belong to Nayagarh (an ex-princely state) in the Puri district and Keonjhar district (an ex-princely state), one needs to look into the western tract as well.

As seen, this problem transcends the rural/urban dichotomy. Although the victims are mostly from the lower middle class, one should not locate it as a phenomenon of this class alone. It is very possible that middle class victims, as well as the poorer sections do not report such cases—fearing social stigma or because of the lack of knowledge about the legal process, respectively—unless the level of terror and violence becomes a threat to the lives of the victims, or in the event of their death.

What we also witness is that it is a multi-religious phenomenon. The last case we have cited relates to a Muslim woman and her husband. Similarly, the ease with which Hindu husbands can re-marry after harassing their first wife for dowry and without any formal divorce is demonstrated in one case we have cited.

It is indeed unfortunate that most of the victims have been 'married off' in line with patriarchal notions of 'responsibility' by their parents without any attempt to educate them, or make them stand on their own feet. This, coupled with a general neglect of a girl's education/career moulds victims to a stereotyped role associated with reproduction and 'wifely' responsibilities. As seen in one case, this reduces them to the position of unpaid

maids, velling a structure of exploitation associated with household labour.

One also sees an attempt to draw upon traditions, like the Sabitri amabashya, in order to legitimise predatory demands. This co-exists with a lumpenised perception which commodifies marriage and converts a sacred act into a materialist exchange. The inherent logic of competitiveness and its association with consumerism (viz, TV sets) is obvious.

The amount of money raised for dowry by some parents is disproportionate to their income. This has serious implications. As seen, they are forced to sell their land, etc, to meet dowry demands. Moreover, there is a possibility of this pressure pushing them towards corruption. Besides, the nexus between dowry harassment, bribery and unemployment, as seen in one case, needs to be highlighted.

The structure of acceptance enjoyed by dowry is significant. This perhaps explains why some of the victims were not helped by co-villagers. In the case of Chapala Nayak, 'help' was extended and a feast extracted from the victim's father by the village panchayat. Besides, help and sympathy for the victims of dowry blurs gender-based distinctions. The behaviour of the women in the family (viz, mothers-in-law and female relatives), in the locality (viz, the local chairman's wife) and at the police station (viz, the woman police inspector) reveals this most unambiguously. And, going by the record of the police and the time taken by the judiciary, one can definitely argue that both need a thorough restructuring.

Things are perhaps made more difficult owing to the absence of women's groups or a women's movement in most parts of Orissa. The absence of any co-ordination among the few groups that exist also adds to the problems. Nevertheless, the fact that the victims/their relatives do report cases to the police/women's groups, as well as the help extended by ordinary people offers possibilities which cannot be ignored by anyone who wishes to combat this menace.

[The author gratefully acknowledges the help extended to him by the Utkala Mahila Samiti (Cuttack) which includes permission to use the tapes containing the interviews with some of the victims as well as the written complaints received from them.]

Mitterrandism and the SPF

On the Edge of Doom

Frederic F Clairmont

There are many interrelated facets that have gone into the disintegration of the Socialist Party in France, but the primordial catalyst remains soaring mass unemployment.

I

THE magnum's suicide bullet that pulverised the brains of Pierre Bérégovoy, scapegoat extraordinary, France's former prime minister, signalled the end of an aged, forlorn, mentally destabilised and battered politico. His personal ambitions had been ground into the dust by the electoral tornado of March 26 that swept into limbo the Mitterrandist monarchy, and the motley refuse of the socialist party.

Symbolically, in a wider frame, it exploded the pretension that France was a major world power. No less portentous was that it simultaneously shattered the morsel of mendacity that the socialist party of France (SPF), shuddering in a state of apoplexy and moral decadence, was an instrument of democratic change.

When Bérégovoy was shovelled into the first minister's job by Mitterrand, he plunged into it with the resounding and ecstatic adman's battle cry that he was the man of the hour, one of whose principled goals was "to lance the abscess of corruption". By then, the moralising babble touted by the SPF and their servant sounded hollow. It was one more banal sop of verbal overkill to which the people of France had been subjected to by one mob of ministerial fly-by-night hustlers after another in rapid succession.

II

True to form Bérégovoy was importent to change anything. He wasn't meant to. He was a stage-managed front man. The ruling political class used him as a scapegoat; as a fragile, frantic man gripped in the coils of gutter politics he proved to be an ideal gadget wielded by the master of the Elysee Palace. The financial and other scandals—better still crimes—did not ebb; they rocketed on the immutable trajectory to heights exponential.

The interest-free loan of \$2,000,000 that Bérégovoy had acquired through the largesse of a notorious racketeer convicted of insider trading was suggestive of the fragrance of the kickbacks and skulduggery. It was peanuts, of course, compared to the torrential cash flows that irrigated the soil of the SPF and other political agents. Was Bérégovoy so dumb as to

believe that there were no trade-offs for such delectable interest-free offerings?

Heaven's manna flowed smoothly and uninterruptedly into the bottomless moneybags of the political caste who demonstrated, in the poignant phrase of John F Kennedy, their reluctance to "resist the pressure of opportunity". But this big-time racketeer and political pimp was by no means a solitary swallow. He epitomised a vast proliferating species of profiteers incubated by the binges of economic liberalism—one of the ideological keystones of the Mitterrandist arch.

This burgeoning profitariat and other parvenus know the value of the SPF and coupled their loot to the get-rich-quick culture of the political caste. The cause of the death of Bérégovoy's financial benefactor remains mysterious but it is of minor relevance. More pertinent in understanding the SPF's twisted anatomy is the symbiosis between them. In such fertile earth, how is it to be expected that the racketeers would not become the object of unctuous solicitation by all constituents of the French political chattering classes?

III

The hoary spectacle that we are witnessing within the SPF's ranks is the stench and rattle of death. Mitterrand, his cronies and their racketeering fellow-travellers built the sewer, to be sure, with exquisite camouflage, interminable badinage and cover-ups, into which they themselves have now plunged. In so doing as a death wish—and to the dishonour of France—they have shoved the nation into the cesspool as well.

Bérégovoy's self-liquidation coming in the wake of the SPF's cynical, corrupt and ignoble reign gripped the nation not because of the media's claims that it marked the departure of a supposedly benign soul, but because it unravelled in a moment of apocalyptic truth all the pestiferous contradictions that had been fleshing the party's vitals over several decades, but which had only brazenly scaled such vile summits over the last decade.

There are many interrelated facets that have gone into the disintegration of the SPF; but unquestionably the primordial

catalyst remains soaring mass unemployment given by the Mitterrandist propaganda machine at 11 per cent or around 3 million. This was a barefaced fabrication. The latest official data highlights that the number is close to 4 million. As in the US, the number was a grotesque undercount. This is not fortuitous as older workers, women, the Arabs, the Blacks and other marginalised youth in the inner city ghettos were deliberately scrubbed from the unemployment rolls.

As over vast tracts of east Europe, the 'socialist' government and its 'socialist' president had become wholly alienated from the sensibilities and hardships of the French whose living standards had plummeted—a process that once again bore striking kinship to what was going on in the US since the onset of the 80s. Precisely because the same causes engendered the same results. In reality there were trivial economic policy divergences, if any, between Reaganism/Thatcherism and the votaries of Mitterrandism, explicitly in its egregiously repressive Rocardian guise.

This spiralling impoverishment stemming from an overdose of austerity packages and repressive economic policies impacted with striking severity not only the working class, but the more vociferous and articulate middle class. Mitterrand and his successive front men: Rocard, Fabius, Cresson and Bérégovoy had become progressively impotent as the 80s switched into the stricken 90s.

The elections of March 21 and 28 are milestones in the annals of French political history. The sheer magnitude of the legislative landslide had no precedent in this or any other century. The aged and broken Mitterrand (78), afflicted with prostate cancer, is wholly isolated; faced with a right wing government with long teeth and sharp memories that despises him. It is ready to give him the chop if he shows the slightest signs of being obstreperous, and he knows it.

This ravenous impulse to settle scores may at first appear paradoxical coming from a master political handler that propelled Big Capital into its present state of exalted profits and euphoria. It ought not to be forgotten, however, that the essence of Mitterrandism—of course never openly avowed—was the elimination of all shoots of authentic militancy that called for a halt to the ravages of untrammelled economic liberalism.

It was for this reason that he and his last prime minister were showered with extravagant encomiums by the *Wall Street Journal*, the *New York Times*, the privatisers and liberalisers of the chambers of commerce and the state department. Likewise, on the foreign policy front, the SPF and Mitterrand himself (with the noble exception of Chevenement who quit

PROJECTED 1993 REAL GDP IN LEADING
EC ECONOMIES, IN PER CENT

Source: IMF

the defence ministry over the Gulf War) proved to be the most obsequious acolyte of the Bushbaker war machine. In addition, the so-called 'right of humanitarian intervention' synonymous with imperialist onslaughts on the third world peoples was spawned by Beregovoy's cabinet. In this respect, Mitterrand was *par excellence* one of the moving spirits that contributed to transform the US security into the cozy white man's club of four.

His critics conferred on him the sobriquet of the Florentine in honour of Nicolo Machiavelli, the renaissance political theorist, that exalted the double-cross as the acme of political craftsmanship. Mitterrand had been psychologically blasted and traumatised by the unrelenting tidal waves of the economic depression. But this time the juice of life was pouring out of him like a rotten barrel replete with holes. His facile utterances had lost all semblance of coherence. His tide had ebbed, never to return.

He had lost his grip on the executive. He was also powerless even to influence the march of events within the rat-ridden socialist party that had become a derelict wreck, victim of the once lush pickings by the career political racketeers. The SPF, political debacle was the end of the road. The SPF exhibited total psychic exhaustion towards the end but for Mitterrand and the distraught party leadership it must be seen as a respite and a deliverance.

Just as Houdini, the grand magician, was said to be able to wiggle out of all chains Mitterrand was reputed to be able to talk himself out of a coffin by his rhetorical baloney. The political Houdini is dead. Broken promises, lies and bigger lies, trailed by the most sordid rationalisations were the permanent agendas of the 'socialist' government. But this time round the monarch's magic did not, and could not, do the trick.

Mass unemployment was and is merely the tangible scourge of France but it was not the only one that punched the soft underbelly of the executive and the legislative branches of government and the

SPF. The economy has ground to a halt and there is no short-term prospects of recovery. Racism over the last decade, as any perfunctory visitor to the big cities bears witness to, had become rampant. But the reigning caste failed calamitously to dam the deluge.

IV

Compounding the blight of racism, stagnation and mass unemployment was the pervasive embezzlement that had seeped into the very marrow of the public and private sector. Only the tip of the iceberg, a very small tip, was revealed. The criminals that were shoe-horned into prison were the small fry. This is one of the differences between Italy and France where the judiciary, particularly in Milan, is hell-bent on bringing the criminals to book.

As in all the moribund advanced capitalist countries, the gap between the rich and the poor had grown horrendously wide. Never in the history of France, save perhaps in the years of the Second Empire in the 1860s, had the rich so ostentatiously flouted their wealth.

This was the providential boon on Mitterrandism to the bourgeoisie and for which he will not be forgotten; it was a deliberate act of policy fuelled by privatisation and the concomitant disaster of economic liberalisation. This came straight from the kitchen of the SPF, and owed nothing to the deviousness of the World Bank and the IMF.

The essence of the 'consensus politics' notably galvanised by the Rocardian wing of the party was blueprinted to enhance the powers of Big Capital. A dazzling success story galvanised at the expense of the middle and working classes. To dissimulate the violence of domestic policies and hence deflect attention from the tribulations of daily life Mitterrand's strategy was to market the 'human rights' issue with immense public relations ballyhoo of which they had become past-masters.

The peddling of the 'human rights' merchandise which Mitterrand hoped to cash in on with a Nobel peace prize was a gigantic gimmick and a fraud perpetuated for internal domestic purposes. It did swindle some people, but there were others that could not ignore Mitterrand's unequivocal historical record. True Mitterrand was a prisoner of war but his role in the resistance was marginal. There were those that had not forgotten that the mumbling Mitterrand was not to be numbered among those that opposed actively in the post-liberation years colonial genocide in Indochina and Algeria. In-

deed, successive socialist governments notably, those of Guy Mollet, were among the most ferocious protagonists of mass genocide in Madagascar, Indochina and North Africa.

The French constitutional apparatus is a hybrid mechanism created by the political caste-class to perpetuate survival; it is neither a presidential nor a parliamentary system. The executive is elected for seven years and the legislative assembly for five years with overlapping and conflicting jurisdictions. The constitution is itself a rigged contraption confirmed in the electoral results. The official political 'right' with less than 39 per cent of the vote grabbed over 80 per cent of the seats in the National Assembly.

The constitution is a perpetual scissors-and-paste job, remoulded several times to meet the imperatives of the political caste. Big Capital's interests have never been jeopardised by these dirty little games. True, Mitterrand and the SPF strenuously sought to annihilate the distinction between left and right, but Big Capital has generally preferred its authentic servitors incarnated in Giscard d'Estaing, Chirac and Balladur to turncoats. But this is not always so.

The SPF was, and is, required at specific historical junctures when massive organised working class agitation looms ominously. As with Thatcher's stratagems, the goal has been to dismantle and demoralise working class institutions, notably the trade union movement.

The SPF, in contrast to Tory policies, was only partially successful in achieving this goal. It remains for Balladur and the trusted goons of the political right to complete the job. However, there is no automatic guarantee that working class resistance can be so easily demolished or its leadership irrevocably corrupted, even with the support of the perversely concentrated press and television media.

Certainly the people of France witnessed not only what was happening within the SPF but also the decomposition of the Spanish socialist party of Felipe Gonzalez. As in France the country was, and is, rocked by every imaginable ruse of petty and big-time racketeering within and outside the party. There joblessness has already outstripped one-fifth of the labour force and is rising with little or no prospects of receding.

Likewise, the omnivorous and omnipresent corruption and scandals in Italy that had been brutally exposed—the process has not yet run its course—dramatised amongst many other things, the dimension of the personal corruption of the socialist prime minister Bettino Craxi. The canker has engulfed the party's entire apparatus.

The decay of European social democracy is an audible and visibly blinding

entity, one which Mitterrand grudgingly acknowledges in private. More crucial in the shaping of public opinion was the mess and muddle within the SPF that reared its head prior to the elections for the party's new leadership.

The formal ideological currents, so typical of SPF politicking, bears the names of the leading prize fighters—Rocardians, Fabiusens, Jospinists and others—who have thrown their caps in the ring. It is not that there is much ado about nothing but that there is much ado about very little. In fact, there is little difference between them. Chevenement, a man of integrity, was honest enough to call a spade a spade when he thundered that he no longer had a place in the party because it had ceased to have any moral principles. He was wrong. Rooted in the most opportunistic strata of the *petit bourgeoisie* the SPF never had any moral principles to start with.

But the story and the party's fate was to have one more macabre twist. On the eve of the legislative elections Michel Rocard with great fanfare proclaimed that the party had no *raison d'être*; it was therefore mandatory that it should scrub its name and shed its past. The medicine prescribed was that it should be reorganised on the lines of the Democratic Party in the US. In so doing he had once again made his genuflections to the political right and affirmed his respectability. The Clinton administration and its party had become his model and his mentor. He was not joking when he called this the 'Big Bang'. It was a ragbag destined to corral a miscellany of disaffected elements of all parties.

It was cheap baloney to begin with but Rocard made his spiel. It was a flop. Poor Rocard, former prime minister who had employed, at what price has not been disclosed, Clinton advisers to mastermind his campaign, lost his seat in the National Assembly. Far more comic and farcical was that the same Rocard who called for the Big Bang, that is the party's dissolution, fought for the leadership of the party and won the coveted prize.

Such is the present disarray of the party's fortunes, or rather misfortune, in a stage of decomposition. The final word belongs to a Parisian militant that toiled for his party for over 20 years:

I've never seen anything like the current party congress that elected Rocard. The militants had no say. The cussed business was stage-managed with the most blatant and vulgar American marketing techniques. Don't talk to me about democracy here. If only it were a farce that wouldn't be so painful; but it's more than that; it's crooked. I no longer want a place in that outfit. And there are hundreds of militants at the grassroots level like myself. It's as simple and tragic as that.

The disarray within the party could not be more pathetically portrayed.

Indian Institute of Advanced Study

RASHTRAPATI NIVAS, SHIMLA - 171005

Advertisement No. 3/93

1. Applications on prescribed form are invited for award of Fellowships for the academic session commencing from August 1, 1994 from scholars holding Ph.D degree who have experience of independent research at advanced level, in the following areas.
Humanities: (i) Art and Aesthetics; (ii) Comparative Study of Literature; (iii) Religious Studies with emphasis on Comparative Studies; and (iv) Philosophy.
Social Sciences: (i) Development Studies; (ii) Comparative Study of Political Institutions; and (iii) Socio-Economic and Socio-Cultural Formation in Historical Perspective.
Natural and Life Sciences: (i) State Policies on Science and Technology; (ii) Science, Technology and Development; and (iii) Methodologies and Techniques.
2. A few Fellowships may be awarded for projects of exceptional interest even outside these areas and also to eminent scholars not necessarily possessing research degrees.
3. About two-thirds of the Fellowships will be earmarked for those who are already working in Universities, Research Institutions or other responsible positions. Preference is given to those who have already done considerable work on their projects and wish to avail of the facilities at the IIAS to complete their work. The Institute does not encourage studies which involve field work.
4. The selection of Fellows will not be restricted to those who respond to this advertisement. The Institute has the discretion to select Fellows in other ways as well.
5. The detail of the amount of Fellowship grant payable to Fellows will be supplied along with the application form.
6. The term of Fellowship ranges from three months to two years, depending upon the nature of the project, and only in exceptional circumstances can it be extended further up to a maximum of one year.
7. Residence at the Institute is compulsory from April to November, and optional from December to March. All Fellows are provided free hard-furnished accommodation on the campus as well as secretarial assistance.
8. The prescribed application form may be obtained from the Deputy Secretary (Administration) of the Institute by sending a self-addressed envelope (25 cm × 10 cm) or personally from the Institute by June 30, 1993. The completed application forms should reach the Institute latest by July 15, 1993. In the case of candidates living abroad, applications will be accepted up to July 31, 1993. Those in service should apply through proper channel.

BROTHERS AND SISTERS: ISN'T IT TIME WE FOUGHT FOR EACH OTHER?

We, people of Indian origin living abroad, wish to express our deep anguish over the vengeful destruction of the Babri Masjid at Ayodhya and the wanton killing of hundreds of innocent lives in Bombay and Surat, which created a vortex of violence that culminated in the tragic and equally deplorable bomb blasts in the city of Bombay on March 12.

By conspiring to destroy the mosque, the right-wing extremist Hindu organisations—BJP, VHP, RSS, Bajrang Dal and Shiv Sena—showed utter contempt for India's Supreme Court, its Constitution, for political decency and public morality.

These forces threaten the country's pluralistic-democratic and secular order and violate the tolerance that is supposed to be at the core of Hindu faith. To this day, they continue to pursue their anti-democratic "Hindu Rashtra" agenda and cynically manipulate the temple issue, signifying an appalling growth of fascistic forces. These forces have created a communalised atmosphere in which fanatics of all hues thrive.

What is happening in India is not an issue of Hindus versus Muslims or Hindus versus non-Hindus. It is a struggle between the forces of fascism and bigotry on the one hand and those of democracy and secularism on the other

It is particularly alarming that the State machinery connived in the mosque's destruction and repeatedly failed to protect citizens' life and property in the violence that followed. The anti-minority pogrom in January in Bombay and the cycle of violence unleashed point to the serious dangers that lie ahead.

We appreciate the fact that these acts have been strongly condemned by the mainstream of Indian society, including the vast majority of Hindus. But we deplore the Central Government for its failure to prevent the destruction of the mosque and its decision to allow BJP supporters to offer prayers at an illegally constructed platform on the same site in Ayodhya.

We take pride in the multi-religious, multi-cultural traditions of Indian society. We believe that India belongs to all its citizens and it is imperative to restore public confidence and ensure that all communities can live with dignity and self-respect.

We resolve to extend our support to the re-creation of this confidence.

Fragile Mega-Worlds After the Sacrifice

Peggy Mohan

There is a pattern that keeps recurring as we trace the movements of 20th century man up from small social groupings into megasystems. At one level, it has involved technological intervention into small functioning systems. At another, it has also resulted in qualitative change. And inevitably, this qualitative transformation has had far-reaching consequences in the domain of social justice.

"...and what", I asked, "is the biggest reason people are safe on the roads?" The little girl thought, laterally, and answered me: "because nobody really wants to hurt us."

IMAGINE, for a moment, a topsy-turvy world, in which every driver, in fun or in malice, wished to hit you as you walked down the street. Where every adult had plans to kidnap your child. Where every stray dog was actually out to bite you. Now try to imagine the systems you would have to design to protect yourself from this constant level of danger—and how very often your best systems would fail at protecting you.

Thought experiments like this bring home to us how much we depend on the inbuilt nature of human beings, rather than the power of official enforcement systems, for our basic security. So it was in the beginning, when we lived in small social groups, never really analysing all the forces interacting to create order and stability in our lives. And so it is now, even as we narcissistically give ourselves full credit for creating the systems which, we believe, bring law and organisation to our lives.

There is a pattern that keeps recurring as we trace the movements of 20th century man up from small social groupings into megasystems. At one level, this pattern has involved technological intervention into small functioning systems with the narrow aim of maximising something quantitative about them, and these interventions have resulted in new kinds of structures, more dependent on man's control. Big agriculture. Mass media. The world market. Large plural societies operating as nation states.

From another standpoint the transition into megasystems has not been just another quantitative increase. The switch

has been every bit as significant and as qualitative as if it were from an 'analogue' mode to a 'digital' mode. And, as with the transition from the analog to the digital, man moved beyond his natural in-built capacity for 'andaza' which had kept him on track ever since eternity. The scale of things now exceeded the bounds of our genetically guided competence. We were now in a brave new world!

The big mistake, however, was our thinking that all of existence necessarily obeyed the same natural laws we had been familiar with in the small-scale low-energy worlds we began from. But even in those small systems our understanding of natural laws had had been largely intuitive, and without any real analytical depth. So it was easy for us to jump to the narcissistic conclusion that we were the ones whose design and effort maintained the balance in our social groupings, discounting the awesome role of the self-regulating environment, and our own unconscious inner programming, and to go one step further. If we were the ones whose efforts kept things in order, all we

had to do was to 'speed them up' for things to be 'better'. And a great 'divorce' took shape around this mythology: man became, more formally, an "individual", distinct from his social group and his interacting environment. Man could stand alone, with quantitative resources at his command: money, and power. All had broken free of their primary context and attained a separate existence. The pieces were now free to move: the game could begin!

And, inevitably, this qualitative transformation that started out as a quantitative tinkering had far-reaching consequences in the domain of social justice, as face-to-face organic systems gave way to impersonal abstraction. It was 'profitable' to begin growing sugar, the quintessential nutritional analogue of granulated 'energy', and to turn whole island colonies into vast sugar plantations utilising slave labour, and this in turn rationalised the genocide of a whole indigenous people and the most dehumanising enslavement ever seen on this planet. It was 'productive' and 'capital-creating' to manufacture on a mass scale, and so the factory assembly-line, which mocked at ordinary man's urge for creation, was born and made the lynchpin of the industrial age.

The name of the game was accumulation. To make those great mountains of capital they had to leave deep and desolate gorges all over the landscape. The great mass of humanity began to fall by the wayside, and become invisible as they relived in their minds an older world of natural justice.

And man-made rules followed this disassociated thinking. Megasystems demanded the kind of impartiality that would decontextualise events, the kind of

justice that would become a world unto itself, insulated. Safe from localised bias, but blind to the intuitions that had guided face-to-face justice, and ensured that things remained in balance. What emerged out of the magnitude of the new system, and its insulation from localised ground realities, was the grace period of a 'float-phase'—a period of time during which the consequences of high-level decision would remain below our threshold of perception. Deprived of visibility, some adverse consequences might even vanish. It happened often enough to sustain the belief that high-level objectives might be met without social cost, or before the social "bill" could be presented in unequivocal terms. What resulted, under the protective umbrella of the megasystem, was the knowledge that gross infringements of natural humane forms of behaviour could be justified in terms of the logic of the larger system, and the realisation that act was now a thing divorced from consequence, maybe forever.

To pose all this in psycho-social terms, what we had, now, was no longer a collection of bad-minded individuals taking liberties with the rights of other individuals. Oh no! What had finally come true was a Frankenstein dream: the megasystem, growing bit by bit as we 'fed' it, had finally emerged from its quiescent gestation and awoken to its own individual life. People, and events, could now more 'productively' be viewed as statistical probabilities, and as outcomes of forces interacting within a living system. Even leaders would now be largely the upshots of the logical flow of the system. We were all less free than ever before, but mostly we were happy, and hopeful. The divorce from immediate consequence had had its effect in the domain of positive social expectation. Man had learned to keep his eye on the future, and to wait.

Balance was gone, but the structure stood tall, safe and unconcerned. This it could do in two interesting ways. 'Spatially' speaking, the structure now worked according to the laws of thermodynamics as a 'living' system, far-from-equilibrium, sustained by the vast amounts of energy that flowed through it. It had become a living 'dissipative structure': like the Sun, like a whirlpool, like a living person. And 'temporally', the structure achieved a potential balance by borrowing against the future, by discounting consequence. In other words, if the model was right, the megasystem would need a vast and continuous supply of energy to 'feed' it, and it would owe heavy debts which it would one day be called upon to settle.

This is a classic 'phase transition' situation, where a linear process of incremental growth gives way to a fundamentally

new landscape on a different plane of energy. In phase transition what we do is 'cross the threshold' into another 'phase' of existence, where suddenly the old laws no longer apply. One such moment in time came when physicists, happy in a world 'almost-described' by Newton, turned their attention to 'hyper-real' phenomena at the speed of light out in the free-floating cosmos or down in the particle zoo. As Newtonian laws broke down in 'hyper-real' space-time, Einstein made the mental leap to a concept of structure in which the speed of light—and not human-seen matter, space or time—was the central constant. Crucial to this new vision was man's utter relegation to the status of a variable: this submission was essential to the laws of phase transition upward from human-felt reality to hyper-reality. Upward phase transition meant migrating into a system whose worldview was intrinsically at odds with the genetic programming that underlies human perception.

It is a very short step from a system at odds with the interests of the individual to a system under stress turning hostile to individuals within it whom it finds inconvenient. And for its own protection the system forms, out of its human components, apparatuses for regulating itself. The objective is to keep order by suppressing or eliminating 'fluctuations' while the system carries out its own work. When times are good, and the system is 'unexcited', this work takes the form of 'service' to the other human beings within the system, and is essentially a benevolent force maintaining a stable order. But under stress the system's imperatives change, and the job becomes one of exercising power.

There is no use here exploring the various ways in which disturbance can be handled with minimal harm to individuals: the system like any other living thing has an in-built bias. As a high-energy megalith bent upon an in-built course of growth, it prefers to react decisively and without compromise. For this, creatures tuned to 'service' and good relations do not deliver the required result quickly or unequivocally enough. So exit the benevolent state. Leadership turns private and authoritarian. And a new kind of protege-and-hero enters the fray, the kind of individual who is obedient and ruthless. Ideally he should also have no personal opinions, and be perfectly malleable, but these attributes are often incompatible with the power and authority he must exercise. So instead his personal agenda must essentially coincide with that of the system. Enter the warlord.

And so it comes to pass that the most 'advanced' megasystems on the planet are

sustained by the most primitive kind of force. The regulatory sector includes in its ranks various kinds of psychopaths whose talents at restoring control derive from serious personal aberration. The top levels favour 'fronts' who are telegenic and managerial, and uninterested in any major change that would disturb the smooth flow of the system. The most serious change on the horizon is the gravitational pull towards a totalitarian level of control: mass participation becomes something 'irrelevant', 'too time-consuming', and ultimately 'disruptive' to the imperatives of the economic order. The springtime of experiment and of maximising options is over.

The new being we inhabit is a different animal. Since it is essentially quantitative, it is uncomfortable and impatient with qualitative social diversity unlinked to the clean lines of its economic hierarchy. Since it lives at a very high level of energy, it is inherently highly stressed, and these stresses translate downwards as social acrimony and individual tensions along the natural 'fault lines'. As a classic 'dissipative structure' it generates vast 'toxic wastes' of social and individual anger, which float around as a nebulous frustration, seeking interpretation and justification in terms comprehensible at human-felt ground reality. It also generates a more formal 'toxic waste dump' which mirror-images the order in the system, in the form of an organised crime sector. The magnitude of its industrial sector also entails the existence of a shadow world of large-scale production, purchase and stockpiling of armaments. The more sophisticated the structuration in its commercial sector, the larger the proportion of 'empty' and inessential products being generated.

Because of its great distance from natural levels of equilibrium, the system is obsessed with total control, as only a total level of control can seal it off from the forces of entropy which aim at its total disintegration. Because it is 'totalitarian', it 'reconciles' conflict not by consensus, but by choosing and backing the 'strongest' of the contending options, and seeking to absorb or eliminate the others. It is an inscrutable beast, whose intrinsically saltational pattern of evolution gives little warning of the sudden disruptions that 'punctuate' its long periods of outward stability. It is a creature utterly unconcerned with present-day human happiness. Like the awesome dinosaur, or the woolly mammoth, it is perfect, it is an evolutionary dead-end, it is utterly fragile.

'Fragile' is a word that keeps cropping up when we speak of the equatorial rain forests in all their glory. Ever since eter-

nity they have towered over us and intimidated. But now, they stand helpless, and we realise the staggering job it is to prop them up when the responsibility for their survival falls on us. They looked so very safe, as their size insulated them, in time, from the consequences of the liberties we have been taking with them. But what they lack is the gradualistic response we are humanly tuned to expect. One day they seem fine, they can take it all, and more. The next day they are fighting for their lives.

The behaviour of a megasystem when it comes tumbling down is bewildering. It is almost as if the more ambitious it seemed as a 'human' experiment, the more plural the forces it reconciled, the more stable and mature it looked—the more viciously and atavistically it convulses as its lights go out. It calls to mind a smooth spherical balloon, sustained in shape by the pressure of the air in it, air pressure which itself accelerates the rupture once a tiny chink in the order appears. And it explodes in an instant.

It makes one wonder, too, whether there really is anything 'constant' about human beings, even at human-felt reality, since the broad mass of humanity, the 'good' people, swing so wildly in the roles they are capable of playing. One day a loyal soldier of the organisation, obedient and unquestioning—the next day a paranoid killer erupting with personal xenophobia. One day an urbane, cosmopolitan 'yuppie'—the next day a born-again supporter of unfamiliar sectarian beliefs which hold out an offer of personal reassurance in a world full of stress, insecurity and self-doubt. One day a disorganised non-achiever—the next day a stable worker with the patronage of his boss and a smooth uneventful career ahead.

The crucial difference, in the lives of 'good' law-abiding people is system, that large security blanket that organises and decides. This is the true face of the mass of humanity, and their blunt earnestness is what brings the shudder, and the inverted commas around the word 'good'. The ones who understand why we have to kill our neighbours, the ones who proudly send their children to the battlefield to die, the blessed ones who never do anything 'wrong'. After the catastrophe, it is left to the misfits, the 'outsiders', the 'bad' ones, to clean up, and to lead the flock back to a new light.

When catastrophe comes, unfailingly through the internal logic of a system and its pattern of growth we have what is called a catalytic crisis. What is especially beautiful about a catalytic crisis is that it is nature's way of providing a hiatus during which the system and the catastrophe

itself can be analysed, and the other competing options, which were always there but submerged by the success of the system in full swing, explored. The inertia of the megasystem is broken. It is a unique moment that allows for the possibility of reversal!

None of these events happens by human design: the process of 'speciation' of a living system is something far more mysterious and organic, where we have space to function only indirectly in a nurturing role. Our greatest source of authority in 'growing' a better system is the compatibility of our desires with the tendencies of the larger environment, and these, in this moment of crisis, are oriented towards a return to equilibrium, towards reversal. And a reversal of the key features of the system would yield a very familiar list of attributes: plural; low-stress; energy-efficient; balanced; consensual; transparent; happiness-promoting; open-ended. A system that acknowledged error, accepted correction, and learned from its mistakes.

In Buddhist thinking it is mankind's lot to journey from a primal state of grace and unconscious harmony with our natural environment, through a harsh noontime of schism, confrontation and atomised individuality, to reach the evening of our life ready for the paradoxical step of fusion back into our world without losing the insight gained in the experience of individuality. What is striking in this

process is the attention and support given to those souls trying to transit upwards from the state of 'selfishness', as if this phase marked an unworthy immaturity which much be surpassed, if we are ever to become better.

If these models are right, there is nothing inevitable about this particular megasystem as man's final destination. It looks instead like a unsustainable transit-stop where we learn about unhappiness and garner the reductionist skills we might need in the journey ahead. But the onward journey is full of the disruption of reversal, of undoing the groundwork of a whole course of development, of finding a new way.

In his final film, *Sacrifice*, in the shadow of his impending death, Andrei Tarkovsky tells of a world gone so far wrong that the world itself has become 'sinful'. There is no question of trying to seek out and salvage 'good' elements, because they too are upshots of the flawed system, and thus themselves inherently 'sinful'. What is needed is a total cleansing, and a new beginning.

And he ends with the words of a child, watering the same fragile tree his father had been watering at the start of the story, a boy speaking for the first time, in words that echo the beginning of Creation in the Bible, and the Buddhist transition into the world of 'self':

In the beginning was the Word;
why was that so bad, Father?

The Historic Turning-Point A Liberation Anthology

(in 2 volumes)

This Anthology presents a selection of writings from *Liberation* which appeared from November 1967 to early 1972. *Liberation* was the central organ of the All India Coordination Committee of Communist Revolutionaries and then of the CPI(M-L). Almost all AICCCR and CPI(M-L) documents, reports and reviews of struggles and other important writings have been reproduced in this Anthology. It also includes some documents and other writings not published before.

Rich in source material on the history of a stormy period. Edited by Suniti Kumar Ghosh with a group of Associate Editors.

Each volume Rs. 300/- (HB)/Rs. 100/- (PB)

India and the Raj 1919-1947 Glory, Shame and Bondage

Vol. I

"Suniti Kumar Ghosh's remarkable work constitutes a substantial challenge to the reigning schools of 20th century history writing on India"—*The Times of India*, 11 Feb. 1990

To refute the basic premises of conventional historiography, this book relies mainly on primary sources.

Rs. 200/- (HB)/Rs. 70/- (PB)

Biotechnology: Economic and Social Aspects—Issues for Developing Countries by E J DaSilva, C Ratledge and A Sassoon; Cambridge University Press, Cambridge, UK, in association with UNESCO, 1992.

BIOTECHNOLOGY to many is a kind of Aladdin's lamp, promising miracles in productivity and profit, especially for the most depressed sector of the Indian society and economy, agriculture. From cardamoms and orchids to all kinds of fruits and vegetables, from tissue culture and aquaculture to genetically modified plants, biotechnologies seem to offer an arena that would gladden the hearts of any worried about India's economic crisis: tremendous scope for foreign investment on the one hand and the development of profitable exports on the other.

There have also been plenty to sound the warning about the ominous side of biotechnology. The very features that make it attractive to some (a "new buzzword in business", according to an *India Today* article¹) raise hackles in others. Environmentalists have taken the lead in unleashing a full-scale attack on it, seen in such books as Henk Hobbelink's *Biotechnology and the Future of World Agriculture*.² Their critique is radical and at times apocalyptic. Focusing particularly on the biotechnologies of genetic manipulation, they argue that this 'gene revolution' will prove even more destructive to world agriculture than the 'green revolution' was. The green revolution's increase in production in selected crops, the environmentalists point out, was bought at the price of peasants' increasing dependence on industrial-chemical inputs and the spread of agricultural systems that were more vulnerable to disease ravaging monocropped areas, that wiped out genetic diversity and drought resistance, and were actually *less* productive in terms of inputs (whether of fertilisers or even water) than traditional farming systems. Even more than the GR, the critique argues, the bio-tech revolution will make peasants dependent on high-cost industrial inputs, and whereas the GR was at least transmitted through mainly public institutions, the biotechnology revolution is almost entirely in the hands of private companies whose sole goal is profit.

A powerful ethical broadside is levelled against the association of biotechnology with profit-making and patentability: what right do companies have to patent living organisms? what right do they have

to profit from the new seeds and techniques that normally take as their basis the seeds, plants and knowledge extracted from third world peasants and forest-dwellers who have developed and preserved them for centuries, if not millennia? And finally, the environmentalists argue, the overall effect of biotechnologies is likely to be an economic disaster for the third world because they will allow the industrialised capitalist countries to develop substitutes for all the products, from coconut, palm oil, vanilla to sugar and fruit, which they now import from third world countries and which have become central export earners for many countries. This is a prediction which has gained widespread backing. As Martin Kenney of the University of California has put it, "Overall, the third world countries will probably be the losers, though they will have the opportunity to benefit. Right now, the technology is not going in the direction that would benefit third world economies."³

All of this adds up to a potent indictment. Nevertheless, many will feel doubts. What alternative is there? Is technology as such destructive to the poor or is it not also potentially liberating? If so, how do we take advantage of its liberating aspects? Can any country afford to turn its back on the latest technological developments? Such doubts are in fact reflected in contradictions in environmental campaigns themselves: on one hand, they hurl a broad, often emotional critique against the very nature of the new technologies; on the other the practical thrust of most campaigns is the demand to take the new technologies out of private (multinational) hands and put them in the hands of the state, or to make them available cheaply to third world countries. Much of what is going on is in fact not a campaign dealing with the technologies as such but campaigns against multinationals, as embodied in a slogan put forward by the Malaysia-based Third World Network group, 'the free market versus the green wave'. But this of course raises further questions about whether states are all that benign in contrast to private corporations, or whether cheaply available destructive/immoral technologies become less des-

tructive and immoral for that reason.

Some important light is thrown on all these issues by the set of studies sponsored by UNESCO under review. In contrast to the environmental radicals the volume is sober, at times boringly written, directed to scientific and technical audiences. It supplements the environmentalist critique at many points, but calls on us to modify it in crucial ways.

First, as the UNESCO volume makes clear, 'biotechnology' itself is a very broad field. Basically the term seems to refer to any human manipulation of biological systems; the definitions given by E J DaSilva on page 213 will give some sense of the varying ways the word is used. The new, costly gene technologies are only one type, the 'hi-tech' end of the field. At the other stand ancient traditional technologies of food preservation which have included yeast, fermentation, cheese making and beer production; one can also extend the term to include all kinds of low-cost traditional and new farming practices (the 'peoples' biotechnologies'), making the farmer, in the words of Hobbelink, "the original biotechnologist".

Nevertheless it is not inappropriate that gene manipulation technologies should hold our attention, for the developing technologies that threaten to impact world agriculture are expensive, industrial, laboratory-based ones. The UNESCO volume makes this clear; as the preface states,

Biotechnology costs money. It is the world of business and investment. It is all to do with making and selling products in a highly competitive world. Start-up requires extensive research. Product and process development costs even more. Marketing is crucial for success and is also very expensive...

And the introductory article by C Ratledge practically incorporates a semi-Marxist dependency theory when he argues that unless linkages exist (so that the expensive new products produced by the expensive technologies can be locally consumed and sold) development based on the new biotechnologies is likely only to increase the poverty and dependency of developing countries:

The success of biotechnology is therefore dependent upon an affluent society already being in place, and willing to pay for the new products. This is not to say that developing countries cannot have a biotechnology industry. It must be of a fundamentally different type than that of the developed countries, otherwise, without an affluent society already in place to buy the products, there is the looming

truth that a vicious economic circle would be developed whereby, because of a poor market-demand for a particular product, there will be insufficient profits to maintain the investment to see the next series of products arrive at the market place (pp 4-5).

Ratcliffe thus manifestly denies that the road to prosperity can be through export-focused, high-cost technologies.

Nevertheless, where the UNESCO volume makes a major addition (and modification) to the environmental critique is in taking account of the economic factor and associated political decisions. Junne's article on biotechnology's effect on international commodity trade agrees that the impact is likely to be huge and that it may very well work against the interest of countries by making it possible for countries of the north to develop substitutes for their agricultural imports from the south. Junne describes this as an additional factor to an overall process of declining commodity prices. Yet, as he makes clear, there can be no easy prediction because the technological factors depend (and have always depended) on economic factors and political decisions: "Biotechnology has no *direct* impact on commodity trade. The influence is always mediated by economic and political variables, such as the strategies of large companies that organise the international division of labour, and political decisions of governments which set the parameters for world trade" (p 185). Specifically, the impact of biotechnology (and of the early green revolution technologies) is heavily connected with policies of government subsidies to agriculture, subsidies which have over the years resulted in the impoverishment and dependence of countries of the south and the ability of Europe and the US to dominate agricultural exports, especially in the grain trade.

In fact, the case studies given in the UNESCO volume make it clear that in most cases the very costly industrial biotechnologies are *not* competitive, that without government support, subsidies and trade distorting mechanisms they cannot easily replace 'traditional' (low-input) agricultural products.

A primary example here is the case of High Fructose Corn Syrup (HFCS), a sweetener prepared by the enzymatic transformation of corn starch, which has tremendously expanded after 1975 to replace much of sugar imports by the US. Hobbelink's volume cites this as a 'disaster' for sugarcane producers in Brazil, the Philippines and the Caribbean, who have seen their exports decline dramatically.⁴ But where Hobbelink sees the cause as only technological, the UNESCO volume

points out the economic and political aspect: the replacement of sugar by HFCS has happened only in the United States (and Japan, due to the US pressure) where the interests of maize and sugar producers have combined with more of biotech companies to set high domestic prices for sugar and extremely low quotas for imports. It is only because of these policy measures of protection that HFCS can undersell natural sugar, and in fact the quota system has been challenged as being incompatible with GATT rules (pp 176-80). Undeniably, a genuine 'free trade' in this case benefits the producers of natural products as compared to the high-cost industrial substitutes.

Conversely, while biotechnologies may make it possible for north countries to grow genetically modified substitutes for their agricultural imports, they can also make it possible for poorer countries of the south to develop substitutes for some of their most costly imports. The most important of these is petroleum, and the example studied in the UNESCO volume is that of bioethanol production, in which various raw materials (including sugar from sugarcane) can be converted to ethanol; in Brazil a multiproduct industry is emerging including a bioethanol programme that is having a major impact on

ethanol costs (pp 26ff). Generally speaking, the potentiality of using low-cost technologies for biomass production to provide not only food but energy substitutes is tremendous.

Biotechnologies are thus, in and of themselves, neither miraculous nor murderous. Nevertheless the extremely high-cost new technologies must be seen as products of a voracious, crisis-ridden capitalist development that is not only ecologically destructive but in the end economically unviable. 'Green revolution' history can be cited here. During the very period in which GR technologies were helping the growth of production in some third world enclaves, agriculture production in north America and Europe was rising even faster, based on chemical-industrial agriculture, and this was the very period in which food exports from these countries began to flood the third world and became, in turn, major foreign exchange earners for the US itself. By 1984 the US was exporting 69 per cent of its wheat, 41 per cent of corn, 59 per cent of soyabeans and products, 50 per cent of cotton; in turn this represented about one-half the world trade in grains: 37 per cent of world wheat exports, 56 per cent of coarse grains, 86 per cent of soyabeans and 21 per cent of rice. INDIA'S TEXTILE SECTOR A Policy Analysis

SANJIV MISRA

This important book provides an understanding of why India's experience with textiles is so different from that of other developing countries which produce textiles. According to the author, the most crucial reason lies in the fact that the textile sector in India has been subjected to a degree of state control and regulation which has few parallels in the non-socialist world. Since government policy has played a fundamental role in shaping the development of the textile sector, the main thrust of this study is to analyse the evolution and main elements of India's textile policy.

tural surplus was offsetting its continuing deficit in manufacturing and other areas.⁵

The basic cause for this was the extensive system of government subsidies and supports which benefited petrochemical companies and food processors and trading companies even more than north American and European farmers. By the mid-1980s, however, this 'export boom' was becoming an 'export bust' for the US and the system was running into crisis as, on the one hand, Europe was subsidising its agricultural exports to compete in world markets and, on the other, some third world countries were becoming self-sufficient in food.⁶ Today, if government subsidies in Europe, north America and Japan were withdrawn, the reality is not that their 'advanced technologies' will out-compete 'backward' third world countries in agricultural trade, but that the immeasurably more competitive, still low-cost farming systems of the third world will allow their exports to wreck what is left of the chemically crippled, incubator baby-type pampered farming systems of the north.⁷ It is not likely that the advances in biotechnologies will change this basic reality.

How Japan and France want to save their farmers is, perhaps, their business, but it should not be done to allow them to export at the expense of the peasant communities of the south.

What then should be the demands for state policy (of south governments) regarding the new biotechnologies? Perhaps the most dangerous argument of all is that the south governments should take them over and promote them! The UNESCO volume does contain one argument for this, with Burke Zimmerman as an enthusiast of gene technology arguing that developing countries should give "a high priority to the development of their capacities to conduct advanced research and technological development...[meaning] a commitment in time and money and people...hiring experts from abroad as consultants" (p 269). The basis of his logic is a specious universalism, that "all peoples of the earth should, as a principle of basic justice, be entitled to the direct benefits of new technologies" and that the developing world "can and should aspire to the level of economic and social conditions enjoyed by the most advanced countries" (p 267). It is an argument that will have a natural appeal to India's bureaucrats, intellectuals and scientists.

As against this, it is the basic conclusion of the UNESCO volume that it is precisely the most high-cost of the new biotechnologies that are most dangerous, economically, for the developing countries:

The scientific developments of genetic manipulation, and now of protein engineering with the techniques of site-directed mutagenesis to create new proteins with subtly improved characteristics, have attracted the attention of scientists everywhere. Such is the cost of these techniques, and such is the prohibitively expensive cost of developing new products into the market place from such techniques, that if we wanted to create a hole down which precious money and resources could be poured, then this is that hole... Biotechnology, if not wisely applied, can be a black hole down which valuable resources of money and intellectual manpower of a developing country can disappear without any positive benefit accruing to the investing country [Ratledge, pp 17-18].

The UNESCO editors, thus, appear to agree with the environmentalists that the real service to agriculture can be done through the development of simple, low-cost, people-oriented and people-developed technologies that "improve and enhance the sustainable production systems of traditional farmers rather than replacing them with miracle solutions" [Hobbelink, p 145].

But the danger, to repeat once again, is not so much from private corporations, multinationals or not, which themselves have depended for viability of much hi-tech production upon state subsidies, as from the state itself. Environmentalists with their nostalgia for the Nehru model look to the state to defend farmers and other producers from the multinationals; they may even be encouraged by the increasing rhetoric from all levels of government bureaucracy about 'sustainable development', 'watershed development' and so on. But the logic of statist support for expensive biotechnologies lies in the high-paid jobs for scientists and bureaucrats, the subsidies for politically-influenced companies, the opportunities for dispersal of patronage to politicians; and no matter what sops are thrown to popular participation and sustainable development, this logic will continue to operate as long as centralised state machineries retain control over power and resources. Breaking this control, moving in the direction of a truly Gandhian gram raj, is key to defeating the destructive aspects of the new biotechnologies.

Finally, as for the question of patents, at a practical level the problem does not seem as serious as made out: if patents will make expensive and unsustainable biotechnologies less accessible, all the better! Easily accessible enslaving technologies are more dangerous. At a principled level, though, we can do little better than quote back to the US policy-makers the

greatest agrarian democrat of that country:

Laws abridging the natural right of the citizen should be restrained by rigorous constructions within their narrowest limits. It has been pretended by some (and in England especially) that inventors have a natural and exclusive right to their inventions and not merely for their own lives but inheritable to their heirs. But while it is a moot question whether the origin of any kind of property is derived from nature at all, it would be singular to admit a natural and even a hereditary right to inventors. It is agreed by those who have seriously considered the subject that no individual has, of natural right, a separate property in an acre of land, for instance. By a universal law, indeed, whatever whether fixed or movable, belongs to all men equally and in common is the property for the moment of him who occupies it, but when he relinquishes the occupation, the property goes with it. Stable ownership is the gift of social law and is given late in the progress of society. It would be curious then if an idea, the fugitive fermentation of an individual brain, could, of natural right, be claimed in exclusive and stable property. If nature has made any one thing less susceptible than all others of exclusive property, it is the action of the thinking power called an idea (Thomas Jefferson, to Isaac McPherson, August 13, 1813).

Privatisation: Cure or Curse?

A P Saxena

Privatisation: Option and Challenges edited by S R Mohnot; CIER, New Delhi; pp VIII + 418, Rs 240.

OF late, privatisation has become a buzz word signifying a panacea for many economic problems, in particular relating to public enterprises. The expert prescriptions flowing in from the north press for taking the road to privatisation since economic redemption is only possible through glorification of the market, even though it may prove woefully inadequate for a society where large masses have to be brought to an acceptable standard of living. The protagonists of privatisation seek to discredit planning and state ownership altogether when this is not only unwarranted but harmful especially to the developing countries to whom development through private initiative based on market forces offers no solution to their specific problems.

The present volume incorporates the papers representing the deliberations of a conference organised by the Centre for Industrial and Economic Research (CIER) in New Delhi in March 1991 in technical co-operation with the Inter-Regional Network on Privatisation, UNDP. The papers have focused on privatisation in the context of comparative advantage of the public and private enterprise models. The results of the workshop were sought in the Indian context even though references have been made to the international experiences. The key concerns of the workshop were the issues involved in the choice of different enterprise models with special reference to socio-economic goals, organisational situations and operational mechanisms.

A common problem posed in the different papers is the intent and purpose of privatisation since, not infrequently, it means different things to different people. According to Ramanadham, "privatisation can be through ownership changes, organisational changes or operational changes. Or to put it another way, there can be privatisation of ownership, privatisation of management or privatisation of enterprise disciplines in substantive terms" (p 2). Mohnot argues that "the main inspiration has to come from the anxiety to rectify macro-economic imbalances—and the acid test for privatisation is the comparative advantage of an enterprise model for a specific public sector undertaking" (p 29). Ramaswamy Iyer has incisively examined the scope for privatisation in the context of *existing* public enterprises—from the point of view of policy or strategy, the *acceptability* of the idea of transferring a public enterprise to private ownership or management control, and from a practical point of view, the *feasibility* of effecting such a transfer (p 17).

Privatisation in the global perspective has been analysed by Dalal who has appraised the situation in the case of centrally-planned economies, the industrial countries and the developing countries. He has isolated the

underlying trends which are common to all countries which have made significant moves towards privatisation. Dalal has done well to stress that privatisation is as much a political as it is an economic instrument since governments with strong political commitment in favour of privatisation along with popular support have succeeded in implementing privatisation schemes (p 86). Implementing yes, but not necessarily improving the bottom line. Operational results of Japan Airlines (JAL) released recently reveal that though JAL was privatised in 1987, that has not prevented it from incurring losses necessitating the closure of four important regional headquarters at New York, Seattle, London and Hong Kong and the suspension of operations in India.

Sherry Stephenson (OECD) has attempted an overview of the privatisation experiences in several countries, with particular reference to UK and France. The British government carried out privatisation over the entire decade of the 80s continuing it till 1991, when the privatisation cycle is assumed to have been nearly complete. The French programme lasted for a two-year period only and was stopped with the loss of majority in parliament. In both countries many workers were affected—almost 1 million jobs in the UK and 9,00,000 jobs in France (p 74). Privatisation will indeed be a curse if we have ever to face such consequences! Yet in spite of such massive, planned annihilation of workers, the author concludes, that the two privatisation programmes are considered on the whole, to be highly successful. The primary motivation for such an experiment in UK as well as France included the need for obtaining additional revenues to secure a reduction in budget deficits—an approach which has been roundly criticised as 'selling the family silver'. Ramaswamy Iyer has rightly cautioned in his paper that "if the proceeds realised from the disposal of shares is used by the government to reduce the budget deficit or to avoid the imposition of additional taxes, it will be the case of using capital receipts toward current expenditure" (p 181).

Francois Etti's (World Bank) paper on 'Options for Restructuring Public Enterprise' is an oversimplified factual recall of public enterprises in India. The listing of general issues and areas for reform follow the usual platitudinous World Bank line: reduce the size of public sector, devolve greater autonomy and restructure the remaining potentially viable units. It has to be remembered that the 47 chronically sick public enterprises mentioned by Etti include 27 inherited from the private sector. Similarly, the comments on MOUs—e.g. their drawbacks in design, that they add to, rather than supersede, the existing controls and

hamper their potential budgets—are not supported by any analyses.

Suresh Kumar's paper on 'Non-Privatisation Reforms of Public Enterprises: The Indian Case' cogently argues the case for the altogether new experiment of MOU which seeks to simulate, through a process of consensus and co-operation, a competitive environment, an aspect which gives the mechanism a tremendous strength. Such a mechanism, according to Kumar, "is an ideal one for developing countries in general for improvement of Public Sector performance before resorting to any kind of privatisation" (p 112).

If the public sector was supposed to perform the role of a model producer, a model distributor, a model employer and a model contractor, it is a moot question if privatisation, advocated on limited—largely developed—country experience will ever meet these high expectations when we ought to know well that the interests of a large nation-wide workforce have to be safeguarded even under schemes of rationalisation and reforms. Industrial sickness on grounds of resources or low productivity of capital is not the monopoly of public enterprises in India, as many overseas experts and international lending agencies would have us believe. The number of sick units in the private sector in India exceeds 2,00,000 with blocked funds of commercial banks exceeding Rs 60 billion. In fact, inclusive of the funds provided by developmental institutions (i.e. government) and the financial agencies, the total quantum of idle resources would exceed Rs 250 billion, affecting a workforce running into millions.

It is inevitable that in a workshop seeking to identify and understand the new, emerging intervention strategy of privatisation, the quality of papers will be uneven. But even so, some could be categorised as unnecessary and could have been excluded to the relief of the readers. Ponna Wignaraja's 'Privatisation in the New Social Ethos' is a jumble of catch words which have been dished out at innumerable conference without regard for context or serious empirical evidence. But these gaps are more than set off by the painstaking effort of the editor in providing an excellent write-up on 'Major Conclusions' (pp 353-62) followed by a statement of 'The Basic Issues' (pp 363-66). Equally well done is the epilogue, 'An Explanatory Action Plan for Privatisation in India'. These three papers admirably summarise the different issues which interlace the current debate on privatisation. The publication will be welcomed by all those interested in the subject since India has large, strong public and private sectors, each in need of continuing care for improved performance, productivity as well as beneficial concern for the workforce. In our specific context, we have to look for privatisation, in whatever form or style, which is a cure and not a curse. The need is to avoid simplistic advice to adopt privatisation without looking into the possibility of adapting or even rejecting the proffered options.

Strengthening India's Patent System

Implications for Pharmaceutical Sector

H Ashok Chandra Prasad
Shripad Bhat

This paper examines the factors behind the current demand for strengthening the Indian patents system and the effect of such strengthening on the pharmaceutical sector. Against the background of their study of these issues, the authors attempt to arrive at policy conclusions and to answer the following questions: (i) Should India amend its Patents Act, join the Paris Convention or toe the Dunkel line? (ii) If the Patents Act is to be amended, what are the modifications needed? And (iii) what policy changes are needed in the context of the pharmaceutical sector specifically?

I Introduction

THE issues of Intellectual Property Protection (IPP) is receiving great attention at present and there is great pressure on developing countries in general and India in particular to strengthen their Intellectual Property Rights (IPRs). The purpose of this paper is not to go into the whole gamut of discussions pertaining to IPRs or their evolution in international negotiations.¹ The purpose of this paper is to investigate the following specific issues:

(1) The factors behind the emphasis on strengthening the Indian patent system in India.

(2) The effect of strengthening the Patents Act in the case of India's pharmaceutical sector.

(3) The *modus operandi* for strengthening India's patent regime.

In the light of our study of the above mentioned issues, we have made an attempt to arrive at policy conclusions, which try to answer the following questions: (1) Should India amend its Patent Act, join the Paris Convention or toe the Dunkel line? (2) If India has to amend its Patent Act, what are the modifications needed? (3) What policy changes are needed in the context of patents for the pharmaceutical sector?

The main sources of data for this study are the patents data and company's data at the ISID. The former are available from 1972 to 1989 and the latter from 1974-75 to 1989-90. Besides these data bases, Monthly Index of Medical Specialities (MIMS), Indian Drug Manufacturers Association (IDMA), Organisation of Pharmaceutical Producers of India (OPPI), World Intellectual Property Organisation (WIPO), United Nations Conference on Trade and Development (UNCTAD), Department of Science and

Technology (DST), Government of India, etc, have been used wherever necessary.

II Factors behind Emphasis on Strengthening Patents Regime

In this section, let us examine the important factors behind the new emphasis on strengthening the patents regime in India. This involves the examination of the following factors: (1) The extent of dependence of India on different countries for technology. (2) The situation in developed countries, especially US with respect to their economy, balance of payments position and future growth. (3) The change in the political situation in India, developed countries and world in general.

India's increased dependency on developed countries for technology can be seen by examining three aspects: (1) The importance of different countries in the patents granted by India. (2) The dependency and relative dependency ratio of India with respect to patented technology. (3) The technology gap between India and the developed countries and India and other developing countries and other technology-related indicators of India.

IMPORTANCE OF THE DIFFERENT COUNTRIES IN THE PATENTS GRANTED BY INDIA

Table 1 shows that the patents granted by India to developed countries forms a major chunk of all patents granted by India and the only important category among the developing countries is the patents granted by India within the country. Among the developed countries, the US (as an individual country) and Europe (as a group of countries) occupy an important place. Since 1982 the percentage of patents granted to Japan is increasing,

though it is nowhere near that of the US. Country-wise, the US tops the list of patents granted by India. This is given in the official publication of the government of India² which says that the US simply accounted for 40.3 per cent of total applications filed for patents by foreign nationals during 1989-90. This is followed by West Germany, Japan, UK and France. Then comes Switzerland, Russia, Netherlands, Italy and Sweden. Among the developing countries the patents granted by India to Indians is lower than that of the US, individually and Europe in toto. Among the LDCs (other than India), East Europe is very important in 1984-89. Next is Israel and NICs, Malaysia and Thailand. South Asia and Africa are nowhere in the picture.

Table 2 shows the percentage of patents granted by countries and by sectors. Sector-wise, sectors C and B shows the highest percentage of patents granted. Among the countries also C and B sectors are important in the case of the patents granted to developed countries. But in the case of patents granted to Indians all the sectors seem to be well balanced.

Thus, the tables clearly show that India depends on developed countries for technology³ and that too on a single country like the US or group of countries like European countries. Sector-wise India's dependence is more in C (chemistry, metallurgy) and B (performing operations, transporting) categories. One note of caution is that we have not given weightage to type of patents by the extent of the technology involved.

DEPENDENCY AND RELATIVE DEPENDENCY RATIO OF INDIA WITH RESPECT TO PATENTS

The dependency ratio (which here, means the total number of patents granted by India to non-Indians as a proportion

of the patents granted by India to Indians) given in Table 3 shows that it has been high till 1978, low from 1979 to 1982 and then again higher since 1983. While the total number of patents (both in force and sealed) has fallen, the dependency ratio has not fallen over the years, except for the initial fall from 1968 to 1970 (i.e., before the Patent Act was implemented), indicating that India's increased dependency for technology on developed countries has not been allowed to materialise due to the 1970 Patents Act.

The relative dependency ratio (which, here means the total number of patents granted by India to a particular foreign country (or group of countries) as a proportion of the patents granted by India to Indians) also given in Table 3 shows that India's relative dependency ratio is still absolutely higher with Europe than with the US and India's dependency on the US (as an individual country) and Europe (as a group) is more than India's dependency on itself. The relative dependency ratio of India with the US which has always been at a lower level than with Europe fell from 1976 to 1983 and then regained to the earlier level. But the relative dependency ratio on Europe also fell from 1976 to 1980, then it rose, but never regained its earlier level, thus narrowing the gap between the relative dependency ratios on the US (a single country) and on Europe (a group of countries). The relative dependency ratio on Japan, though lower than both the US and Europe, and has shown a fall during 1976 to 1981, has regained its earlier level and even risen to higher levels. The relative dependency ratio of India with other developing countries which is also at a lower level, has also fallen during 1976 to 1981, and then risen, but has never regained its earlier level. Strangely the relative dependency ratio of India with USSR has

been very low and it shows many ups and downs.

Another important fact is that India's dependency ratio in terms of patents in force is higher than in terms of patents sealed as can be seen in Table 4.⁴ The table also shows that India's dependency ratios (both in terms of patents sealed and patents in force) before 1972, i.e., the period before the 1970 Patents Act was implemented, was very much higher. While during the period 1976-77 to 1980-81 the dependency ratio in terms of patents sealed have shown a fall and then a gradual rise, the dependency ratio in terms of patents in force shows a fall through the entire period after 1976-77. This is possible because of the greater death rate of old patents, though the birth rate of new patents after 1981-82 is rising.

The above analysis brings into focus the following important facts: (1) India's relative dependence on other countries, especially the developed and among them the US and Europe, and among them on the US as a single country has been increasing despite the fact that total number of patents sealed is falling. In today's unipolar world this has far-reaching implications. (2) India's dependency on the west, which fell from 1977 to 1980, coinciding with the Janata Party rule, shows a rise from 1981 during the Congress Party rule. (3) As noted earlier, the fact that total number of patents are falling consequent to the 1970 Patent Act and the fact that dependency on developed countries is not falling, shows that the relative high dependency on western technology has not been allowed to materialise.

Whether a lower dependency ratio is good or bad is a debatable question. But certain inferences can nevertheless be made. For a relatively underdeveloped economy a lower dependency ratio indicates that it is less dependent on foreign

countries for technology. This necessarily does not mean that it is good for the economy as technology transfer will be low, while the economy has not yet reached a stage of relative self sufficiency in technology.

However at this stage we are concerned only with showing India's relative dependence on other countries for technology which has put pressure on India to accept the new IPRs and the above analysis clearly shows India's continued dependence and increasing dependence on developed countries for technology in terms of patents in force and patents sealed respectively.

INDICATORS OF TECHNOLOGY GAP AND OTHER TECHNOLOGY-RELATED INDICATORS

The technology gap between India and developed countries and India and other developing countries can be judged with the help of comparative indicators of technology like expenditure on R and D as a percentage of GNP, per capita R and D expenditure, number of scientists, engineers and technicians (SET) per thousand population, SET in R and D per thousand population.

The other technology-related indicators of India which show its dependence on technology from other countries, especially the developed countries are the following: (1) India's trade in technology-intensive products; (2) External assistance for S and T programmes received by India; (3) Foreign investments in India; and (4) Royalties, lumpsum amounts, technicians' fees, etc, received and paid by India.

In Table 5, the comparative technology indicators of India and other countries are given. Column 1 gives the expenditure on R and D as a percentage of GNP for selected countries. This column shows that India invests a very small percentage

Source: Calculated from the data available at the ISID.

of GNP on R & D, while most of the advanced countries devote more than 2 to 3 per cent of their GNP on R and D. Even Pakistan is ahead of India with 1 per cent expenditure on R and D in 1987. The gap becomes more sharper when we examine the per capita R and D given in column 2. India is at a very low level of the US \$ 2.76, while most developed countries are above the US \$ 200 level and some even above the US \$ 500 level. NICs like Republic of Korea and Singapore show a level of the US \$ 75 and 68 respectively. Column 3 shows the number of SET per thousand population which is also at a very low level of 4.50 in 1990 which is lower than the developed countries, NICs and even other developing countries like Brazil, Philippines, etc. This fact should make us realise that though India boasts of being one of the most important nations in the world in terms of SET, in relation to India's population, India is at a very very low level. Similarly SET in R and D per thousand of the population is at a very low level as can be seen in column 4.

Table 6 shows the export and import market shares of some selected technology-intensive products of India and some other countries. This table shows that India's import market shares are higher than export market shares and is also relatively higher than most of the other countries given in the table for almost all the four categories of technology-intensive goods.

Table 7 shows that the share of imports of technology-intensive products are high in India's imports and have risen in the 80s, though it shows some ups and downs as well. More important, is the fact that while the ratio of exports to imports is at the 0.50-0.70 range in the 80s the ratio of technology-intensive exports to technology-intensive imports is still lower at the 0.11 to 0.26 range. This shows that while India is relatively more dependent on other countries in its commodity trade, it is more so in the case of technology-intensive commodity trade. The ratio in the case of trade of others commodities is more than 1 in all the years indicating clearly that India's adverse balance of trade has been due to trade in technology-intensive products. The only point of solace for India is that the ratio is almost constant over the years in the case of technology trade, while it has fallen in the 80s in the case of total trade.

Table 8 shows the external assistance received by India for S and T programmes which is a sizeable amount of US \$ 110.35 million in 1987. Among the donors the bilateral sources are more important than multilateral sources, indicating India's greater dependence for technology

sources. Here of course, the European countries are the principal donors.

Table 9 shows the foreign investment stocks till 1989 and fresh approvals to India in the 90s. The table shows that the manufacturing sector and in this the technology-intensive products have been important in the foreign investment stocks till 1989. Among the new approvals also (in terms of numbers) technology-intensive sectors have been important till 1990. The total approvals of foreign investments in 1992 is more than the stock of foreign investments till 1989, and the US has a major share in the new approvals. The technology gap between India and the developed countries is cited as the important reason for liberalisation of foreign investment and today India is dependent on the developed countries in general and the US in particular for technology transfer via foreign investments. In fact 60 per cent of foreign direct investment approvals between August 91 to February this year is by the US.⁵

Table 10 shows the payments and receipts by India for technology trade in the form of royalties, technical know-how and technicians' fees. Royalties are mainly the payments/receipts of recurring nature related to patented technology; technical know-how payments/receipts are mainly for lumpsum (non-recurring) royalties⁶ and technicians' fees are the payments/receipts for technicians. While the receipts are small under all categories, payments are quite substantial, with payments for technical know-how becoming increasingly important in the 80s. This shows the preference in the 80s of the government to purchase technology for lumpsum payments. This of course decreases our dependence on foreign countries to some extent, yet lumpsum payments can be for both patented and non-patented techno-

logy and the whole country's dependence has been increasing. If we see the percentage change in the nine-year period of 80s over 70s (from 1971-72 to 1979-80), lumpsum payments show a per cent increase of 1,099 per cent whereas for royalties it is 343 per cent. A remarkable increase in payments of management fees, etc, and payments for other professional service (which are also related to technology transfer) has taken place in the 80s.

The above analysis clearly shows the technology gap between India and other countries and India's continued and increasing dependence on advanced countries in general and some countries (the US) and groups of countries (Europe) in particular for technology.

ECONOMIC SITUATION IN DEVELOPED COUNTRIES

In the earlier section, we have noted the continued domination of developed countries and the growing technology gap between developed countries and developing countries like India. Here we intend to show how the changing economic situation in the world and in the developed countries have made them to focus their attention on issues like IPRs. (Here we consider some important indicators needed for our analysis like exports, imports, trade balance, current account balance, growth rate of exports, imports, etc, for the world and some developed countries like the US, the UK, etc, and trade between DCs and trade of LDCs with DCs.)

Source: Calculated from the data available at the ISID.

Table 11 shows the exports, imports, trade balance, current account balance, export and import of goods and non-factor services in GDP for the world, industrial countries in total and for some industrial countries and developing countries. The table shows an increase in trade and current account deficits for countries like the US.

In Table 12 the growth of trade in manufactures is given which shows that in the 80s there is a fall in growth rate of exports of the world in general, a relatively greater fall in exports of developed market economies to developing countries as compared to their exports to developed countries. Further while the exports from developed to developing economies has fallen to a great extent, exports from developing to developed countries shows a still greater fall. Thus the developed countries are depending less on developing countries for imports weakening the position of developing countries. Meanwhile the growing balance of payments deficits of the developed countries, especially the US has made them to search for new areas of interest to them and IPRs is one such area. Table 11 also shows that the balance of payments for Japan and West Germany are positive and they are neither the initiators, nor vociferous in demanding IPRs. While the weakness of India and LDCs have further weakened them in their bargaining power, the weakness of the economic situation of the US and other European countries have made them vociferous in the three new issues 'Services', TRIPS, and TRIMS.

CHANGE IN WORLD POLITICAL SCENARIO

The change in the world political scenario has also contributed to the new emphasis on TRIPS. The fall of the Soviet Union has made this world a unipolar world with the US as the only superpower. The political and economic weaknesses in India had made it vulnerable at the very moment when the US started mounting pressure to liberalise. Many developing countries, which were hitherto opposed to the new patents regime have mellowed down and even adopted the new regime. The fall in the importance of UN agencies like UNCTAD (which also have slowly shifted to the philosophy of liberalisation) and the rise in importance of World Bank-IMF combine and the dependence of India on these organisations have enabled the US and other MDCs to pressurise India to accept the new patents regime.

To sum up, while the dependence of India on different countries for technology had prepared the ground and the economic conditions of the advanced countries have made the developed countries more vociferous, the changed poli-

tical situation in the world and in India, have finally paved the way for pressurising India to change its patents regime.

III

Impact of Strengthening Patents Regime on Drugs and Pharmaceuticals

The impact of strengthening the patents regime on drugs and pharmaceuticals can be seen under the following headings: (a) Effect on prices, (b) Other effects— (i) Effects on different sections of the population; (ii) Effect on Indian industrial sector in general and by types of companies in particular; (iii) Effect on other sectors of the economy via linkages; (iv) Effect on technology transfer to India, development of indigenous technology and quality of drugs; and (v) Effect on balance of payments.

EFFECT ON PRICES

The most debated issue at present regarding the impact of strengthening the patents regime on the Indian pharmaceutical sector is one of rise in prices. However, the arguments of many supporters and opponents of India's present patents regime are not backed by data and also data given by alternative sources differ greatly. A rigorous quantification of this aspect, though not impossible, is difficult at this stage. So we have made an attempt to arrive at logical conclusions weaving together pieces of data which are readily available to us. The effect on prices can be seen by examining the following aspects: (i) Examining the changes in drug prices before the present patents regime, and immediately after the introduction of the present patents regime; (ii) Examining the impact on prices in India and prices in other countries which have/have not

adopted the new patents regime; and (iii) examining the value of foreign patented drugs and drug formulations in India at present and examining the possible impact on prices by strengthening the patents regime.

The present patents regime commenced with the Patents Act of 1970 which became operative from 1972. Studies by Mehrotra and others⁷ have shown that the prices of drugs and drug formulations fell considerably after the introduction of the 1970 Patents Act and "both the public sector and private sector companies were involved in the technological development which helped India boost its bulk-drugs formulations". Misuse of patents by TNCs have also been highlighted in these studies. The study of Agarwal and others⁸ shows that prices of many drugs outside the purview of the Drug Prices Control Order (DPCO) have also fallen. A look at Table 3 shows that the price index of pharmaceutical items is lower than the price index of all commodities for most of the years. The drug price index which shows a rise by 41.9 points by 1970-71 with 1961-62 as the base year and is lower than the index for chemicals and chemical products and for all commodities, is uniformly lower than the price increases of all commodities in the 70s and 80s. Even in the 60s the price index for other commodities was higher than the price index of drugs by the same times or higher in some years (1964-65 and 1966-67), and hence one cannot consider that the 1970 Patents Act as the main factor affecting prices of drugs. In fact the more important factor which has kept the drug prices under control directly is the DPCOs and even today 74 per cent of the drugs and formulations in India are under control. The effect of patents on prices comes indirectly through increase in input costs, necessitating price rises.

The above analysis shows that though the relatively lower rise in prices of pharmaceuticals in the 70s and 80s are due to the two important factors, namely (1) the relaxation in the patents regime helping indigenous units, and (2) the drug price control act (especially the 1970 act). The latter is not only the more important of the two, but overshadows the former in its effects. Today also the above two factors are still in effect, while the Indian drug industry has come to age and become quite competitive and capable of producing a major portion of the necessary drugs and drug formulations. As stated by Patel D S currently, this segment (Indian companies) of the (pharmaceutical) industry contributes more than 60 per cent of the country's production and demand. The national sector is involved in manufacturing of life-saving drugs not

only for the local market but also for the international market. India became self-sufficient in various raw materials by producing them indigenously ... it led to the creation of a strong R and D set-up. It also gave rise to the development of the ancillary industries and petrochemical projects. Thus a strong base was created which resulted in the growth of the industry. The post-1980's era saw more changes in the pharmaceutical industry, as it became a global player. The industry started exporting bulk drugs which were earlier being imported. In the process the industry became a foreign exchange earner and net exporter. Today, in certain products, India is the only supplier or controls a major share of the market.⁹ Further as observed by Mehrotra N N¹⁰ the process technology involved for many of the drugs produced by the Indian sector companies "fall under the term high-technology as defined by the Ramanathan Committee of the government of India for the same while examining the technology status of foreign companies".

In Table 14 we have computed the revealed competitive advantage (RCA) and revealed comparative disadvantage (RCD) of the pharmaceutical sector of India and some developed and developing countries, following both the market share approach and Bela Balassa approach.¹¹ The table shows that RCA (market-share method) of India in 1988 compared to other countries is high and RCD quite low. If RCA (Bela Balassa method) is considered then India's RCA in 1988 compared to 1980 has increased and is more than all the developed and developing countries given in the table except for Indonesia and Malaysia. But RCA in 1988 compared to 1970 of India is the highest. India's RCD (Bela Balassa method) in 1988 compared to 1980 is quite low compared to the developed and some developing countries. While RCD of India in 1988 compared to 1970 is high, it is lower than many underdeveloped countries. In 1988 compared to 1980 only India, Indonesia

and Malaysia have relatively higher RCAs and lower RCDs. In 1988 compared to 1970, only the US and UK have relatively higher RCAs and very low RCDs. But India has very high RCA and relatively high RCD. On the whole the above analysis shows that India's RCA has improved remarkably and RCD has become less compared to even the developed countries.

While opponents to change in the patent system emphasise that competitive position has been achieved by India due to India's patent regime, in the case of drugs and pharmaceutical we have seen that this has been possible mainly due to PCO and then due to the present patents regime. So while there is no need to fear much, any changes in the patents system, we have to be more careful of a sudden decontrolling of the prices in this sector.

COMPARATIVE PRICES OF PHARMACEUTICALS

As mentioned earlier, the rise in prices of drugs and medicines in India has been lower than the rise in prices of chemicals and chemical products and all commodities. But these indices are based on a sample of 12 bulk drugs and 19 formulations only and almost all these drugs are under price control.¹² However, we should note that at present, though the number of drugs under price control has been reduced from 375 drugs (and their formulations) to 145 bulk drugs (and their formulations), actual control in terms of sales has declined only marginally from 79 per cent to 74 per cent. So, the results of the price indices (which includes the drugs under price control) broadly reflect changes in the pharmaceutical sector.

The table given by the OPPI (Table 15) shows that the prices of important drugs in India have risen in 1992 compared to 1986, though marginally in many cases. Our calculations (Table 16) of a larger sample of drugs (which are usually quoted) also show a rise in price of important drugs, also marginally in many cases. However, these drugs are not important in terms of their percentage in total consumption in India. So in Table 17 we have given the prices of some of the drugs which form a major share of India's consumption. In the case of these drugs the prices are constant or have risen very marginally. The more important aspect is that the drugs quoted by Keayla, IDMA, etc. are US patented drugs, while the drugs quoted in Table 17 are off-patent or ones whose patents have expired and are the most important items consumed by India. This further highlights the fact that in the case of a major percentage of drugs and medicines consumed in India, prices are not greatly affected by patents. On the other hand, the DPCO has been a major influence on prices, while many people have been (knowingly or unknowingly) highlighting the prices of drugs patented, which form a very small percentage of the total consumption in India. In fact B K Keayla¹³ has written "A committee of the US senate (Kefauver Committee) had commented in 1959 that 'Prices of certain drugs and antibiotics in India were amongst the highest in the world and that in drugs, India was one of highest priced nations'. This was before the enactment of the Patents Act 1970. It is noteworthy that prices of drugs in India are now amongst the lowest in the world... The above price comparisons are only a few examples. In most countries which followed product patents, prices of these and other pharmaceutical products are as high if not even higher." While it is true that the US Senate had commented in 1959

that prices were very high in India and the prices after 1970 when the Patents Act 1970 was enacted were low, the low prices especially in the 70s and 80s is not a logical conclusion of changes in patents system, rather it is due to the DPCO in India which was also introduced in 1970 and the 1962 Drug (Display of Prices) Order.

Further, in the list usually taken by Keayla and others few drugs are under DPCO (while most of them are under product patents abroad), while in our list which covers a major part of India's consumption, all are under DPCO and few are under product patents abroad. Thus even by introducing product patents, a major portion of drugs (given in Table 17) will not be affected, while removal of price control (vehemently proposed by both OPPI and IDMA) will surely affect the major percentage of drugs consumed in India. Thus not only are prices for drugs low in India, a major part of them are off-patent and the DPCO has been successful in limiting the rise in prices of drugs.

If we compare the prices of some drugs in India and other countries (Table 15), we can notice that drug prices are comparatively lower in India. In fact as mentioned in the IDMA-OPPI joint report,¹⁴ "Drug prices in India are among the lowest in the world". This is a fact con-

firmed by the Tariff Commission and official surveys and studies. As can be seen in Table 18, compared to advanced countries like UK and the US, drug prices in India are very much lower. But it may be argued that comparison of drug prices between India and advanced countries, by converting the prices in terms of foreign currencies to rupees may not be appropriate unless it is for purpose of trade and for imported drugs. However compared to India's immediate neighbours also (where useful comparisons can be made), prices in India are comparatively low both in 1986 and 1992 and the rise lower and fall greater from 1986 to 1992 for many drugs (Table 15). Among the Asian countries, Sri Lanka and Indonesia have joined the Paris convention in 1952 and 1950, respectively. Pakistan, like India has not joined the Paris convention. Indonesia under its liberalisation policy has extended "deregulation in investment procedures to agriculture and the pharmaceutical industry"¹⁵ while in 1992 it accepted product patents and interestingly the prices of important drugs in Indonesia are very much higher compared to prices in India especially in 1992 and this rise cannot be due to product patents introduced in the same year. This shows that price changes in pharmaceutical sector are not mainly due to patents and as seen in the Indian

case, it is due to DPCO, India which is in a very competitive position compared to other LDCs, therefore should not fear the strengthening of the patents regime. On the other hand, regarding decontrol of drug prices, a judicious approach is needed.

INDIGENOUS PRODUCTION OF DRUGS COVERED BY PRODUCT PATENTS ABROAD

The issue of value or percentage of indigenous production of drugs covered by product patents abroad is one where there are conflicting versions. The controversy was triggered by the statement of the United States Trade Representative (USTR) Carla Hills during her visit to India in 1992, that only 5 per cent of the products marketed in India are covered by patents. This statement was made to "persuade the Indian government that recognition of product patents as in China would not have the feared adverse effects."¹⁶ The Indian Drug Manufacturers Association (IDMA)¹⁷ immediately came with a study indicating that in the therapeutic groups where patented drugs are there, nearly 46.32 per cent of these groups are covered by patents in the US and patented drugs in the total pharma market is 21.47 per cent. The percentage of drugs under the different therapeutic groups are given in Table 13. The minister of state in the ministry of chemicals and fertilisers¹⁸ stated that about 10-15 per cent of total production in the country is covered by patents abroad. The break-up of the different therapeutic groups given by the ministry are also given in Table 13. The IDMA study is based on Operational Research Group (ORG) report and the US Health Department Publications, 'Drugs

under Patent' and 'Approved Drug Products' and the government statement is based on 'Available Information'. The IDMA¹⁹ which has made a study for Ranitidine 150 mg tablets makes the following observation, "Had it not been for the Indian Patent Act 1970, it would not have been possible for anybody other than Glaxo or their licencees to manufacture and sell this product in the country. Under such monopolistic situation,

Glaxo, in light of their international pricing policy would have priced the product hypothetically at least 10 times more expensive of its present sale price, i.e., Rs 16.10 per tab. It would not be wrong to assume that at this exorbitant rate, offtake of this product would come down substantially. Therefore under the scenario existing after amendment of the Indian Patents Act to fall in conformity with the Dunkel's proposal, the Indian population

would have for its consumption a mere 1/10th of the total medicine available to them today, but at 10 times the existing prices."

The above analysis shows that the lower limits of the estimates of manufacture of products patented abroad is 5 per cent and the upper limit is 21.47 per cent. Moreover, the major player in price changes is the DPCO. As long as the composition of the list of drugs not to be patented remains unchanged, the feared danger of strengthening the patents regime in India is apparent than real. However a careful and judicious policy on price controls is needed and not simply a total decontrol of prices of pharmaceuticals as advocated by many people especially the IDMA and OPPI. In fact, it has been stated²⁰ that drug prices have increased as a result of India's recent liberalisation efforts, and of course this has nothing to do with patents. As expressed by Vaish (secretary, department of chemicals and petro-chemicals, ministry of chemicals and fertilisers,

government of India),²¹ over the seeming paradox of keeping prices under check to ensure that it reached every person, and freeing the sector from checks as demanded by the industry to ensure maximum production, "we have to see that supply line and production is maintained, yet there is need to keep control". One should also note that this is a sector involving social security and while the EEC has its

own social security measures and the US is also implementing new measures on these lines, a developing country like India cannot completely underplay the importance of health care to its population under the pretext of profitability. Thus there is nothing wrong in continuing with the price control on drugs. Otherwise, firstly, the government as the largest buyer of drugs and secondly, the common con-

sumer (not the common man as we will see later) will be hit by the rise in prices. So while we advocate a judicious policy in drug price controls, we see no reason to fear the strengthening of the patents regime in the case of drugs and pharmaceuticals by introducing product patents. This is not to say that the 1970 Patent Act was not useful. In fact it was useful and along with DPCO has strengthened our pharmaceutical sector. But in the present situation, when we have become competitive in pharmaceutical sector there is no need to continue with this Act in the same form. However, the pertinent question to be answered is, how exactly the patents regime can be strengthened by India in the case of pharmaceuticals? To this question, we will turn to Section IV.

OTHER EFFECTS OF STRENGTHENING PATENTS REGIME

The other possible effects of strengthening the patents regime can be explained as follows.

Effect on Different Sections of the Population: An increase in drug prices is believed to affect the common man. But as rightly pointed out by Mitra Sisir,²² "We ought to be clear about the description of this 'common man'... But we have to make another division of the 'more common' amongst us, that is, the people who live below the poverty line". According to official estimates, this group consists of 30 per cent of our population²³ and these people hardly spend on drugs and medicines, while basic necessities like food, clothing and shelter are themselves not available to them. So the question of drug prices does not concern them. India is a drug starved country. The per capita consumption of drugs in India in 1989 was Rs 34 (Rural Rs 8). This is very low compared to other developing countries like Republic of Korea (Rs 346), Egypt (Rs 190), Turkey (Rs 159), Taiwan (Rs 159), Philippines (Rs 95), Nigeria (Rs 70), Indonesia (Rs 42) and Pakistan (Rs 43), even in 1984.²⁴ Further as pointed out by Mitra Sisir,²⁵ the expenditure on drugs in India "is generally less than 10 per cent of the total medical care cost", and medical care expenditure forms 2.6 per cent of total expenditure in India.²⁶ Among the other two classes, the rich and the middle class, the former can afford any rise in prices of drugs, while the latter may be subjected to hardship. However, there is the fact that even if the most liberal estimates are taken, drugs product patented abroad will not be more than 30 per cent of the drugs produced in India and again the changes in drug prices can come about mainly due to decontrol of prices, rather than patents. If the possibility of substitution of non-patented drugs

for patented drugs is further explored then the effect of patents on prices can be further lessened; on the whole, strengthening the patents regime especially by accepting product patents in pharmaceuticals will not have any great adverse impact on common man in particular and the people in general.

Effect on Indian Pharmaceutical Industry: The strengthening of patents regime is considered to affect the Indian pharmaceutical industry. In the total sales of drugs and drug formulations in India the share of drug formulations is 76.5 per cent in 1989-90 (78.4 per cent in 1988-89). Therefore, it is mainly drug formulations that are important in the total sales. In fact, India is almost self-sufficient in drugs and pharmaceuticals and indigenous production to the total indigenous production plus imports is 89.4 per cent in 1989-90 (91 per cent in 1988-89). Moreover, India is a net exporter of drugs and pharmaceuticals at Rs 204.78 crore in 1989-90 (Rs 20.60 crore in 1988-89). Interestingly, the pharmaceutical sector is one in which the concentration is very less. The concentration ratio of drug formulations in 1989-90 (shown by the share of top four firms) is the lowest among all manufactures of non-primary commodities at 17.5 per cent²⁷ and interestingly in the primary commodities industries also only a few items are below this level.

While it is not possible to estimate the possible effect of product patents by companies (though the effect of introducing product patents would be quite less in general, as seen earlier), some indications of the process patents are available. In pharmaceuticals, we have not been able to estimate the percentage of drugs and drug formulations under process patents but total patents in drugs and pharmaceuticals²⁸ is 9.31 per cent of total patents sealed in 1986-87. But it has been stated

that major percentage of the process patents in this sector have been granted to foreigners.²⁹ In fact percentage of patents to foreigners in foods, drug and medicines is 74.8 per cent in 86-87 and above 70 per cent since 74-75.³⁰ Of the 75 per cent market share as on year-end 1989 about 35-40 per cent is by MNCs in drug formulations (in 1989-90).³¹ Since most of the important MNCs have been included in this list, the remaining 25 per cent cover mainly the Indian companies and that too small companies. Thus about 60 per cent of the market share in drug formulations is with the Indian companies and the Indian companies are a major force to reckon with. As can be seen in Table 20, in our sample of companies covering about 53 per cent of total market share, MNCs with 33 per cent market share have been granted 407 patents between the years 1972-1989, while the Indian big companies with 16 per cent market share have only 59 patents (of which 41 patents have been granted to the two public sector companies). Though our sample is not a representative sample giving representation to different groups of companies based on the share of these groups to total market share, and though we know that it is the value of sales of patented items which is the real indicator, rather than the number of patents, the results at least indicate the following:

(1) The patents granted to big Indian companies especially private companies are surprisingly low. This seems to be a reflection of their poor R and D effort.

(2) While the MNCs seem to dominate in terms of process patents, four small companies have 24 patents, which seems to be relatively higher compared to the big Indian private companies. Of course, we do not know the type of relationship of small companies given here with the big companies or MNCs. While it is known

TABLE 16: PRICES AND PRICE INDICES OF SELECTED INDIAN DRUGS

Drug/Dosage	Brand Name	Prices (in Rs)

small-scale companies,³² the benefits due to patents to these companies may also be cornered by MNCs due to such arrangements. Table 20 also shows that a substantial number of patents granted to Indians are actually in the name of the parents of the MNCs operating in India, which in effect reduces the number of patents granted to Indians. Thus in process patents, the importance of MNCs can be seen. But a note of caution is needed here. Table 21 gives the percentage of pharmaceutical sales to total sales of some MNCs and Indian companies for which data are available. The percentage in the case of MNCs is very small, while for Indian companies it is very high, at even 100 per cent in one case. In the light of this fact, we can infer that a major portion of the patents granted to the MNCs are for non-pharmaceutical items and in the case of the Indian companies, it is mainly for pharmaceuticals. So ultimately even process patents granted to MNCs in pharmaceuticals may not be really high.

In Table 22 the profitability ratios of selected MNCs and Indian companies are given. The different profitability ratios are broadly similar in the case of total MNCs and Indian companies, and in the case of most of the companies profits to net worth indicators are quite high, while profits to sales indicators are quite low. Here again, for reasons explained earlier profitability of Indian pharmaceutical companies reflect profitability in pharmaceuticals, while profitability of foreign companies reflect profitability in non-pharmaceuticals. Even imports of raw materials to total sales and dividend remittances to sales are not high and the possibility of disguising profits in these forms by MNCs seems to be less. While there is truth in the argument that profitability to sales in pharmaceutical sector is quite low, we cannot argue (as is being currently done by many) that the profitability in this sector should be allowed to be as high as in other sectors by decontrol of prices. We should note that this is a sector affecting social security and many developed countries are giving medical-care free of cost or at concessional rates and India should not allow prices to rise beyond permissible limits. Moreover, profitability to net-worth in these companies is quite high and is comparable to profitability to net worth in other sectors.³³ Earlier we had noted that there is no need to fear product patents. Since we do not have any estimate of the value of pharmaceuticals under process patents as a percentage of total value of pharmaceuticals in India, we cannot be very sure of the extent of the impact of strengthening process patents in India on the pharmaceutical sector.

Drug/Dosage	Brand Name	Prices		
		1990	1991	1993

Note: The figures in parenthesis are index numbers.

Source: MIMS India (various issues).

However, strengthening process patents will mainly involve the following aspects, which are likely to affect the pharmaceutical sector. (1) Duration of the patents granted; (2) Considering imports as tantamount to working of patents in the patents granting country; and (3) Reversal of the burden of proof.

While the first issue can be allowed to be bargained upon, if needed with a quid pro quo from developed countries in the issue of Multi Fibre Agreement (MFA) (which we will discuss in Section IV), the second aspect can never be accepted as it would adversely affect the Indian drug industry, making it lose the gains already done. Even when the production is undertaken by MNCs, it should be undertaken in India. Otherwise, not only will the Indian drug industry suffer directly, but also the higher linkages of this sector will be reaped outside India as we will see in the next sub-section. In our zeal to cleanse the old system, we should not throw away the baby with the bath water. However, benefits to the Indian companies should be given in the form of tax benefits,³⁴ special benefits for exports which has been used well by Indian companies *vis-a-vis* foreign companies,³⁵ benefits for R and D investment, etc. As noted earlier, R and D investments in India in pharmaceuticals is very low by international standards. The exact break-up is not available to us. On the whole, while decontrol of prices has to be done judiciously, the Indian pharmaceutical sector including the public sector companies should be strengthened by other measures suggested above. Further the Indian pharmaceutical industry should shift more to the production of drugs which are off patent. In fact in the US the sales of generic drugs has increased from 9.2 per cent in 1980 to 19.1

in 1991³⁶ and definitely India should move more towards the production of generic drugs.

Effect on Other Sectors via Linkages: The drugs and pharmaceuticals sector will also affect the economy through linkages of this sector with other sectors. The study of Prasad A C P³⁷ shows that medical health has a high backward linkage effect. This sector falls in the IV classification of Chenery-Watanabe, i.e. high backward and low forward linkages. The high backward linkages of this sector imply that other sectors supplying inputs to the medical health sector will be affected greatly when the medical health sector is affected. But we should remember that pharmaceuticals form a small percentage of total medical care and also that the effect of backward linkages hold good here as far as the growth of other sectors are concerned. However, in the case of price effects, the changes in prices of other sectors will affect the drugs and pharmaceuticals rather than vice versa. The price effect of strengthening the patent system of pharmaceuticals in India therefore does not affect much the other sectors, while the strengthening of patents or any other changes in other sectors can greatly affect this sector via the linkages (assuming however that the linkages of the medical health sector is representative of the linkages of the drugs and pharmaceutical sector, which forms a part of the medical health sector). But if growth of the pharmaceutical sector is adversely affected due to strengthening the patents regime, then it will have an adverse effect on other sectors due to the high backward linkages. This however will not happen just by accepting product patents in pharmaceuticals. However, if the clause that "importing is tantamount to working the patents

in the patent granting country" is accepted while strengthening the patents regime, then the pharmaceutical sector will be affected adversely as the high backward linkages of this sector will be reaped outside the country. Devoid of this clause, strengthening the patents regime will not have much impact on pharmaceuticals via linkages.

Effect on Technology: At present, we do not intend to deal in detail with this aspect, but only state that, while strengthening of patents regime can harm the dissemination of technology, in the present situation, when all countries including communist China have strengthened their patents regime (especially they have accepted product patents) and our dependency on developed countries, especially the US for technology is increasing, refusal on the part of India to strengthen the patents regime will definitely affect the flow of latest technology and the quality of drugs. This adverse effect can be mitigated only if the Indian companies, including the government companies devote a larger amount of resources for R and D and identify good substitutes which are off patent. While as such the investment on R and D in drug industry is a poor 2 per cent of its turnover in India compared to 12 per cent in the international drug industry,³⁸ to further invest on R and D and mitigate the above mentioned effects the Indian companies will further emphasise their long-standing demand for decontrol of drug prices, which if done without much care will adversely affect the interests of consumers.

Effect on Balance of Payments: The balance of trade of India in drugs and pharmaceuticals is positive as can be seen in Table 23. The balance of payments of figures including non-trade items like

Notes (1)P Patented, NP = Not Patented, NA = Not Available, and D = Drugs under Price Control

Source Calculated by us by using (i) MIMS India (various issues), (ii) IDMA Annual Report 1992, (iii) Drugs Under Patent 1989 edition, Published by FOI services, USA

payments/receipts of royalties, technical know-how fees, etc, of the pharmaceutical sector as such are not available. The companywise balance of trade and balance of payments figures are not dependable as firstly, we have data only for few pharmaceutical companies and secondly, because some pharmaceutical companies especially the MNCs are more involved in production of non-pharmaceutical items. The strengthening of the patents regime

on balance of payments will depend on the type of strengthening of the regime and the way the Indian companies respond to the challenges. If it is merely accepting product patents, the effect will be less but if the clause of considering imports as tantamount to working the patents in the patent granting country is accepted, then the effect on balance of payments would be very high. While accepting product patents and furthering the

flow of technology and qualitative drugs can help our exports, accepting 'imports as tantamount to working patents in India' will not have any positive effect on balance of payments.

The above discussion highlights the fact that while India has to follow a judicious, price decontrol policy, it need not fear strengthening the patents regime in pharmaceuticals by accepting product patents in pharmaceuticals. However, there are

controversial issues like "considering imports as tantamount to working the patents in the patent granting country" and "reversal of the burden of proof". One possible danger is that the drugs not to be patented in the WHO list may slowly be forced to be patented. However as of present, this danger does not exist and the

TABLE 18B: DRUG PRICES: AN INTER-COUNTRY COMPARISON, 1986
(Price to the consumer in Rs)

Name of the Drug	India	UK
Chloramphenicol (antibiotic)	6.87	21.30
Metronidazole (anti-diarrhoeal)	2.76	25.54
Ferrous Sulphate (anti-anaemic)	8.46	12.03
Ibuprofen (analgesic)	6.13	7.67
Propranolol Hcl (Anti-hypertensive)	48.78	70.95
Salbutamol (anti-asthmatic)	1.11	4.57
Nifedipine (cardiac drug)	6.00	29.59
Cimetidine (anti-ulcer)	7.96	35.59

Note : Even if allowance is made for the 15-20 per cent increase in consumer prices as a result of DPCO 1987, Indian prices still compare very favourably with prices in other developing countries where also prices have gone up since 1986.

already competitive Indian drug industry can cope up in the case of any eventuality. Thus the basic issue here is not whether India should strengthen its patents regime in the pharmaceutical sector, but how it should strengthen it. To this issue, we will turn our attention in the next section.

IV

Modus Operandi of Strengthening India's Patent Regime

Our analysis in the previous section has shown that India need not fear strengthening its patent regime in the pharmaceutical sector by introducing product patents and in Section II we have seen that India's increased dependency on the developed world in general and on the US in particular and the fall of the Soviet Union has made it increasingly necessary for India to toe to the general line followed by the developed and other developing countries. In this situation and in the light of our study, we will see what changes India can make without forsaking its interests.

At the outset, we would like to make three things clear.

(1) We are not of the opinion that India's Patent Act 1970 was not useful. In fact, we are of the opinion, that it was useful and helped the Indian pharmaceutical sector to be competitive. But changing this Patents Act, now in a way that will strengthen the patents regime, need not necessarily be harmful for the Indian pharmaceutical sector.

(2) The fact that we advocate strengthening of the patents regime in the pharmaceutical sector, does not automatically imply that the same holds good for other sectors of the economy and for other countries at present, even in the pharmaceutical sector. This needs sector-specific and country-specific studies.

(3) The fact that we are of the opinion that the patents regime in the pharmaceutical sector of India should be strengthened, does not automatically imply that we should accept all the conditions put forth by the advanced countries or by Dunkel in his Draft Text.

The second aspect is beyond the scope of this paper and the third aspect is the subject-matter of this section.

ISSUES INVOLVED IN GATT NEGOTIATIONS ON TRIPS

There are many important issues involved in the discussion between developed and developing countries on strengthening the patents regime.³⁹ Here, we will consider only those issues related to pharmaceutical sector in the Indian case. They can be grouped under the following heads:

- (1) Issues relating to policy matters.
- (2) Issues relating to implementation and administration.

The main issues related to policy matters in the negotiations on strengthening the patents regime in the Pharmaceutical sector, especially for India are: (1) Granting product patents, (2) Duration of the patents, (3) Considering imports as tantamount to working patents and continuing non-exclusive compulsory-licensing, (4) Reversal of the burden of proof and (5) Pipeline protection.

The main opposition against granting product patents in the pharmaceutical sector by countries like India, was the fear that it would increase the prices of pharmaceuticals and that domestic production would suffer. We have seen that there is no need to fear the introduction of product-patents on these counts. What we should guard against is that under any circumstances the non-patentable drugs (especially the ones in the WHO list) are not included under the list of patented drugs. One should also be aware of the fact that developing countries including India's close and potential competitors in Asia like China have accepted product patents. While there is no need to fear granting product patents in pharmaceuticals, India need not hesitate, but take the initiative and accept granting product patents in pharmaceuticals in order to bargain against such patents in other sectors, where such a thing should not be done and/or for bargaining on other issues in the pharmaceutical sector.

The duration for which patents are granted in India's pharmaceutical sector is seven years from the date of application or five years from the date of grant, whichever is shorter while it is 14 years in most of the other sectors. The criticism against the short duration of patents in India in general and pharmaceuticals in particular is that the time is too short for the patentee to gain the fruits of his inventions, as R and D is very costly in this sector and it presently takes a minimum of five years for a patent to be granted so that the effective term gets reduced to only about two years. For introducing a new drug it takes about that long to conduct clinical trials by which time it is all over.⁴⁰ The arguments against a longer patent term in general⁴¹ are that if a longer patent term is given the patentee may not have any incentive to start production as soon as possible... the lead time between an invention and its commercialisation is getting shorter... and due to technological or economic obsolescence most of the patents do not last their full term. The shorter duration of patents especially in the pharmaceutical sector is justified on the grounds that it affects

the man and is a social security issue.

Let us now put the facts squarely. The duration between the date of application and grant of patent is rather high in India. Table 24 shows that for the patent applications to become fructuous in the case of all countries together and also individually, it took two-three years in the period 1970-79, with three years being the modal year while it became three-four years in 1980-88 with 4 years turning out as the mode. Though we do not have the frequency ratios particularly for pharmaceutical sector, there is no reason to believe that the patents were granted quickly in this sector. Therefore there is truth in the argument that the effective years for patents is very less (usually three years if we follow the results in our table). With only three years left, it would be difficult to popularise the product and recover the cost on R and D, leave alone gaining profits forcing the pharmaceutical companies

to shift to production of cosmetics and related items. While the optimum duration for a patent is debatable and depends on the trade-off between the costs of monopoly and provision of incentives, there is definitely a need for increasing the effective term. This can of course be done by suitable administrative measures without touching policy measures. If a patent is granted within one year of application, even though one doubts whether patent office in India can be activated to such an extent, then also the effective period would only be five years, as under the Patent Act 1970, patents in pharmaceuticals can be granted seven years from application or five years from granting the patents, whichever is shorter. While we feel that there is no harm in India granting a higher duration, it can fix the exact number of years for the pharmaceutical sector (say around 8-14 effective years) for bargain, though not 20 years as given in Dunkel Draft Text (DDT).⁴² In fact, it

has been reported that the IDMA which has been opposing the strengthening of patents regime has been reported to have accepted that the life of a patent for a pharmaceutical product can be extended from the existing seven years to a uniform 14 years as in the case of other products and industries.⁴³

In the Dunkel Draft Text nowhere has it been mentioned that imports are tantamount to working patents in the patent granting country and also people like Chidambaram⁴⁴ say that the text does not warrant such an interpretation (i.e., imports are tantamount to working patents). Though the text says that imports cannot be allowed by others without the consent of the patentee, this necessarily does not mean that the patentee can himself import it. Yet the draft is slightly tricky in this issue and as stated by Chidambaram,⁴⁵ the US and less so European countries and Canada, clearly regard the text as meaning that importation is equal to local

working, that it is a substitute for local manufacture. Developing countries have strongly argued against the non-working of patents stating that if a patent is only used for import purpose, non-nationals can exercise monopoly power over the protected market. Moreover there are no benefits for the importing developing country in the sense of extra production facilities.⁴⁶ Industrialised countries have argued that "it may be very uneconomical for a company to exploit its patent in all countries where the patent is recognised. Supplying foreign markets from a central production plant could be far more cost effective. Industrialised countries perceive prevention of the unauthorised copying of a protected product or process in the importing country one of the core functions of the patent. They therefore challenge the above-mentioned definition of working of a patent by stating that working also includes importing the product".⁴⁷ Our study has shown that even if product patents are granted and even if MNCs manufacture the commodity using the patented technology, the production should take place in India and not outside India. If imports are considered tantamount to working patents in the country then firstly, the very purpose of patenting for transfer of technology will be lost, secondly, the import bill will be higher leading to adverse balance of payments; and, thirdly, the high backward linkages of the pharmaceutical sector will be reaped outside the country. Thus, on no account can India accept this clause at the present stage of its development. We cannot accept the argument of Chidambaram that one way of addressing this concern is to provide for compulsory licensing for non-commercial public use without consulting the patent holder.⁴⁸ This is because "compulsory licences are not exclusive and the licensee is not put in a monopoly position and therefore lacks a reliable basis for investment and also compulsory licenses do not include know-how".⁴⁹

One point to be noted here is that the developing countries advocate exclusive compulsory licensing, wherein the patentee loses the right to import and to market the product in the country, as he did not work the patents within a period of three years from the date of the sealing of the patent and was not able to give genuine reasons for it. Here, of course, flexibility is called for and we should not exclude the patentee from working the patent even when a compulsory licence is issued. While the patentee would not have been debarred from working the patent if he were to work it before the stipulated date, there is no need to be hard on him and prohibit him from working the patent after the date and he should be allowed

to compete with others for whom compulsory licences have been issued. What however has to be guarded against is the imports by the patentee. Here the same policy of not considering imports as working of patents should hold good and thus non-exclusive compulsory licence devoid of imports can be advocated in such cases.

Another issue hotly contended between developed and developing countries is the question of 'reversal of the burden of proof. The advanced countries contend that if the competitor did really use an alternative process, he is normally the only one able to give evidence for that and therefore the burden of proof should be on the alleged infringer. This means that the latter must show that he has used an unprotected process to manufacture the challenged new product. The developing countries however contend that reversal of the burden of proof is at odds with basic legal principles in many countries where it is up to the plaintiff to provide proof and evidence; it relieves the (usually foreign) patentee from producing proof of infringement of his process patent and gives him a lot of coercive power and third parties will become less willing to invent or invest in alternate processes in developing countries because they might be sued for infringement.⁵⁰ According to Chidambaram⁵¹ "the problem of reversal of burden of proof has been addressed in India by pointing out to Section 106 of the Indian Evidence Act, which already provides that when a fact is within the special knowledge of a person the burden is upon that person to prove that fact". In this context one has to be quite careful as the Dunkel Draft Text is a little mischievous when it says in Article 47: Right of Information that 'Parties, may provide that the judicial authorities shall have the authority, unless this would be out of proportion to the seriousness of the infringement, to order the infringer to inform the right holder of the identity of third per-

sons involved in the production and distribution of the infringing goods or services and of their channels of distribution.⁵² Under this clause not only the burden of proof lies on the alleged infringer, but also he has to inform the identity of other possible infringers and the burden of proof lies on these third parties as well! This can result in a lot of mud-slinging and some parties can become scapegoats sometimes at the instance of the patent holder, who may be a multinational with his own vested interests. In this context one can broadly agree with the views of Pravin Anand⁵³ who says that "as regards the burden of proof, it is the existing law of India that the plaintiff, in an infringement action, would discharge his preliminary burden by stating certain basic facts and the onus of establishing recipe details would be on the defendant who alone has special knowledge of them". We feel that the plaintiff should produce basic evidence for the infringement and a high penalty should be charged on him in case his allegation proves to be false. The alleged infringer should also be asked to supply details before the case is decided. However this should be applicable only for companies or producers who market the product with the intention of earning profits and not on any single individual (or research organisation) who may infringe with non-profit motives like basic research. Otherwise an extension of this principle to copyrights in software will lead to undue difficulties for individual users of software purely for research purposes. Again our view holds good only for pharmaceutical sector and need not necessarily hold good for other sectors like agriculture and software where the situation is quite different and doubts still exist as to whether the plaintiff himself is an alleged infringer of the technology which he might have modified. This is because as said by Narasimhan 'the so-called 'inventions' always ride piggy-

once, on prior occasions and frequently not as programming techniques are published, but are transmitted by word of mouth, or presentations at conferences, making it difficult to identify the true inventor.³⁴

The Dunkel Text says³⁵ that no party is obliged to apply the provisions of the agreement before the expiry of a general period of one year following the date of entry into force of this agreement. They are also entitled to delay for a further period of four years from the date of application. Thus all countries get a transition period of five years. Further the text also says that the developing countries extending product patent protection to areas of technology not hitherto protected can get a further five-year period transition. Thus total transition period for them extends to 10 years. Least developed countries can get a transition, period of 11

years. However, in the course of the GATT negotiations, the US is insisting on 'exclusive marketing rights' for pharmaceutical and agro-chemical products. This is called 'pipeline protection'. Thus as observed by Jeroen van Wijk and Gerd Junne.³⁶ "In spite of transition period, patent applications may be filed for pharmaceutical and agro-chemical products as from the date of entry into force of the agreement. These applications remain in a 'black box' until the expiry of the transitional period. In respect of the products covered by these applications, there will be a five-year period of marketing exclusivity after marketing approval, while awaiting the delayed grant of the patent. The exclusive marketing rights reduce the transition period for the protection of the pharmaceutical and agro-chemical products to zero"! Chidambaram³⁷ has

argued for a 10-year clean transition period for countries like India without intrusion by what is called pipeline protection before they come under the new patent regime. He also quotes the example of the issue of Multi-Fibre Agreement (MFA) where "the advanced countries want a 10-year transition and during that period of 10 years the argument is back loaded, the integration percentage are inadequate and the coverage is sought to be extended to products which are not under coverage today". China which has made extensive reforms in its Patents regime, however considers that pipeline protection "does not conform with the principles of territoriality and independence in respect of the Paris convention. It will put the technically backward developing countries in disadvantageous circumstances".³⁸ While we have no reason to argue against

this view and while we are aware that the question of 'pipeline protection' has not even been mentioned in the original text of Dunkel, there is also the fact that we have nothing to fear in accepting pipeline protection in pharmaceuticals as we have seen that the effect of introducing product patents in the case of pharmaceuticals in India is not much and a five-year pipeline protection will not make much of a difference in this regard especially when the patents of most of the American drugs are expected to expire in 1990-95, and the Indian companies have already identified their 'target drugs' and are on the process of drawing up plans for an assault on the US market when the patent concerned expires.³⁹ However we need not hurry in this issue and can use it as a bait in our negotiations to get the pipeline protection granted to developed countries under MFA removed or lessened.

TABLE 23: TOTAL VALUE OF IMPORTS AND EXPORTS OF DRUGS AND PHARMACEUTICALS FROM 1973-74 TO 1988-89 AND 1989-90 (Value in Rs crore)

Year	Total Imports	Total Exports	Trade Balance
1973-74	34.16	37.33	3.17
1974-75	46.90	43.14	-3.85
1975-76	46.02	42.27	-3.75

Source: IDMA, *Annual Report*, 1992.

There is the allegation against India that not only do its patent laws violate IPRA, but also that these laws are not properly implemented and consequently countries like the US are incurring heavy losses. Since the then USTR Carla Hills herself had said that granting product patents will affect only 5 per cent of Indian drugs, the losses to the US are presumably not due to this factor. Then the implementation of the process patents which we have granted seems to be the most important reason leading to the alleged losses. But here also there is no clear-cut picture, as people like Bhai Mohan Singh⁴⁰ have said that American companies estimate losses from the very basic stage and not the spin off stage. Further, as also pointed out by Bhai Mohan Singh⁴¹ "when the advanced countries like the US, Japan and EC countries were in the stage of development India is in today, their laws and implementation were not any better, possibly worse". However, there are certain aspects related to implementation and administration that needs to be attended to:

(1) The time between applying for a patents and granting the patent should be reduced. This is good from India's point of view as well, as, having decided to grant patents, it is better to do it quickly, in order to get the benefit of the new technology quickly. So the administrative machinery has to be geared up to meet the needs and a complete face lift has to be given to the Patents Office and its working. In fact, the highest office sanctioning transfer of technology to India seems even to lack in giving a semblance of the latest technology and expertise which it is helping to transfer to India.

(2) In the case of wide scale infringement of the patents granted, while the government should take action and even co-operate with the patent holder in bringing the infringer to book, wherever possible, the government should also negotiate

with the patent holder to charge some 'pardon-amount' and allow the infringers to use the patented process or product of popular drugs and medicines which have been copied on a wide scale.

(3) Confusing clauses in the law which make administration and implementation of patents difficult have to be removed or modified e.g. as mentioned by Pravin Anand,⁴² "There are horrendous provisions such as Section 43, by which an opposed patent cannot be sealed in appeal even if the appellate court refuses to stay sealing. Thus in a case relating to Orissa cement, even through the Delhi High Court refused to stay sealing, the controller considered himself bound not to seal and despite a provision in the act that the appeal should be heard within one year, 12 out of the 14 years have already gone by and the appeal is still pending". Similar cases may be found even in the pharmaceutical sector. Thus a serious attempt should be made to streamline the procedure of the Patents Act and the working of the patent office to make the patent right a meaningful one.

(4) While the list giving what are not inventions can be pruned as opined by Daruwalla⁴³ certain conditions are not needed e.g. licensing of related patents⁴⁴ which says that "at any time after the sealing of a patent any person who has the right to work any other patented invention either as a patentor or as a licensee thereof may apply to the controller for the grant of a licence of the first mentioned patent on the ground that he is prevented or hindered without such licence from working the other invention efficiently or to the best advantage possible". These issues should be settled before sealing the patent. Moreover the aggrieved parties can lodge the complaint before the patent is sealed within a given stipulated time.

Thus the Patents Act has to be carefully modified to make its implementation and administration smoother and efficient.

TABLE 24: FREQUENCY TABLE OF THE YEARS TAKEN FOR PATENT APPLICATIONS TO BECOME FRUCTUOUS

OTHER ISSUES

Some other issues can be listed below:

(1) Whether negotiations should take place under the auspices of GATT or WIPO.

(2) Whether unilateral action can be allowed.

(3) Whether India should join the Paris convention.

WIPO vs GATT: This was an important issue when the TRIPS negotiations were beginning. But now even those people who have advocated that negotiations should take place under WIPO seem to have lost interest in pursuing their idea. While WIPO is considered to represent the interests of developing countries and GATT those of advanced countries there is no need to make much of a fuss on this issue now and the negotiations can be completed under the GATT.

Unilateral Action: The US has been resorting to unilateral action by involving the Special 301 provisions of its trade act and have targeted many countries including India for alleged shortcomings in their IPP legislations. The Special 301 provisions require the USTR to negotiate specifically on IPP with countries whose IPP standards are prejudicial to American trade interests. This unilateral action is taken side-by-side with the pressure applied in the multilateral negotiations under GATT. In fact the US is threatening to link the issue of IPRs with GSP (General Scheme of Preferences). We are of the opinion that no country should be allowed to follow such unilateral actions while negotiations under the multilateral forum of GATT are underway. The question of unilateral actions should come only if GATT talks fail. Of course the GATT negotiations should be completed speedily and successfully to avoid such embarrassments. This needs a positive outlook and sincere effort on the part of both the developed and developing countries.

Joining the Paris Convention: There are people who feel that 'it is high time that India became a member of the Paris convention of 1883 as a lot of foreign technology is accidentally lost, as owners harbouring a wrong impression do not apply in India prior to publication and by the time the fact is discovered, it is too late'.⁶⁵ But there is also great opposition by economists in India joining this convention. The disadvantages for India in joining the Paris convention and the advantage of the Indian Patents Act has been summarised by Mehrotra⁶⁶ and has been given in the Statement.

While some of the disadvantages in the list mentioned above can no longer be considered as disadvantages, in the light of our study, there are some disadvantages

STATEMENT: COMPARATIVE LOSS-BENEFIT ANALYSIS FOR INDIAN PHARMACEUTICAL INDUSTRY IN JOINING PARIS CONVENTION

Indian Patents Act Advantages	Paris Convention Disadvantages
To People of India <ol style="list-style-type: none"> 1 No product patent on drugs, foods etc, and hence can be available at lower costs. 2 Revocation of patents in public interest. Government can ensure indigenous production in public interest. 3 Rigorous provisions of compulsory licensing. 4 Power to government to use inventions (for people). 5 Government can import patented drugs (public use). 	<ol style="list-style-type: none"> 1 Patented products can be imported except at exorbitant monopoly prices. 2 Patented products cannot be produced in the country except with the premission (licence) from the patentee (exorbitant cost).
To Industrial Development <ol style="list-style-type: none"> 1 Drugs not being under patent can be indigenously produced. 2 Compulsory licensing; revocation of patent in public interest; power of government to use invention—even licence to third parties—indigenous production 3 Can import drugs/technology for indigenous production from wherever available (cheaper). 4 Can also export technology/patented products to non-PC countries. 	<ol style="list-style-type: none"> 1 Compulsory licensing very difficult and hence monopoly market of MNCs. 2 Effective protection against unfair(?) competition by indigenous industry (helps maintain monopoly of MNCs) 3 Cannot obtain technology except under licence from patentee (exorbitant cost). 4 Can't export patented products/technology. 5 Can't import patented bulk/technology. 6 Difficult to break blocking/comprehensive repetitive patents.
S and T Development <ol style="list-style-type: none"> 1 Scientists can patent incremental innovations/inventions. 2 Indian scientists can still continue to obtain patents anywhere in the world and get same rights available to others. 3 Because of bilateral agreements and membership of WIPO, etc, can still get all information on patents. 	<ol style="list-style-type: none"> 1 Indian scientists can't patent because of (6) above. 2 Restriction in industrial/technological development doesn't provide climate for further S and T development.

Source: Mehrotra N N: 'Patents Act and Technological Self-Reliance: The Indian Pharmaceutical Industry', *Economic and Political Weekly*, Vol 24, No 19, May 13, 1989, p 1063.

like the difficulty in break blocking/comprehensive repetitive patents which also hinders the development of S and T. Besides, the issue of joining the Paris convention can be decided only after making sector-specific studies of other sectors. Moreover if the reforms suggested by us are followed, then the question of joining the Paris convention will be less important from the point of the pharmaceutical sector.

V Conclusion

In this paper we have made the following facts clear:

(1) India's dependency for technology on the US in particular and the developed countries in general has been increasing.

(2) In the pharmaceutical sector, India is quite competitive and the prices will be affected mainly due to decontrol of prices rather than introducing product patents

(3) While there is no need to fear granting product patents by India in the pharmaceutical sector, considering imports as tantamount to working patents cannot be accepted; duration of patents can be left for mutual bargaining and pipeline protection can be used as a bait for cancelling or reducing pipeline protection of developed countries in sectors like textiles.

(4) The administration of the patents has to be streamlined and Patents Act has to be modified.

(5) While unilateral action by the US should be discouraged when the multilateral negotiation are making headway, joining the Paris convention is not an important issue from the point of view of the pharmaceutical sector if the measures suggested by us are accepted.

(6) Greater importance to R and D and substituting non-patented drugs for patented drugs are called for in the pharmaceutical sector.

In conclusion we can say that the

patents regime has to be strengthened on the lines suggested by us to promote greater transfer of technology and join the process of international harmonisation without forsaking India's interests. Sector-specific studies for other sectors are the need of the hour.

Notes

[Our sincere thanks to S K Goyal, Chalapati Rao and other members of the ISID and Gopal Krishna Tadas of RIS, for their help and suggestions. But the responsibility for any errors is ours and the views expressed are our personal views which need not necessarily reflect the views of the ISID.]

Anti-Arrack Agitation of Women in Andhra Pradesh

D Narasimha Reddy
Arun Patnaik

There is a determined bid by the state, particularly the police, the contractor's henchmen and the political parties to dissipate the anti-arrack movement in Andhra Pradesh. The movement has not merely raised the women's question as is being portrayed by the press and a section of the intelligentsia, but has targeted its attack on the nexus between the politicians, police and arrack contractors.

I

BEGINNING in the early August 1992, in a remote village of Dubagunta of Nellore district in Andhra Pradesh, the agitation by women protesting against arrack auctions and demanding ban on the sale of arrack spread to almost all districts of the state. The movement against the sale of arrack started in north Telangana districts like Warangal, Karimnagar and Adilabad at the behest of the CPI(M) (PWG in particular and other groups) but attempts were made to suppress it by the police intervention which went to the extent of selling arrack not only under police protection but even in the police stations. Notwithstanding the repression, there is a widespread people's ban on arrack sales in these districts and no auctions could be held for as many as 1,739 arrack shops in 1990-91 in Warangal, Karimnagar and Mahaboobnagar districts. While the CPI(M) sponsored ban on arrack sales was met by the state with brutal attacks on agitating women, apparently the movement started spontaneously but in fact as a result of a combination of social, economic and political factors, was initially responded by the state with a kind of indifference under a cynical hope that it would fizzle out. This attitude of disdain bordering on scorn could be seen from even the response of the English press. The movement was about two weeks old by the time newspapers like *The Hindu* and *Indian Express* started reporting. Starved of any important issue that would adequately capture the attention of the people, a ride on the crest of which would be vote-spinning, the anti-arrack agitation provided a ready bandwagon to political parties like TDP. The National Front leader N T Rama Rao missed no time and converted the train journey to his film shooting locale in Araku Valley near Vishakhapatnam to address meetings by stopping the train even at unscheduled railway stations with scant respect to the inconvenience caused to other passengers. The CPI(M) celebrated its involvement in the movement by conducting a national seminar at Hyderabad through its front organisation Jana Vignana Vedika and

provided a common platform, where all the parties, except BJP, including the Congress(I) exhorted the need for ban on arrack and left. The anti-arrack agitation in Andhra Pradesh is threatened with dissipation because of state repression and attacks engineered by arrack contractors on the one hand, and on the other the gimmicks of 'major' opposition parties which are hardly involved with the movement at the grassroots level.

To understand the movement with a view to strengthen it, one must place the problem in its proper historical and social context. The second part of this note tries to provide the recent historical background on the issue of prohibition and the third part draws attention to the mechanisms of penetration of the liquor lobby into the political process denigrating the democratic fabric of Indian society. At the end an attempt is made to provide a policy outline as a response to the immediate context.

II

Prohibition as State Policy

The early British policy relating to liquor consumption, which was also inter-linked with excise revenue, was one of temperance and of restricting the consumption of intoxicating drinks. One of the earliest policy pronouncements dates back to September 7, 1905, which stated that their 'settled' policy was "to minimise temptation to those who do not drink and to discourage excess among those who do, and to a furtherance of this policy, *all considerations of revenue must be absolutely subordinated*" (emphasis added). The policy of regulation and of discouraging the use of alcoholic drinks in excess continued till 1921, when with the introduction of the first constitutional reforms, the movement towards prohibition gained strength and resolutions declaring that prohibition was the ultimate goal of excise policy were passed by several state legislatures.

Several state governments apparently took measures to minimise the consumption of alcoholic drinks by the enforcement of controls on their manufacturing

and distribution. But these measures do not appear to have had any salutary effect. In 1930-31 and 1932-34, as a part of the civil disobedience movement there was picketing of liquor shops and toddy booths. The enforcement of complete prohibition, figured as the first item in the national demands submitted by Gandhiji to the British government in 1931. He wrote in *Young India* in 1931, "... If I was appointed dictator for one hour for all India, the first thing I would do would be to close without compensation all liquor shops, destroy all toddy palms such as I know in Gujarat, compel factory owners to produce human conditions for their workmen and open refreshment and recreation rooms where these workmen could get innocent drinks and equally innocent amusements... For the loss of revenue from drinks, I would straightaway cut down the military expenditure..."

The provincial autonomy of 1937, which brought the Congress into power in several states, brought life to the programme of complete prohibition. Provinces like Bombay and Madras started implementing prohibition policy in stages. But the outbreak of the second world war and the consequent resignation of Congress governments in the states put a halt to the prohibition policy. Prohibition was lifted in all the states and revenues from excise soared high during the second world war period, partly because of the inflationary conditions and partly owing to popular ministries in the states.

The second world war was an important turning point which brought the liquor revenue to the fore. It was during the second world war that revenue from excise, an indirect tax, became the single largest source, bypassing the land revenue, a direct property-based tax. In Bombay state, excise receipts which amounted to Rs 2.8 crore in 1938-39 increased by 1946-47 to Rs 9.7 crore, the single largest source of tax revenue yielding about 34 per cent of the total tax revenue. In Madras state, excise receipts increased from Rs 3.8 crore in 1938-39 to Rs 16.8 crore in 1945-46, against Rs 8 crore from land revenue. *Notwithstanding the growing revenue presence of the excise duty,*

both the states introduced prohibition as soon as popular ministries assumed office in 1946. In Bombay a decision was taken to bring about complete prohibition in the state by gradual stages within three years from April 1, 1947. Progressive reduction in consumption was ensured by: (1) Closure of excise shops for 2 days in 1947-48, 3 days in 1948-49 and 5 days in 1949-50, (2) Progressive reduction in the number of shops, and (3) Reduction in the strength of liquor in the case of country liquor.

A separate law called the Bombay Prohibition Act 1949 was enacted and complete prohibition was brought about in the state with effect from April 6, 1950. Similarly in Madras state soon after the resumption of power by the popular ministry, the policy of prohibition was revised and by 1948-49, it was extended to all the districts.

Prohibition as an important state policy figures in the Directive Principles and Article 47 which directs that the states "shall endeavour to bring about prohibition of consumption, except for medicinal purpose, of intoxicating drinks and of drugs which are injurious to health".

The task of extending prohibition as a national policy was considered as an important welfare measure and the responsibility for working out the modalities of the implementation of the policy was assigned to the Planning Commission. The Planning Commission appointed the Prohibition Enquiry Committee in 1954 [Shriman Narayan committee 1954] which submitted the report in 1955, was very optimistic about the adoption of prohibition as national policy and made a number of recommendations for a time-bound implementation. Some of the important recommendations are: (i) that prohibition should be regarded as an integral part of the second five-year plan, (ii) that the target date for completing nationwide prohibition should be April 1, 1958, (iii) that in states which were yet to make a beginning and in the wet areas in partial prohibition states, from April 1, 1956, there should be stoppage of drinking in hotels, bars, restaurants, messes, clubs, cinemas and in parties and functions, (iv) that there should be prohibition committee in each district and at the village and mohalla level, (v) that the excise duties on narcotics and intoxicants collected in the states are highly iniquitous, regressive and anti-social and this kind of levy has no justification to exist in a progressive tax system and should be wiped out at the earliest, (vi) that the union government would give adequate assistance to those states which depend on excise for a considerable part of their revenue to introduce prohibition in their areas, and (vii) that a clear-cut statement may be issued by the union government to the effect that pro-

hibition has become a national policy.

As a sequel, the policy of prohibition was discussed as a non-official resolution by the Lok Sabha which passed the following resolution on March 31, 1956:

This house is of the opinion that prohibition should be regarded as an integral part of the Second Five-Year Plan and recommends that the Planning Commission should formulate the necessary programme to bring about nationwide prohibition speedily and effectively.

The Second Five-Year Plan included, as part of its 'social welfare services', prohibition as an essential item of social policy. It emphasised that in the consideration of any basic social policy, financial considerations, although of great practical importance, are not to be treated as decisive in character. It suggested the following steps to be taken by the state governments in wet or partially wet areas:

(1) discontinuance of advertisements and public inducements relating to drink; (2) stoppage of drinking in public premises (hotels, hostels, restaurants, clubs) and at public receptions; (3) setting up of technical committees to draw up phased programmes with the object of (a) reducing progressively the number of liquor shops both in rural and urban areas; (b) closing liquor shops for an increasing number of days during the week; (c) reducing quantities supplied to liquor shops; (d) progressively reducing the strength of distilled liquor produced by distilleries in India; (e) closing of shops in and near specified industrial and other development project areas; and (f) removal of shops to places away from main streets and living quarters in towns and villages; (4) Taking active steps to encourage and promote the production of cheap and healthy soft drinks; (5) assisting voluntary agencies in organising recreation centres; and (6) including prohibition as an item of constructive work in national extension and community project areas and social welfare extension projects.

One important step taken during the Second Five-Year Plan was the setting up of the central prohibition committee by the home ministry and the committee met towards the end of 1960 to review the implementation of prohibition policy. Otherwise, the action taken by the state governments was not significant and the progress for the country as a whole was slow. One of the significant aspects of the Third Five-Year Plan was to emphasise prohibition essentially as a social welfare movement and recognition that if prohibition were to rest primarily on enforcement by the police and by excise staff, not much progress would be made.

The main reliance has therefore to be on: (a) the creation of a growing public opinion in favour of prohibition conceived as a social welfare measure in the interest

of the general mass of the people; (b) voluntary organisations, which should be given the necessary support and assistance by the government in carrying out social and educational programmes; (c) implementation of various development programmes undertaken by government agencies in education, health, social welfare, etc, with due emphasis on the significance of prohibition; and (d) availability in canteens of cheap and nutritious food and non-alcoholic beverages and encouragement of sports, and recreational activities on a group- and community-basis.

With a view to achieving greater progress in these directions, it would be useful to provide financial assistance to voluntary organisations for educational and promotional work among the people and also to give a measure of support to other activities which would assist the progress of prohibition.

Assigned with the task of devising the machinery and modalities for the introduction of prohibition as a national policy, the Planning Commission appointed in 1963 a study team on prohibition under the chairmanship of Justice Tek Chand. The study team submitted its report in 1964.

For anyone dealing with liquor problem in India, Tek Chand Report (1964) is a compulsory reading. Its informative and educative value is incomparable. The comprehensive report running into 1,265 pages in two volumes covers almost every aspect of liquor manufacturing, trade, consumption, consequences, the history of the movements against liquor in India as well as abroad, the problems and failures of prohibition law. The only striking deficiency, a reader of 1990s would find is the absence of discussion, except in passing remarks on the situation in individual states of the corrupting influence of liquor trade on the political processes. One may explain it away either as a result of the terms of reference being different or because of the liquor-politics nexus by the mid-60s not yet assuming such depths of degradation. Be that as it may. It need not detract one from the merits of the report.

The most important recommendations of the team include changes in the provisions of liquor laws, electoral disqualification of persons involved in liquor offenses, mass education and publicity, active role for voluntary agencies and *Nasha Bandi Lok Karya Kshetras* throughout the country and a four-phased programme culminating in total prohibition preferably by January 30, 1970. But it was a cruel irony that during this period what really happened was quite the reverse—prohibition was lifted in almost all states, except Gujarat.

It is very perplexing as to how such a comprehensive report like the one by

Justice Tek Chand met such a cruel fate. To unravel the mystery one should take into consideration the slow but sure changes in the nature of the emerging ruling classes, their social base and the compulsions of the coalition. Even as the Tek Chand study was being contemplated, the Uttar Pradesh government abolished prohibition in 11 districts where there was prohibition in 1964 but introduced certain dry days! Madhya Pradesh quickly followed suit. Mysore was the first state in the south to relax even its partial prohibition in 1964. Haryana scrapped it from April 1967 and Kerala did so in the same year. Orissa was the next to scrap prohibition in 1968. The Andhra area of Andhra Pradesh followed suit in 1969. Assam liberalised prohibition in 1970. Maharashtra revised its policy towards a permit system. And with the abolition of prohibition in August 1971 in Tamil Nadu—hardly a year had passed since Gandhi Birth Centenary, there was no major state save Gujarat where prohibition was in force.

All observers of India notice that the mid-1960s mark a clear turning point for worse in the economy, polity and even in social policy as could be seen from the fate of prohibition policy. Not only were the otherwise much acclaimed recommendations of the Tek Chand report put to cold storage, even the Planning Commission which included prohibition as a part of the welfare programmes of the second and the third plans, seems to have turned a cold eye. There is no mention of prohibition in the Fourth Five-Year Plan document or the Annual Plans that preceded it!

The reasons for such a complete reversal to the 'prohibition policy' are not far to seek. These were closely linked not only to the economic and political changes but also with the subtle but perceptible changes in the very nature of the ruling classes, and their support base and means as well as sources of power. Of this, the liquor excise revenue to the state and liquor contracts or illicit gratification to the ruling classes make the reversal of prohibition policy a political necessity and of course a social scourge. Liquor emerges as a major source of revenue without displeasing the rich. What is more startling are the consequences. Let us first see how the turn around actually happened.

Ever since the formation of 'popular ministries' in the states in 1946, the pursuit of prohibition as a state policy was accepted but the action taken varied from that of complete prohibition in states like the then Madras and Bombay, partial prohibition in Uttar Pradesh and Madhya Pradesh, a policy of temperance in states like Bihar and West Bengal and no dry law in states like Rajasthan and erstwhile Hyderabad.

In most of the states which did not go in for prohibition, the policy of minimising liquor consumption through maximum excise revenue ended up only in raising revenue instead of reducing liquor consumption. By late 50s, even in a state like Andhra Pradesh, which had parts without dry law, were moving towards revenue maximisation, disregarding the very objective of curbing liquor consumption. The Andhra Pradesh prohibition inquiry committee report (1955) observed that "the objective of minimum consumption was not helped but vitiated by the objective of maximum revenue in which revenue was sought to be obtained from the poorest classes for being spent on society in general". The report of the Taxation Enquiry Commission (1955-56) also observed: "...it is thus clear that the aim of reducing consumption has come to be ignored, and that though half a century has elapsed since the policy was first adumbrated, no tangible result in the direction of reducing consumption have flowed from the manner in which it has been in operation so far". But it was yet another irony that this report of 1954 which produced recorded evidence on the failure of implementation of the dry law, instead of suggesting the ways and means of plugging the loopholes came out in favour of complete scrapping of the dry law! Needless to say that this committee had a mechanical administrative perspective devoid of either the history of such a measure in other parts of the world, or

the historical context within India or the welfare implications involved in the issue. For such an effort, one had to wait for the reports of Shriman Narayan and Tek Chand panels.

Now, let us return to the questions as to why there was a complete reversal by the end of 1960s in the implementation of a constitutional directive on prohibition as a national policy to which the government of India was committed by a parliamentary resolution? And with what consequences? Of course, the answer may not be available in the nature of causes separated from the consequences but in the dialectics of the consequences in the womb of the causes as well.

At this juncture, it may not be much of a digression to draw attention to the twin roles of the state in India. One is to keep the coalition of the heterogeneous dominant classes by catering to their needs and the other is to create a network of patronage through programmes that would serve as a thread that links the loyalty of the masses to the ruling classes. *Etatism* of this kind means that it is through the state that the ruling classes enrich themselves and it is through the state that they lay claim to the loyalty of the masses.

The strains of such a role aided by certain natural calamities became quite apparent by the late 1960s. The state's role as a mobiliser of resources and as an investor faced severe constraints. The state investment registered deceleration. There was a threat to its role as an agency to

legitimise the regime, the dominant coalition. Even the success of the green revolution in its early phase was throwing up its own contradictions as could be seen from mobilisation of farmers for higher prices and better terms of trade. The early avenues of public works contracts under the strain of resources were not proving adequate to 'harvest' their riches. In fact for the large majority of the land-based incomes are associated with 'harvesting' notions and there is no other use that can harvest profits as quickly as contracts to the repertoire of which the liquor contracts were added by the late 1960s.

Of the many factors, one that played a decisive role is the capacity of the liquor trade to quench the growing 'revenue' thirst of not only the states which were not willingly to displease the affluent by taxing their growing wealth and incomes but also of the ruling elite who were looking for easy and quick sources to enrich themselves as well as to finance their election expenses which were reaching scandalous proportions, incapable of being met by any hard-earned incomes or party-funding, however ingenious the mechanisms of mobilisation might be. It is interesting to note that company contribution to political parties was banned by legislation in 1970. State excise to the states and liquor contracts to the ruling elite or their henchmen made politicians to look upon prohibition as utopian and far from being pragmatic. This stink of pragmatism in the polity was spreading all over making a mockery of the democratic process. By late 60s and early 70s there was no shadow of doubt about the decadence and the entire political process was soaked completely in liquor largesse.

In 1973, Jayaprakash Narayan wrote:

...money, falsehood, corruption and physical force have combined to erode steadily the very meaning and substance of elections. Election costs have been growing by leaps and bounds, and cases have been reported in which single state assembly candidate is said to have spent between Rs 30 to Rs 40 lakh and a Lok Sabha candidate as much as Rs 60 to Rs 90 lakh. But even if the cost is one-tenth of these staggering amount, the poor man's party or candidate has no chance whatever.

Nor can representatives capable of spending such large sums be ever expected to work for the poor. In the same way, the vice of impersonation, fed on secret funds, and the use of physical force, supported by powerful political and caste interests, have been growing at an alarming rate. Corruption of the electoral machinery, commonly manifested in intimidation and buying up of presiding officers, has been growing apace alongside corruption in other fields.

That day it was an allegation for the state. But this day, November 12, 1992 to be precise, is an open recognition, when the prime minister inaugurating a conference of chief ministers on the 'Administration of Criminal Justice' lamented on the "very obnoxious criminalisation of public life" and there was "increasing criminalisation of politics and politicisation of criminals". He also observed that it has been talked about for a long time.

The liquor trade which was considered a social stigma up until the late 60s and associated mostly with bootleggers, the criminal and anti-social elements, started acquiring political respectability with the growing dependence of the political elite on the money and muscle power of the liquor traders. The auction system in arrack and toddy, the rivalry in illicit distilling of arrack and smuggling of IML to avoid excise, gave rise to the maintenance of criminal gangs by the liquor contractors. The liquor contractors who were kept at an arm's length by the politicians earlier, started becoming their close allies to begin with, but soon the temptations and compulsions of the changing nature of the elections and the growing resource needs of electoral politics turned many politicians into liquor contractors as much as some of the liquor contractors graduating into politicians. Thus by the end of 70s the criminalisation of political process gets rooted in the liquor and the very mention of regulation or control, leave alone prohibition, was met with ridicule and

dispensed as non-pragmatic by all major political parties, in or out of power. The plight of the people who are the victims of the spreading tentacles of liquor and the liquor-based politics hardly got any attention. It is in this context the anti-liquor movement of the women of Andhra Pradesh becomes all the more important. It is a major movement that can make the state to renege from the complete deviation from its own accepted policy.

This section deals with three aspects of the women's movement against arrack in Andhra Pradesh. First, it examines the factors contributing to the deterioration of the very subsistence conditions and other facilitating factors that could be discerned as immediate circumstances causing the movement. Second, it provides a brief and sketchy description of the movement. And at the end cautions against the possible simplistic interpretation of the movement in terms of drunkenness as the cause and 'disciplining' the male members of the household as the solution.

III

The Movement

THE BACKGROUND

By 1990-91, Andhra Pradesh occupied first rank in the country in arrack consumption with 111 million litres (30 UP) per annum. The other first rank occupied by AP is in terms of the total number of

seen in cinema theatres. In recent years consumption of all kinds of liquor increased steeply. Table 1 shows that the arrack consumption in the state increased from about 54 million litres (30 UP) in 1975-76 to 70 million litres in 1980-81 to 111 million litres in 1990-91. The consumption of IML increased almost five-fold in 80s, from 4.4 million proof litres in 1980-81 to 219 million proof litres in 1989-90. Table 2 shows that though the share of sales tax in the total tax revenue increased from 44 per cent in 1980-81 to 52 per cent in 1989-90 and share of excise duty in the total state tax revenue remained around 28 per cent, the excise duty in absolute terms increased almost five times in 70s from Rs 35 crore in 1971-72 to Rs 153 crore in 1980-81 and by almost six times in 80s to reach Rs 839 crore by 1991-92 (budget estimate). It is worth noting from Table 3 that 70 to 80 per cent of the growing excise was accounted for by the revenue from arrack, the poor people's drink. Thus, the substantial burden of the regressive excise duty was borne by the poor. The number of arrack shops increased from 7,159 in 1969-70 to reach the peak of 22,803 shops in 1987-88 but declined to 16,436 in 1990-91. The decline in the number of shops in no way shows any decline in the arrack demand but reveals the ingenious innovation in 1986 of arrack being packed in 90 ml and 45 ml polythene sachets, *Varuni Vahini*, a mythological name chosen by none other than the Telugu Desam leader NTR. The introduction of sachets made mockery of the very concept of a 'shop' and the rental in relation to shops. Arrack in sachets started flowing to the door step by peddlers on foot and by bicycle. This innovation afforded the convenience of arrack being carried to any place and broke the association of arrack drinking with arrack shop. From the complaints of women of rural Andhra Pradesh, one could guess the damage it caused through increased drinking with little regard to place and the time of the day or night.

Liquor is one of those commodities that flout all laws of economics. The increasing arrack consumption is accompanied by increasing price of arrack. The present price at which the state issues arrack to the contractor is Rs 10.50 per litre. The 'issue price' includes the cost, excise duty, transport charges, and bottling charges. The price at which the contractor sells to the consumer in sachets of 90 ml and 45 ml or bottles of 180 ml presently works out to Rs 50 to 60 per litre of 30° UP, i.e., the difference between the sale price and the 'issue price' works out to Rs 40 to Rs 50 per litre out of which the contractors have to meet the rentals which amount to about two-thirds of the total excise revenue. Of course, if one goes by the official data on arrack sales, it looks

as though the contractors do not seem to be big gainers!

For instance let us have a look at the AP official arrack consumption figures in 1990-91:

1 Total arrack consumption	11.12 crore 30° UP litres
2 Sale price at Rs 55 per litre	Rs 611.60 crore
3 'Issue price' at Rs 10.50 per litre	Rs 116.76 crore
4 Gross margin (2-3)	Rs 494.84 crore
5 Less rentals for shops	Rs 454.00 crore
6 Gross profits	Rs 40.84 crore

These figures show a gross profit of Rs 40.84 crore to arrack contractors in 1990-91. If one takes into consideration the maintenance expenses including the 'goonda gangs' the bribes paid regularly to the excise department, the contributions to political parties and other miscellaneous contributions paid out of fear or favour, the contractors appear to be big losers! Everybody knows that the official statistics on arrack is a mockery of truth. Obviously, the consumption of arrack is much higher and this is accounted for by the extensive illicit distilling and packing parallel to the government arrack. And the resulting drain on poor

TABLE 3: EXCISE REVENUE FROM DIFFERENT LIQUORS AND RICE SUBSIDY, ANDHRA PRADESH (Rs crore)

people's income on arrack consumption in AP in 1990-91 could be at least double that of Rs 611 crore of excise duty, i.e., Rs 1,200 crore. This, one could believe, is on the low side.

Much of it is hard-earned wage incomes of the entire households of the poor. Most of the drinking in rural areas is arrack and toddy. The proportion of arrack is much more. Most of the arrack drinking is by the poor families most of whom are agricultural labourers. Though women do drink in Telangana region but largely the few women who drink are confined to toddy. Castewise drinking is a social taboo among the forward castes and some groups of the backward classes. Drinking of arrack or toddy by schedule castes does not carry any social stigma. In fact, the women who are protesting against arrack are not faceless poor but mostly scheduled caste women who are the direct sufferers. This caste demarcation is clear in the village struggle committees though there may be some sprinkling of forward caste and women as leaders. One could easily see where the entire burden of excise duty on arrack resides.

In the 80s, the employment situation in AP has been worsening. There has been no substantial increase in wages. The prices of essential commodities like pulses, edible oil, tamarind and chillies have increased by 30 to 50 per cent during the last two years. The subsidised rice scheme, though not properly targeted, did help the poor. One may criticise it as a 'left-handed' charity because the state was taking away with other hand in the form of excise duty on arrack much more from the poor than what is given with the one hand by way of rice subsidy (Table I). The 'Rs 2 per kg rice programme' in AP was tampered by the Congress(I) government two years ago and the price of rice for green card holders was increased from Rs 2 to 3.50 per kg and the quantity reduced from 20 kg to 16 kg per family per month. These conditions are objective enough to make one perceive arrack as the major cause of ruin of the family life and living conditions of the poor and even the lower middle class.

However, arrack trade and consumption have definite extra-economic dimensions out of which at least two are most important; one is social, i.e., the gender specificity of the suffering and the other is political, i.e., criminal portends with its ramifications for the political and the civil life of the country. Invariably, it is the man who blows much of the household income on arrack and women of the household who has not only to struggle to provide for the subsistence of the children and the household and also end up at the receiving end of all the abuse and beating that often goes with the drunken male. The other, i.e., the political part is the power wielded by the liquor contractors, their criminal

activities and political nexus leading not only to loss of respect for political processes but also loss of hope of transformation for the better. It is in this context the demand for arrack ban by the CPI(ML) groups during the last few years in north Telangana districts and the women's movement starting-off in Nellore district acquired a spontaneity and spread all over the state.

THE EVENTS

While the post-literacy period in Tamil Nadu and Pondicherry seems to have ironically helped the BJP's newspaper to increase its circulation among the neo-literates, the 'Akshara Jyoti' programme assisted by the state and CPI(M), has a different historical trajectory in Andhra Pradesh, thanks to the radical politicisation of issues related to the women's struggles for survival. In Nellore, Chittoor and elsewhere, the neo-literate women in the villages pledged to fight against the "arrack-demon" in the concluding sessions of the Akshara Jyoti programme. Since then, a new momentum has been unleashed by the women over the last three months. To their credit it can be said that they have converted a women's movement to a people's movement which among other issues of class and state power is equally concerned with women's question.

There is echo of support for the CPI(ML) ban on liquor among the Nellore

women who seem to have been inspired by it. Akshara Jyoti programme has also engendered an urge to survive with dignity—the dignity of labour—as also protect the household income against the 'arrack demon' so that their families can survive and they can educate their children. The neo-literate rural women's determination for survival, for dignity of labour and for education of their children has acquired new proportions. A dalit woman of Nellore said, "we will not allow arrack sales in our village even if they shoot all of us women. Better die once than die every day."

The anti-liquor mass movement has not merely raised a women question as being portrayed by the press and a section of the intelligentsia but also targeted its attack on the nexus between the so-called 'people's representatives', police and arrack contractors. When the women are demanding prohibition on arrack for a dignified survival, the people's representatives in the state government are busy in talking about the impending revenue loss in view of the prohibition. When the activists reply that the revenue problem is minimal because revenue can be generated through sales tax, commercial tax, etc and that, in any case, during the post-prohibition period general consumption of commodities is likely to increase in urban and rural areas as well, the Congress government retains its usual degree of quietism. In this sort of arguments, counter-arguments and

Agricultural Economics Research Centre

UNIVERSITY OF DELHI

Applications are invited for the post of one Senior Fellow, who may also be required to perform the duties of Director of the Centre, in the pay scale of Rs. 4500-150-5700-200-7300 plus usual admissible allowances. Applications must reach the Chairman, Governing Body, Agricultural Economics Research Centre, University of Delhi, Delhi-110007, not later than June 5, 1993 by registered post.

Note (1): Persons who have applied in response to the earlier advertisement dated 20th November, 1991 need not apply again.

(2): Details regarding prescribed qualifications can be had from the Centre by post or in person during working hours.

Prof. A. L. Nagar, Chairman.

more often the silence of the Congress government, the ongoing people's movement has unfolded its concerns to reform the family structures as well as exposed the class character of the excise policy of the ruling parties, both the Congress and Telugu Desam.

The village committees formed in different villages are invariably led by the women of the poorer dalit households. These committees do not have any representation from the Congress or Telugu Desam. This is true of the most of the village committees, be in the coastal districts or Tdangana. In some villages as in Nellore, the upper caste women have only passive support for these committees. In other villages like the ones in Ranga Reddy district no upper caste women are even remotely concerned with the struggle against arrack contractors and police who are protected by the ruling Congress and the opposition Telugu Desam. These committees however receive political aid and moral support from the state-level mass fronts like Jana Vigyan Vedita (aided by the CPI(M)), the Progressive Organisation of Women (aided by a CPI(ML) group), and Andhra Pradesh Dalit Mahasabha. In Nellore district alone where the present mass movement has initially begun, the movement is organised by the Anti-Arrack Co-ordination Committee comprising 36 voluntary organisations. In Chittoor district there are 250 voluntary organisations, active in the village committees comprising mostly women and youth spread in more than 200 villages of the district.

Aided by these voluntary organisations, the village committees led by the women have pressurised their men to usually take oath in the village temples to stop drinking arrack. In case of violation of the pledge, the men would be forced to pay a heavy fine to the temple and the families would be banished from the villages. In some cases the wives have physically prevented their men from visiting arrack shops but are wondering how far could this tactic sustain when they (women) have to go for transplantation very soon.

In the villages after villages, the women squads have discovered three instant instruments of struggle—broom, chilli powder and fire. They counter the threat from police and the drunken males with broomsticks and chilli powder—reminiscent of Fakir Mohan Senapati's powerful short story 'Patent Medicine' and Ketan Mehta's film 'Mirch Masala'. They attack the contractors' dens and set fire to the barrels and sachets. These attempts symbolically aim at purification of their villages by burning the 'arrack demon'. The messages against the ill-effects of arrack on the household economy and against the nexus of police and arrack contractors are spread through graffiti,

street plays, rallies, door-to-door campaigns and public meetings in the villages. There is a beautiful graffiti which portrays how women are marching forward, breaking arrack bottles and how the contractor and two police men are shell-shocked by this crusading spirit of the women. The women squads also prevent auction sales being organised by the excise department—a strategy initially adopted by the CPI(ML) 'dalams'. In Nellore alone, they have stalled auction sales 36 times. This is true of almost all district auction counters. As a result, many women have been arrested and police have filed false cases against them. More and more such repression is launched, the nexus between bureaucracy, police and arrack contractors is revealed before the agitating women. No wonder, the district collectors engaged in such auction sales are sarcastically labelled as 'Indian arrack sellers' (IAS).

There are villages where women are guarding against sales of the arrack by *en masse* squatting in front of the liquor shops. They have been preventing peddling of sachets by bicycle or foot, often receiving not only rebuke but also beatings. Most of these women are agricultural labourers and many of them are from families where they are the main breadwinners. Their work is seasonal and they are missing the season by keeping watch at the arrack shops. Their wages are too low to expect any possibility of falling back. Their menfolk are used to drinking with the wages earned by the women. So much so in a village in Ranga Reddy district when asked about female wages, a person answered, that it was "one sachet of arrack and Rs 1.50". Indeed that is what he gets when he takes the grain received as wages to the liquor shop! And there are villages in Mahaboobnagar where part of the wages are paid in toddy!

AN INTERPRETATION

As the movement against arrack unfolds itself, there are two important dimensions which become apparent. One is the determined bid by the state, particularly the police, the contractors' henchmen and the political parties, to dissipate the movement, and the other is the courage, valour and determination with which women are organising themselves against severe odds at the village level. The police often resort to attack on the agitating women, prevent their meetings by denying permission wherever possible, and provide protection to sell arrack, sometimes resulting in selling of arrack within the police stations. The contractors' goondas have been indulging in abuse and attack on women in villages where they are vulnerable, and attempting to bribe certain sections to clandestinely or openly sell arrack in the

vicinity of poorer households. The government or the ruling party has been trying to buy time in the name of gathering public opinion, hoping the delay would dissipate the movement. The only positive effect of the opposition party gimmicks appear to be putting fear of loss of votes and the consequent restraint on violent repression by the government. But the skin-deep commitment of the opposition parties is very well revealed by the total absence of any of their representatives at the village level committees formed by the agitating women.

The women's struggle, on the other hand, took a number of forms of picketing the arrack shops, in some cases confiscation and destruction of the arrack sachets, forming of 'battalions' of women who would keep watch in turns at the arrack shops, keep watch on the male members who are vulnerable to drink and on the arrack 'poachers' who would clandestinely enter the villages with sachets hidden in bags or baskets. There are instances of beating up, torturing and parading of male members who violate the village ban on arrack drinking. Closer at the household level there have been 'broom treatments' behind the closed doors and refusal to serve food for those coming home drunk.

These actions of the organised agitating women are necessary part of the movement and the celebration of their years of suffering and suppression. But any attempt to romanticise these actions may fall short of the objective of the educational process which it is supposed to serve. The suffering of the women, the very state of wife and husband speaking hate, the absence of love and affection within the household, the neglect of children and daily drunken brawls and the destruction of the very family life are adequate social indicators of the degenerating quality of life. It is the reflection of the shambles into which a nascent civil society is reduced and it is very much necessary to see its dialectical relations with the 'political society'. It is not enough if the women realise and agitate against the immediate cause—the arrack—that is responsible for their miseries. It is much more important for them to see that their misery including arrack is perpetrated by the social system which needs to be transformed simultaneously but without deviating from the immediate objective of ban on arrack.

IV

Policy Perspective

The arena of policy relating to liquor is most treacherous. If the history of the anti-liquor movements all the world over is any guide, it would offer one important lesson i.e., *there is no one-time universal*

policy. The policy if it were to be responsive to the interests of the people and safeguard people from any adverse manifestations, which there would be, should be based on time-space specificities. One guiding principle is that it should be responsive to people's aspirations and needs. For instance, whether it was the US or Scandinavian countries or China, there has been prohibition or scrapping of prohibition and again reintroduction, but all the while with one objective of reducing, if not eliminating the drink evil and the institutions which go with it. Given the awareness of these aspects, what follows in this section should be seen as a response to the immediate context rather than a once for all prescription.

When it comes to outlining the course of action on the part of the state, with the hindsight of the ingenuousness with which even the constitutional directives have been flouted, there has been a lot of hesitation and even fear. The fear is that in the name of a policy of prohibition there could be unabated bootlegging under the aegis of the very agencies which are supposed to enforce it. These fears become all the more real given the present role played by the liquor and liquor money in the elections. But, with the people's movement and their proper involvement, one hopes for a better enforcement. Keeping this in view, the following suggestions are made.

Prohibition, if it should be successful: (i) should be introduced in phases, (ii) should be backed by public opinion and widespread education including the school, the public media and informal channels, (iii) should involve social workers, public-minded persons, particularly women and voluntary organisations of proven record of good grassroots educational activities, and (iv) should have monitoring committees, particularly at the grassroots level with large women's presence to function as vigilantes or watchdog organisations with statutory power for enforcement.

The Tek Chand study team on prohibition (1963) and the Third Five-Year Plan make detailed suggestions regarding phased introduction of prohibition. Prohibition may be introduced in two phases. In the first phase ban arrack, treat arrack in tribal areas differently, reduce the number of IML outlets to the minimum, let toddy be regulated and ban 'matka', 'single number' and other forms of gambling simultaneously. Let us elaborate each of these measures.

Arrack

(a) The sale of arrack should be banned throughout the state and involve large vigilance committees, at all levels, particularly at the village level with at least half the representatives from among women, in the enforcement of the ban. The en-

forcement should not be left to the police or excise department. (b) As the Third Five-Year Plan suggested in pursuing the programme for prohibition, the customs and traditions of tribal people must be fully respected. The recommendation of the Tek Chand committee needs to be given due consideration: "The adivasis or scheduled tribes with whom drinking is traditional may be allowed to brew such beverages to which they are accustomed for their consumption only". "...a change has to be brought about in their mental approach and social outlook through the more enlightened members of their community, than through persuasive law".

Indian-Made Foreign Liquor (IMFL)

(a) The number of IMFL shops/outlets should be restricted to at least one-fifth of the present number. The shops should not be given to private trade but should be state-owned outlets operating for limited number of days in a week and limited number of hours in a day. (b) In a state like Andhra Pradesh with an annual consumption of three million litres of arrack, one cannot wish away that all arrack drinkers would stop suddenly in response to a ban. Introduce low duty cheaper IMFL which should be sold in limited quantity per person. This is based on Tamil Nadu experience, which may be improved by restricting the sale to only full bottles which would serve as a damper on poorer buyers. This is to wean gradually the hard addicts of arrack in the transition period and to check such persons taking to illicit arrack, which should be stamped out with people's co-operation. (c) The selling and serving of IMFL of more than 5 per cent alcohol content in all public places like hotels, restaurants, bars, etc, and public functions should be banned—a lesson should be learned from Tamil Nadu where prohibition is made a mockery by allowing large number of bars recently. There should be restrictions on location of IMFL shops in the vicinity of public institutions like educational institutions, religious places, state/national highways, etc.

Toddy

Toddy need not be bracketed with arrack and IMFL. In view of the low alcoholic nature of the drink and its entraining the livelihood of millions of toddy tappers, toddy should be treated separately. It may be necessary to take a leaf from the Tek Chand study team's report here; "toddy may be allowed to be served subject to the following safeguards: (i) A ceiling of 5 per cent alcohol in bulk should be fixed; (ii) The production and the sale of toddy should be under government control; (iii) Wherever possible, bottling to guarantee standard, and refrigeration to stabilise alcoholic strength should be provided; (iv) The drink may be con-

sumed only at the place of sale and not be allowed to be taken home; (v) The quantity of toddy that can be served to an individual should be suitably limited and the vendor or barmen should be under statutory obligation not to violate this condition; (vi) The price of toddy and the tax element, if unavoidable should be kept as low as possible with a view to dissuade people from drinking the hard product of illicit distillation; (vii) Drinking should be allowed only within regulated hours; (viii) The production and sale of toddy within a radius of five to ten miles of palm gur centres should be stopped; and (ix) There should be an age limit of 21 years below which no consumer may be served the drink.

Illicit Arrack, Drugs, 'Matka', 'Single Number', Etc

Banning of arrack does not automatically guarantee that poor people would switch their expenditure towards other domestic items like food, clothing, children's education, sanitation, etc, that would improve the standard of living of the entire household. Several studies have revealed that a mere ban on arrack would not bring about the desired results if it is not accompanied by a similar ban and strict enforcement of laws relating to illicit liquor, matka, single number game, drugs, etc, towards which the poorer households are highly vulnerable.

The second phase should be one of continued campaign with all the sources of mass media against the adverse effects of not only alcohol but all kinds of drugs and narcotics. This phase should be based on the experience gained during the first phase, with adequate flexibility towards elimination of the possible distortions and deviations. Strengthening of education, public opinion and grassroots institutions against consumption of liquor should play a major role. It is essential to keep adequate room for debate and constant review. The room for discussion, critical and continuous evaluation and modification. Only thus the country can gear up to face much graver problem that is looming large at the horizon, viz, the 'drugs'.

[We are grateful to Progressive Organisation of Women (POW), the Co-ordination Committee for the Women's Struggle Against Arrack, R Radhakrishna, R S Rao, M S S Pandian, G Haragopal, Vimala and K Ilaiyah for their help, encouragement or comments.]

Changes in Land Distribution in an Agrarian Economy

Measurement of Household Mobility

Madhura Swaminathan

IN the research on patterns of transformation of agrarian society in developing countries, an important question relates to the nature of household economic mobility, in particular, the economic mobility of households in terms of the extent of ownership of land, and its implications for inequality in the distribution of land. Papers on this theme that are based on empirical evidence from south Asia include Attwood (1979), Cain (1981) and Harriss (1985), and, most recently, a paper by Sakti Padhi and K N Nair in this journal (*EPW*, March 20-27). This note discusses a methodological problem that is common to these papers.

Mead Cain's (1981) study is based on data from three villages in the semi-arid regions of south and central India (two in Maharashtra and one in Andhra Pradesh) and one village in Bangladesh. I shall comment here only on the evidence relating to India and on the sections that deal with changes in land distribution and household mobility. (The main theme of the paper is the relation between fertility and environmental and social risks.) Data were collected in 1980 from 119 households in the three villages; these households were stratified for purposes of sampling into four groups on the basis of operational holdings of land. Information was collected, first, on the land owned by a household at the time of survey, that is, in 1980; secondly, on the extent of land owned by a household 'at inheritance'; and, thirdly, on land transactions in the interim. In the case of landless households, the initial point in time ('at inheritance') refers to the time at which the household came into independent existence. Changes in the distribution of land and household economic mobility in terms of ownership of land were then measured between the time of inheritance and date of survey.

As the period 'at inheritance' does not refer to the same point in time for all the households but rather to different points of time for different households, it is not meaningful to create a distribution of landholdings 'at inheritance'. Cain constructs Lorenz curves for the distribution of land owned by households 'at inheritance' (an aggregation of the landholdings

of households at many different points in time) and for the distribution of landholdings in 1980 and uses them to monitor changes in inequality in landholdings over time. He then goes on to construct a mobility matrix for the period 'at inheritance' to 1980. Since the initial reference period is not the same for all households, it makes little sense to aggregate them (as is necessary for the construction of a matrix) and compares economic mobility across households over time. (Note that the creation of a matrix implies that the economic mobility of a household is being considered in relation to the economic mobility of other households and not just its own past position.)

Let me give an example. Suppose I surveyed households in a village in March 1993 and asked each household for information on the extent of land it currently owned as well as on the land held by the household at the time it inherited land (or at the time it became a separate household). Assume that, from the households surveyed, the range of dates representing the point 'at inheritance' stretched from January 1950 to January 1990. If I then followed the Mead Cain methodology, I would add up the landholdings 'at inheritance' of each household, present them as a single statistical distribution of landholdings 'at inheritance' (despite the fact that 'at inheritance' represents dates separated by 40 years) and compare this distribution with the actual distribution of landholdings in March 1993. Note that if the year of inheritance is common to all households, then a distribution of landholdings 'at inheritance' would be appropriate.

For a study on the impact of new agricultural technologies on village economies John Harriss collected data on landholdings and land transactions from five villages in Tamil Nadu [Harriss 1985]. This note only deals with sections of his paper that discuss mobility in landholdings over time. Harriss' concept of mobility is similar to that used by Cain: it is based on changes experienced by households from the time of inheritance to the time of survey in 1984. To measure mobility, Harriss also presents matrices of change in landownership between the

'time of inheritance' and 1984. It is not clear at all how these matrices are to be interpreted, since they are based on an aggregation of households that inherited land at different times. (Note that the criticism here is not of Cain's or Harriss's concept of mobility but of the method adopted for measuring mobility.)

Sakti Padhi and K N Nair in their paper 'Dynamics of Land Distribution' attempt to present, in their words, an 'alternative approach' to the study of changes in land distribution. Their method is similar to Cain (1981). They write, "the major purpose and point of departure of the present study is thus to provide a general methodological critique of the conventional approach to the study of changes in land distribution and the inferences drawn, assertions made and speculations attempted" (p A-29). Padhi and Nair use data from a Land Utilisation Survey that covered 27 villages in Kerala, conducted in 1987. Information on the year in which a household came into independent existence (in terms of operating land) and the land transactions between that year and the time of survey is used to reconstruct landholdings for what they term the 'point of origin'. Padhi and Nair recognise that the 'point of origin' is in fact not a unique time period because "different households in the sample... originated at different points in time" (p A-31). Despite this recognition, they construct a decilewise distribution of landholdings at the "point of origin/1970" and use it to investigate changes in inequality. (For households which came into existence prior to 1970, the year 1970 was taken as the 'point of origin' since data on land transactions were not available for earlier years.) "In order to get at the distributional change for the same households over time, we have estimated the change in decile shares between point of origin/1970 and 1987 for an unchanging household distribution" (p A-33, italics in original). (I read this, of course, to mean an unchanging set of households.) Next, to examine the nature of household economic mobility with respect to the ownership of land, they construct a "two-way percentage distribution of sample households, by size-class of operated area at point of origin/1970 and size class of operated area in 1987" (ibid). As I have tried to make clear, constructing a mobility table in which the rows are based on an aggregation of land held by households in different years (Table 5, p A-33) is not meaningful.

D W Attwood's (1979) study of change in a village in Maharashtra is even more

problematic since it attempts to compare the current distribution of landholdings in a village with a distribution of landholdings of the 'same' households two generations ago. Households were interviewed in 1970 on their current landholdings and male respondents asked to recall the extent of land held by their fathers and grandfathers. From this, the land held by a household in '1920' was reconstructed. The term '1920' is used by Attwood to refer to the "decade before the depression of the 1930s". As in the other examples, the distribution of land in '1920' is based on an aggregation of landholdings in different years.

There are other serious problems with Attwood's study. One of these is the selection of a multi-generational family as the unit of study. (Some of the problems associated with a multi-generational household are, in fact, discussed by Padhi and Nair.) Attwood restricts the definition of a family to a single line of descent, tracing it back from the household interviewed in 1970. He does not take account of land partitioned among collaterals in any of the generations. The comparison of land held by a 'household' in '1920' and in 1970 is based on changes reported by a single branch of the family. If it were the case that two brothers, who formed separate households, were interviewed in the course of the survey, there would have been a double counting of the common land owned by their ancestors. In addition, data based on inter-generational recall are likely to be subject to substantial error. Memory lapses were noted to be particularly serious among respondents from currently landless households who recalled that their ancestors owned land 50 years ago. Attwood simply assumed that their fathers or grandfathers belonged to the category of 'small and medium' landowners.

Information on intra-generational changes in landownership is, without doubt, of much interest and value to students of economic mobility and rural change (as indeed, Cain's and Harriss's work also shows). Such data can be used to ask, for example, the following questions: How many households lost the land that they inherited? How many households that inherited some land became landless? How many household acquired land since they came into independent existence? Did any households that were landless at the time of their information acquire land later? Are the proportion of land-losers greater than the proportion of land-gainers? What proportion of households owned the same amount of land that they inherited? To take some examples from Cain's paper, Cain found that the majority of households in his survey (55 per cent) experienced a change

in the extent of land owned between the time of inheritance and 1980. He also found that 37 per cent of households in his survey acquired land and added to their inheritance.

An interesting example of how data on intra-generational changes in landownership can be examined is in Bhaduri, Rahman and Arn (1986). Using data from four Bangladesh villages, they investigated the economic mobility of households in terms of intra-generational changes in the extent of land that the households owned by creating an index of the ratio of current landownership to inherited landownership for each surveyed household. They then classified households by the degree of relative stability in landholdings.

There are three widely used methods of collecting data for studies of economic mobility that describe or characterise a given group of individuals or households at successive points in time [Atkinson 1980]. First, a longitudinal study can be undertaken in which households are surveyed in one year and resurveyed after a period, say, 25 years. (Atkinson refers to this type of data as data collected on a prospective basis.) Secondly, data collected in a previous survey can be used to identify a household or person for resurvey. Thirdly, retrospective data can be collected from a household about an earlier year, for example, the occupation of (or land owned by) a respondent at age 20 or 'ten years ago'. (Data on land inherited by a household are also retrospec-

tive data but they may not refer to the same year for all households surveyed.) The purpose of this note is to show that more care is needed in the selection of methods of analysis and interpretation of data that are based on recall and do not refer to a unique time period. It is not meaningful to use methods of analysis applicable to panel data (for given households in specific years) to data that relate to different years for different households.

DOCUMENTARY FILMS

Videocassettes of the following documentary films by Anand Patwardhan are now available for Rs 400/- each (inclusive of postage). Discount rates for bulk order are available on enquiry. Please send cheques or demand drafts in the name of Anand Patwardhan, C/o Centre for Education and Documentation, 3, Suleiman Chambers, 4, Battery Street (Behind Regal Cinema), Bombay - 400 039. Tel. 202 00 19

The films are:

- 1) *Bombay Our City* (1985): On the daily battle for survival of the slum dwellers of Bombay. (Awards: Special Jury Prize, Cinema du Reel, France, 1986; Best Documentary, India, 1986; Filmfare Award, Bombay, India, 1986)
- 2) *In Memory of Friends* (1990): On the legacy of Bhagat Singh and his relevance in the Punjab of today. (Awards: Jury Prize Mannheim, Germany, 1990; Silver Conch, Bombay, India, 1990; Best Investigative Documentary, India, 1990).
- 3) *In the Name of God (Ram Ke Naam)* (1992): On the growth of Hindu fundamentalism as exemplified in the Ayodhya Conflict. (Awards: Filmfare, Best Documentary 1992, Ecumencial Jury Prize, Nyon 1992; Critics Prize, Fribourg 1992, National Awards Best Investigative Documentary 1993). * Available in Hindi or English subtitled versions (Please specify).

**WHILE YOU
FOCUS ON YOUR
BUSINESS GROWTH**

**LEAVE THE
FINANCIAL HASSLES
TO SM FINANCE**

People with ideas, ambition and drive. Always on the go. Able to think on their feet. The ones who create

opportunities and provide jobs while boosting productivity.

All they lack is the time for the tedious but necessary

management of their finances. The hassles they would love to handover to somebody competent and help them concentrate

where they specialise.

That's where SM Finance comes in. The one answer to all your financial hassles. From

public issue management, capital structuring, corporate counselling and mergers & acquisitions to loan syndication,

leasing, hire purchase and bills discounting. Also, organising of foreign currency loans and equity participation by

multinational agencies. The issue house division acts as the registrar and transfer agents.

We cover a full range

of financial services you're ever likely to need. And we understand that you need to focus on your business, not financial

hassles.

To get a further understanding on how you can make SM Finance

as your financial arm, just write to, or better still ask for S R Sridharan

End of Alternatives?

The fundamental aspect of the transition that human society has been going through in the last few years is the end of alternatives—not just the erosion of alternative centres of power and systems of development and governance (the collapse of the socialist and the third world poles) but, though partly related to that, erosion of ideological perspectives, frameworks of knowledge and modes of consciousness. **1100**

Industry in the Eighties

The decade of the eighties was a most interesting period in the history of Indian manufacturing industry. During this period industry broke loose of the state of stagnancy that had persisted for much of the previous two decades. This growth episode was, however, terminated abruptly at the end of the decade when the government was forced to resort to a programme of demand contraction and import compression to tackle a balance of payments crisis of unprecedented magnitude. An exploration of the inter-linkages between industrial growth in the eighties and elements that impinged on it such as demand, productivity, costs and prices, investment, employment, structural change and the balance of commodity trade. **M-54**

VAT in a Federal Economy

For all its merits, introduction of value added tax in a country with a federal structure is fraught with difficulties. A model for moving towards VAT in a large federal economy such as India. **1108**

Panchayats and Power

Despite the apparent success of panchayati raj in West Bengal, the overall domination of the privileged classes over the rural power structure remains unchallenged. **1080**

Privatisation

Does the government have a 'privatisation policy'? If so, what is it? **M-71**

Subaltern History

The practice of subaltern history must aim to take history to its limits in order to make its unworking visible. **1094**

Make vs Buy

In what ways do the new microelectronics-based or computerised production technologies affect the 'make/buy' or production subcontracting policies of firms? **M-63**

Many Kalahandis

While Kalahandi has become synonymous with drought, starvation and poverty, many other drought-prone areas in Orissa and the adjoining states suffer from the same pattern of mass distress which is rooted in distorted development perspectives. **1084**

Unpatentable

The attempt by the National Institute of Health in the US to patent partial cDNA sequences corresponding to gene fragments in human brain tissue has raised the issue of patentability of human interventions in naturally occurring substances. **1089**

Rural Markets

Rural areas exhibit sharper and varied regional preferences with distinct predilections, habit patterns and behavioural characteristics. These regional and local variations have to be assimilated in the marketing mix of new products. **M-77**

'Burden' of PSEs

Has the deficit of public sector enterprises been rising and has the financial burden of the PSEs on the government budget been increasing? **1121**

LETTERS TO EDITOR

Tax-Sharing

IN my article 'Towards an Alternative System of Tax Sharing in India' (*EPW*, March 20-27) it was suggested that the states' share in central taxes should be fixed as a percentage of the total gross tax revenue of the centre composed of income tax inclusive of penalties and interest, corporation tax, customs and union excise duties, additional excise duties in lieu of sales tax and taxes levied under Articles 268 and 269 of the Constitution and that this percentage should be 33.33 per cent of the centre's total gross tax revenue computed on this basis as against the present share of states in the divisible pool of taxes, which works out to around 25 per cent of the gross tax revenue composed of income tax, corporation tax, customs duty and union excise duties and additional excise duties in lieu of sales tax. The working for arriving at the above percentage is indicated below:

	Base Year 1990-91 (Rs Crore)
I Centre's tax revenue	
(1) Union excise duties (sharable) inclusive of earmarked cesses on various commodities (not sharable)	24,514
(2) Customs duties	20,644
(3) Corporation tax	5,335
(4) Income tax	5,371
(5) Wealth tax	231
(6) Expenditure tax	82
(7) Other taxes and duties	1,399
Total	57,576
II Article 268	
(a) Stamp duties	2,087
(b) Duties on medicinal, alcoholic and toilet preparations	40
III Article 269	
Central sales tax	3,105
IV Interest and penalties in the case of income tax (estimate)	200
V Yield from pre-emptive purchase of properties in metropolitan cities (estimate)	100
Total	63,108

Currently the share in central taxes accruing to the states is as follows:

	1990-91 (Rs Crore)
(1) Devolution (or 25.24 per cent of Rs 57,576 crore)	14,535
(2) Central sales tax	3,105
(3) Stamp duty	2,087
(4) Tax on alcoholic, medicinal preparation	40
Total (or 31.32 per cent of Rs 63,108 crore)	19,767

It may thus be seen that 33.33 per cent of centre's gross tax revenue recommended in the paper is higher than the share currently accruing to the states. Besides a share of one-third to the states and two-thirds to the centre will represent a good balance in sharing of tax revenue between the centre and the states. As already stated, taxes and duties listed under Articles 268 and 269 are either grossly under-exploited or not exploited at all while items like interest and penalties and yield from pre-emptive purchase of properties in the case of income tax are not even added to the divisible pool. As explained in the paper, the proposed model could possibly lead to much higher buoyancy of several taxes and duties which now remain 'sleeping beauties'.

S GURUMURTHI

Madras

Selective Amnesia

CHRISTOPHE JAFFRELOT's 'asceptic' approach to history 'Hindu Nationalism: Strategic Syncretism in Ideology Building' (*EPW*, March 20-27) brings into sharp focus the crisis that has overtaken the intellectuals who had been dominating the Indian scene for almost a century. Jaffrelot has marshalled literature to argue that Ram Mohun Roy and Swami Dayanand had attempted to 'invent a golden age' or 'invent a tradition' to counter the threat posed by Christian missionaries. This invention or discovery, according to him, was a myth which was used to pro-

vide respectability to Hinduism. He also discusses the formation of the Hindu Sabha and Hindu Mahasabha as movements to 'confront militant Islam', which led to 'political crystallisation of Hindu nationalism'.

It is not intended here to enter into detailed discussion on the content or the presentation of Jaffrelot's paper. Instead, attention is drawn to the glaring omission of a number of important facts concerning the argument. The Bible was closely associated with the British flag. Earlier, Christianity thrived when the Portuguese conquered Goa. A quarter of the population was converted to Islam following the Muslim conquest of India. Incidentally, why is it that the entire population was not converted, as happened in the case of Iran? Why did not the Hindus 'invent tradition' when they came in contact with Christianity, Islam and Judaism in the early centuries of the Christian era? Finally, coming back to the role of the Hindu Mahasabha, the author omits the fact that it got virtually no seat and only a tiny fraction of votes in the elections held prior to independence, when the Hindus voted overwhelmingly for the Indian National Congress, while the choice of the Muslims was mostly the Muslim League.

Could it be that such selective amnesia among the dominant intellectuals of India has led to the revival of 'Hindutva' and the 'Hindu Rashtra' movement which has plunged the country in the Ram Janmabhoomi-Babri Masjid crisis?

Dog Days

THE thunderstorm all of a sudden lashing Amethi has provided the alibi for postponing the scheduled session of the All-India Congress Committee. The real reason for the postponement must however be the tidings conveyed by the parliamentary and state assembly by-election results. The Jullundur swallow has been unable to make for a Congress(I) summer. From everywhere else in the country, the results are uniformly disappointing. In Gujarat, the Bharatiya Janata Party has without question relegated the prime minister's party to the second position. In the single by-election held in Karnataka too, while the BJP could not win, it has at least succeeded in breathing down the neck of the Congress(I). If credence is to be given to reports received from diverse sources, the Congress(I), fighting a lonely battle against both the DMK and the AIADMK in adversarial roles, had little chance of success in the Lok Sabha by-polls for the Palani constituency in Tamil Nadu; the prospects were hardly better in Ottapalam in Kerala. By postponing these two by-elections for altogether specious reasons, the Chief Election Commissioner has saved the Congress(I) from extreme discomfiture. No such escape hatch was however available in Andhra Pradesh; the party lost both the assembly by-elections in that state to the Telugu Desam Party by sizeable margins. No respite waited for it in Bihar either. Laloo Prasad Yadav has seen to it that not only the Janata Dal victor decimated the BJP in the by-election for the Patna Lok Sabha seat by a margin of more than one-and-a-half lakh; he satisfied himself additionally by seeing to it that the Congress(I) candidate came a very poor third.

These results—to which one should now add the message underlying the outcome of the panchayat elections in West Bengal—in the overall constitute a major disaster story for the Congress(I). The south seems to be caving in, and, in case the kind of coalition of Muslims, backward classes and scheduled castes Laloo Prasad Yadav has been able to cement in Bihar were to be repeated in Uttar Pradesh and elsewhere, the Congress(I) might cease to be even the second most important party in Aryavarta. By raising the demand that the party must apologise to the Muslim community for the demolition act at Ayodhya, Arjun Singh might be, up to a point, grinding his private axe; the sentiments are nonetheless widespread inside the party that tomorrow might not necessarily be another day unless a drastic reappraisal takes place in its general strategy and tactics, and that faith in the inertia of the system would no longer effect a rescue act. The thunderstorm at Amethi must have therefore come as a godsend to the prime minister and his close supporters.

The by-election results must have provided some extra food for thought to the BJP as well. Its assumption of the inevitability of capturing power at the centre if only the general

elections were hurried suddenly looks much less realistic than it did in the aftermath of the Ayodhya frenzy. True, it is close to making a breakthrough in Karnataka; in the rest of the south though it has a very long way to go before it could cease to belong to the also-ran category. Along with its ally, the Shiv Sena, it might succeed in getting a sizeable number of seats in Maharashtra should a general election be forthcoming; a clear-cut victory for it in that state still looks unlikely. One may, for the sake of argument, go along with the suggestion that, if present trends persist, it should do extremely well in Gujarat, Rajasthan and Madhya Pradesh. In contrast, in the case of that most crucial state with 85 seats in the Lok Sabha, Uttar Pradesh, the prognosis can scarcely be cheerful. For, were the Janata Dal to succeed in working out a measure of an electoral arrangement resembling the Bihar coalition of castes and communities, and Mulayam Singh Yadav persuaded to endorse the arrangement, the poll outcome in the country's most populous state is more likely than not to be a toss-up. In case Choudhury Charan Singh's son chose to move in with the Congress(I), the 85 Lok Sabha seats might in that event be split about evenly three-ways. That would leave the Bharatiya Janata Party a very considerable distance away from the realisation of the dream of enjoying a plurality in the Lok Sabha.

The May by-elections could thus herald a change in mood among the political parties. The BJP might not continue to be as strident in its demand for an immediate general election as it was during the past few months. At the other end, the Janata Dal-Left Front combine need not be as hyper-apprehensive about the outcome of a snap poll as it has been till now. Whether such a general election will actually eventuate will therefore largely depend upon the manner the inner tensions work themselves out within the Congress(I) party. One conceivable reaction to the setback in the by-elections would be to close ranks and try to postpone the evil day of a general election as long as possible. Those in the party, who have meanwhile convinced themselves that the longer the present leadership remains in charge, the greater is the certainty of hastening the party's doomsday, might be itching to force a showdown. If push comes to shove, they need not be greatly averse to effecting a vertical split in the party, which would make seeking a fresh mandate from the electorate inevitable. If, against this background, the Americans were to make up their mind to indulge in some not-so-gentle arm-twisting over Kashmir, things would become even more complicated. Whatever direction the political developments take, it is a fair guess that the much-vaunted economic reforms would, in such circumstances, have to ride on a roller-coaster. And that could contribute further to the Congress(I)'s woes.

Dancing to Speculators' Tune

THE Bombay Stock Exchange (BSE) authorities have permitted short sales without delivery being effected in all the 94 scrips of the so-called 'specified' group, though with a daily margin of 30 per cent and carryforward sales restricted to Rs 50 lakh in a single scrip and Rs 3 crore in all scrips together. This has been done ostensibly "in view of the steady trend in share prices in the last few days". The stock market is yet to recover from the upheaval caused by the bank-cum-stock market scam. Brokers are obviously anxious to boost market activity which has taken a beating in the wake of the scandal. The average daily turnover of the BSE which had touched Rs 317.01 crore in April 1992 dipped to Rs 71.74 crore in December 1992; since then it has improved to Rs 170.70 crore in April 1993. The government is also apparently playing the bears against the bulls, to ensure that share prices remain attractive to foreign financial institutions. The central budget for 1993-94 did not, quite rightly, provide any large and direct incentives for the corporate sector and the capital market, but the government could not resist the pressure when equity prices in the secondary market slumped continuously and had to come up with some additional incentives for saving: an increase in the exemption limit for income-tax purposes and a higher limit for saving in specified media, raised from Rs 7,000 to Rs 10,000, for tax rebate purposes. This helped to perk up sentiment in the share market and the BSE sensitive index (1978-79=100) moved up from 2,037 on April 26 to 2,358 on May 21. The permission granted for short sale has encouraged bears to pull down prices, with the BSE index steadily declining to lower levels thereafter. Rampant speculation, it is reported, has resurfaced in the stock exchanges as a result of a number of companies entering the market to bolster up their own share prices in an attempt to counter the manipulations of bear operators.

The BSE authorities' action raises the basic question whether organised speculation is at all necessary for the healthy development of the capital market. The question was posed and answered some years back by the G S Patel Committee on Stock Exchange Reforms. The committee had underscored that in the Bombay stock exchange only about 8 per cent of all share transactions represented purchases and sales of securities by investors; the rest were forward or speculative transactions. This was so despite the fact that forward trading had been officially banned as far back as in 1969. Subsequently the authorities themselves brought in forward trading by the back-door in the guise of the 14-day delivery

and carryforward system, under which transactions are allowed to be carried forward almost in perpetuity through renewal of contracts and payment of contango ('badla') charges or, in rare cases, backwardation charges ('undho' or 'ulta badla'). In April 1993, out of a total turnover of Rs 2,048.35 crore, Rs 1,597.10 crore or 78 per cent was in the 94 'specified' scrips, the bulk of it speculative. The Patel Committee accurately labelled such transactions as 'gambling in differences', with no intention to take delivery of the shares purchased and to give delivery of those sold. Such carryforward deals are restricted to the 94 'A' group scrips and so the argument that they help to create liquidity in individual scrips is without much basis. They do not serve the objective of continuous price formation in a majority of the scrips. Despite all the molly-coddling by the government, or rather because of it, the share markets serve primarily the interests of speculators from among share brokers and operators from the corporate world. Such a closed-door arrangement encourages a number of malpractices including, to quote the Patel Committee, "extensive insider trading, manipulation of markets, evasion of taxes, generation and proliferation of black money and, above all, frequent crises and growing instability of the markets". The government and the stock market community never tire of claiming that there has now emerged in the country a 25 million strong shareholding public with a strong investment consciousness. If that be so, there is that much less need for a class of speculators to provide liquidity and marketability for individual scrips. The time is therefore just right to effect reform of the stock exchanges on the lines recommended by the Patel Committee.

Against this background, the reported decision of the Securities and Exchange Board of India (SEBI) to consider replacing the present 14-day settlement by a system of options and futures calls for a second look. The objective, it would seem, is more to provide a so-called level playing-field for bulls and bears than to curb the speculative urges on both sides.

IMMUNISATION

Blinkered Approach

THE government of India's high profile universal immunisation programme was launched in 1985-86 with the objective of immunising 85 per cent of infants against diseases preventable with vaccines, that is, tuberculosis, measles, diphtheria, whooping cough, tetanus and polio. Programmes were prepared to reduce neonatal tetanus mortality to less than 1 per 1,000 and the polio incidence rate to 0.33 per 1,000 children in the age-group zero to four years. The programme also covered pregnant women with the objective of preventing maternal and neonatal deaths due to tetanus. At that time and subse-

quently the immunisation approach had been criticised as being narrowly technical which was likely to fail in the absence of a comprehensive approach to disease eradication.

The Comptroller and Auditor General's review of the programme now shows that while the programme has not entirely failed, there are major lapses which will make even the limited objective of eradicating immunisable diseases, leave alone the others, difficult to achieve. And these problems are precisely the kind which occur in the absence of a broad-based approach to preventive, promotive and curative health.

The report finds that only eight states have fully achieved the target under all the vaccines, and in seven states the achievement under one or all vaccines has been 90 to 99 per cent. Four states, including Bihar, have not achieved even 60 per cent coverage. In the case of pregnant women, the report finds that only six states have achieved the target of 100 per cent immunisation, while five states have not been able to achieve even 60 per cent coverage.

By way of explaining the shortfall the ministry has pointed out the vastness of the programme: that it covers 23 million children who have to be contacted four to five times and 25 million pregnant women. Certainly it is true that the UIP in India is perhaps the largest such programme anywhere in the world. That is all the more reason, however, to ask what the limits of such a programme are in the absence of a good, efficient health infrastructure and a holistic health programme. This is especially important in the context of the new policies which will further enhance the trend to invest in high profile programmes which are supposed to yield visible quantitative returns.

The most telling comment on the limitedness of the technical approach is the report's comment on the reliability of the data. In state after state the CAG has found that reported achievements were far in excess of actual performance when results were cross-checked against records of vaccine consumption. In Karnataka, among the more progressive states in health care, the total quantity of vaccines used during a month/year was less than the quantity of vaccine required for the total immunisation reported in 15 PHCs which were checked. Even in Kerala with its positive health indices, the total number of vaccinations under DPT, OPV and TT exceeded the quantity of vaccines used by as much as 43 per cent in some cases. In Punjab, performance reports in 52 sub-centres were inflated by 9 to 160 per cent. A state core team review in Uttar Pradesh showed that while a 69 per cent achievement had been reported in all districts for all vaccines, only two districts had achieved this performance.

The most telling comment on the programme comes from the report's findings

of serious lapses in aspects such as surveillance, monitoring of preventable disease occurrence and training of staff and information and communication activity. Many states had not even identified surveillance centres and in others they had not started functioning. In 14 states, including Andhra Pradesh, Assam, West Bengal, UP and Bihar, there had been no survey review of infant mortality and morbidity due to these vaccine preventable diseases. Further, in some states, even when polio was reported from the area under immunisation coverage, there had been no investigation.

Training of workers and communication are two aspects which strengthen the quality of the programme and which ensure that the activity of immunising children and pregnant women does not become an end in itself. The programme could also be used as an opportunity for health education. It is precisely these aspects which have been grossly neglected. The report finds that few of the PHCs maintain records on training, which would indicate that this is among the neglected aspects. Targets without supportive programmes of education can have disastrous effects on the entire preventive and promotive programme.

CONGRESS

Convenient Morality

HUMAN resources development minister Arjun Singh is an innovative tactician. He knows well how to embarrass his double leader—as prime minister and party president—without breaking any formal rules. After the setback he suffered in his well orchestrated Surajkund AICC adventure over the demand for P V Narasimha Rao's relinquishment of one of his dual posts, he has this time come out with the suggestion that the Congress(I) should own up its moral responsibility and apologise for its failure to prevent the demolition of the Babri Masjid. The demand has certainly much to recommend itself. However, it raises not a few relevant questions as well.

First of all, why has it taken Arjun Singh about half a year to raise this sensible demand? There was never any doubt about the fact that the union government's conduct vis-a-vis the mosque demolition objectively amounted to colluding with the Sangh parivar's criminal actions at Ayodhya.

Secondly, why has Arjun Singh picked the Babri Masjid affair only? Do not the Rao government and the Congress party owe apologies for some other similar criminal failures? For instance, the failure to curb the Shiv Sena bloodbath in Bombay? As also for the failure to book the self-proclaimed perpetrators of the murders and mayhem?

More pertinently, does this moral responsibility begin with the Narasimha

Rao regime specifically to suit Arjun Singh's sparring for his own personal and factional advantage? In other words, would he care to extend his moral-ethical posture to the late Rajiv Gandhi's time? To demand the regime's and the party's apologies for their failure to protect the lives and properties of innocent Sikh people in New Delhi from murderous Congress(I) gangs? Is he prepared to stand up to the *ancien regime's* 'loyalists' in the party and carry forward—indeed backward in time—his moral-ethical crusade in the party circles? If indeed he would do so, he would come out as a knight in shining armour. Otherwise, he would be regarded as a charlatan in a moralist's cloak.

HINDUTVA

Deja vu

A correspondent writes:

THOSE who are drawing parallels between what is happening in India today with the rise of Nazism in Germany are too often accused of being simplistic or Euro-centric. But hair-splitting quibbles over the exact definition of the Sangh parivar's strategy and tactics belong to the safe area of academic and semetic discourse for future historians. Right now in our country, people with a sense of history suffer from an eerie feeling of *deja vu* when they listen to the BJP leaders, and they cannot but remember with fear the rhetoric that accompanied the rise of Nazism.

Take for instance the recent statement of the former UP chief minister and senior BJP leader Kalyan Singh at a meeting in Patna where he advocated the creation of an 'Akhand Bharat' by annexing ('re-integrating', in his words) Pakistan and Bangladesh to India. The ideological roots of this assertion are embedded in the philosophy of his leader, Guru Golwalkar of the RSS, who in his *Bunch of Thoughts* propounded his organisation's expansionist designs by claiming Afghanistan, Iran, Burma and Sri Lanka as a part of 'Akhand Bharat'. This is how Hitler started—by laying claim to adjoining territories—and drew his country into an apocalyptic adventure.

The parallels do not end here. Another member of the Sangh parivar, Bal Thackeray of the Shiv Sena, when faced with the complaint that Indian Muslims were beginning to feel like Jews in Nazi Germany, retorted, "Have they behaved like the Jews in Nazi Germany? If so, there is nothing wrong if they are treated as Jews were in Germany" (in his interview with the *Time* magazine, January 25). Thackeray's unabashed defence of his emulation of Nazi methods to solve the 'Muslim question' in India again has its roots in the philosophy of Guru Golwalkar. Writing in 1939, during the height of Nazi terror, he was all praise for

Germany for keeping up the "purity of the race and its culture" by "purging the country of the semetic races—the Jews". He followed this up with the observation: "Germany has also shown how well nigh impossible it is for races and cultures, having differences going to the root, to be assimilated into one united whole, a good lesson for us in Hindustan to learn and profit by". Hitler's gas chambers were needed to preserve the purity of his 'race and culture'. His Hindu followers, in order to 'purge the country of Muslims' have to organise massacres in Bombay, Surat and other parts of the country.

The parallel can be extended to the role of the state too. Just as in the late 1920s, the German state allowed itself to be bamboozled by Hitler into conceding his demands, the present Indian government is at times a silent spectator of—and quite often, an active accomplice in—the massacre of members of the minority communities by the Sangh parivar.

Terms like 'fascism' or 'Nazism' may not have indigenous equivalents in our vocabulary. But that does not mean that the behaviour pattern implied by those terms is alien to certain sections of Indians. By adopting the brutal tactics from the Nazi past, and soldering them to a Khomeini-type ideology of religious divisiveness and aggressive intolerance of dissent of the present times, Hindutva is becoming the Indian version of Nazism.

HUMAN RIGHTS

Indonesian Way?

WHILE a bill on human rights is on the parliamentary anvil and the powers that be along with their international patrons have been engaged, with a lot of fanfare, in 'promoting' human rights in the country, the actual developments at the ground level are revealing more and more blatant violations of these precious rights. One does not have in mind merely the cases in the Kashmir valley or the state of Punjab, about which there is no hide-and-seek in any quarters. The present piece has its focus on the Punjab police's recent exploit in Calcutta.

A plain-clothes commando unit of the Punjab police some days ago raided a slummy hutment in a sleepy area in east Calcutta in the early dawn and riddled a Sikh couple with bullets, before escaping with their bodies in a car without a trace or a trail. Some Calcutta newspapers lauded this 'exploit' as evidence of the high efficiency of the Punjab police outfit and the corresponding inefficiency of the West Bengal police. Initially, the Punjab police itself acknowledged the action and claimed the 'credit' it supposedly merited. The union home ministry, however, with a better understanding of the implications of this action, revealed some uneasiness. The West Bengal Left Front government also was muted in its reactions and recorded some mild protest against the encroach-

ment of its jurisdictional preserve by the Punjab police without its knowledge and approval.

More recently, however, the champions of such derring-do are having second thoughts. Though the Punjab police, says *The Telegraph's* Chandigarh correspondent, "are behind the May 17 killing of the Sikh couple in Calcutta, they will not admit it because an FIR has been lodged by the Calcutta police". "The men involved", he continues, "will be charged with murder", particularly as a woman against whom the police had no charges at all has also been wantonly gunned down. The Left Front government and some of its admirers are annoyed, it seems, more because of the Punjab police's violation of West Bengal's jurisdiction. They are yet to condemn the illegal and brutal murders.

This is no isolated case. *The Telegraph* report adds: "The union and state home ministries are flooded with complaints from many states besides West Bengal, including Gujarat, Himachal Pradesh, Jammu and Kashmir and Uttar Pradesh against the high-handedness of the Punjab police."

It is a pity that even human rights organisations have not reacted to this atrocious event as strongly and as widely as they should have. This failure may pave the path for India's going the Brazilian or Indonesian way, where the police in mufti regularly undertakes the liquidation of people whose colour of the eye or shape of the nose they may not fancy.

POLITICS

Just Deserts

GIVEN the Congress tradition, Narasimha Rao and his cohorts should now shift the venue of their aborted AICC session to Tirupati or some such pilgrimage centre. A display of penitence and propitiation of Hindu deities may be on the cards with the 'secular' ruling party keen to overcome both the natural disaster that reduced its proposed extravaganza in Amethi to a fiasco, and the man-made disaster that spelt ruin for its candidates at the recent by-elections.

Gandhi blamed human sins for the Bihar earthquake. His followers who may be looking for sins to explain the Amethi squall, need not go far in their search. The misdeeds committed by the Congress leaders constitute a rich corpus of what can be regarded as sins by any religious standards. The moot question is whether the Congress leaders are prepared to acknowledge as a sin—even by their own heavily Hindutva-oriented standards—their action in making the UP administration take away the farmland of 500-odd families of Amethi and nearby villages to construct the fancy township for the AICC session there. The affected farmers do not know whether their land buried

under the slushy debris of the huge pandal can be salvaged for ploughing again. They do not know also whether they will be able to identify their old individual plots, all of which have been ironed down beyond recognition into one vast stretch of asphalt roads and a flattened space for the 'tamasha' of the Congress leaders.

People in other parts of India too chose to punish the Congress sinners. If the recent by-election results are any indication, the popularity of the Congress appears to have taken a nose-dive in some of the major states like Gujarat, Bihar and Andhra Pradesh. While in Gujarat, out of the six constituencies it has lost to the BJP in four, in Andhra Pradesh in both the constituencies where elections were held, the Telugu Desam won. In Bihar, the Congress candidate for the prestigious Patna Lok Sabha seat lost his security deposit.

It is not as if the political parties which defeated the Congress in these elections are any better than the Congress. While the BJP has established its notoriety as a murderous force, both the Telugu Desam and the Janata Dal have managed to emulate the Congress in skulduggery. But the popular verdict in favour of these parties suggests the complex psyche of the voters who in some areas may be swayed by the appeal of 'Hindutva', and in some other areas by a pure hostility towards the Congress which during the last crucial months has made a mess of everything—whether the Ayodhya tangle, the charges of corruption against a Supreme Court judge or Kashmir.

Those among the Congress leaders who are trying to salvage the party's image present a pathetic picture. Arjun Singh is suggesting that the party offer an apology for the destruction of the Babri Masjid—to woo back the minority vote bank. If Arjun Singh is all that concerned about the hurt sentiments of the Muslims only (although some Indian citizens of other religious beliefs were also hurt by the demolition of the Babri mosque), he should have the courage to demand the punishment of the prime minister himself and his cronies who connived at the demolition, instead of suggesting a ritual modelled on the Catholic practice of Friday confessions. His other party colleagues are busy wooing the Hindu vote bank by soliciting the services of the notorious godman Chandraswami to organise a 'yagna' to counter the 'sants' and 'mahants' of the Sangh parivar in Faizabad.

The atavistic search of the Congress today for salvation through religious regression is partly a continuity of the Hinduism-oriented tradition with which the Congress got identified, and partly reflects the present ideological crisis of the party which has failed to formulate and put into practice a concept of secularism tuned to the complex Indian situation.

TWENTY YEARS AGO

EPW, May 26, 1973

Since the days of the British the top echelons of the bureaucracy and the police have never had any doubts about their dispensability to the political rulers who themselves have, in recognition of this fact, heaped on these functionaries perquisites and privileges to mark them out from the masses as well as from the rank and file of their own services. However, this method of managing the bureaucracy and the police through an elite officer cadre appears to be losing some of its effectiveness. Here again the higher educational levels of the new recruits may be one material factor; another may be the very real distress imposed on the lowest levels of these services by economic stagnation and inflation. One of the significant aspects of the mutiny of the PAC in UP was the intense resentment against their superior officers among the ordinary constables and head-constables it brought to light. Elsewhere too the demand for a wider diffusion of the tangible rewards of indispensability must be growing among the police forces.

The government's immediate riposte to the rebellion of the PAC in UP will be expectedly harsh, but after the more active participants have been individually dealt with, something would have to be done to mollify the rank and file of the PAC. Whatever form this takes, the result would be a further increase in expenditure under the head 'police' in the state budget.

The prospect, clearly, is one of continuous expansion of the size of the cake devoted to keeping the defence and police forces in good humour. It has been estimated that already what the central and state governments spend on these forces exceeds their total developmental expenditure. The process has a self-sustaining quality about it: the less that is spent on development, the greater the government's dependence on the forces of law and order and the larger the expenditure on them which in turn leaves less for development. The Planning Commission's 'Approach' sports two models of development, described as 'variants', for the Fifth Plan: one promising growth and the other promising growth plus more equitable distribution. To the list may be added a third 'variant' under which there is little growth and no redistribution but which seeks to take care of the adverse consequences of these deficiencies by larger and larger expenditure on the forces of law and order. It may be too cynical to suggest that, the Planning Commission's own preferences notwithstanding, this is the real 'preferred variant' of the political rulers. But it may not be at all far-fetched to prognosticate that this is the 'variant' which is most likely to prevail in practice.

Shree Pacetronix

SHREE PACETRONIX is taking to manufacturing cardiac pacemakers, after having traded in them since the year 1989. Technology for the manufacturing operations is being provided by Bio-Pace Technology of the USA, which is a pioneer like Bio-Control Technology and Cardio-Pace Medical in the manufacture of cardiac pacemakers. BPT will be manufacturing the pacemakers for the Indian market. The project is appraised by State Bank of Indore to cost Rs 3.78 crore. Of this Rs 1.15 crore is the technical know-how fee payable to BPT. Expenses on foreign technicians are estimated at Rs 1.21 crore. BPT will be having a 6.7 per cent stake in the Indian company, which is issuing equity shares worth Rs 2.09 crore to the public in 10-rupee shares at par. The issue opens on June 8 with State Bank of Indore and CRB Capital Markets acting as the lead managers. The company is also issuing 38,000 shares to NRIs. The promoters are contributing Rs 80 lakh. The rest of the financing of the project is to be done with a term loan of Rs 59 lakh from the Madhya Pradesh Audyogic Vikas Nigam and capital subsidy of Rs 10 lakh. The project at Pithampur, MP will have a capacity of 4,800 numbers of cardiac pacemakers. Trial runs have been taken in May and production is to start in June. The company will be manufacturing non-programmable pacemakers and programmable pacemakers. The non-programmable ones will be available at a price of Rs 11,000 and the programmable ones at Rs 22,000. The cost of the imported machines comes respectively to Rs 20,000 and Rs 35,000. Demand in India during 1993-94 is estimated at 8,000 machines. BPT is to buy up 30 per cent of Shree Pacetronix's annual production for a period of five years. The company will work at 50 per cent capacity in 1993-94, at 60 per cent in 1994-95 and at 70 per cent in 1995-96. It will have sales worth Rs 3.30 crore, Rs 3.96 crore and Rs 4.62 crore respectively for the three years with expected profit after tax at Rs 44.03 lakh, Rs 56.38 lakh and Rs 1.11 crore and EPS of Rs 1.42, Rs 1.84 and Rs 2.34.

Ram Leather Exports

Ram Leather Exports, incorporated as a private limited company in 1988, started manufacturing leather shoe uppers in 1991 in Pondicherry, exporting them to

Italy. It is now setting up capacity for manufacture of shoes and leather garments of 500 pairs and 150 pieces, respectively, besides 900 purses and 150 handbags, per day, all for exports. The project is appraised by Bank of Baroda to cost Rs 4.75 crore to meet which the company is issuing 40 lakh equity shares of Rs 10 each at par and offering 23.40 lakh shares to the public and 10 lakh shares to the NRIs. The issue is opening on June 9 under BoB and Indbank as lead managers. The company's present share capital is Rs 60 lakh while it enjoys with BoB working capital facility of Rs 75 lakh. As the project goes into production it will be taking up the present production of shoe uppers so far exported. For exports, the company plans also to enter the market in Germany, while it has appointed Lampomacchine International of Italy as its marketing agent in Europe and the US. The company is promoted by T S Janaki Raman and others. The projections of sales with increase in capacity utilisation from 60 per cent to start with to 80 per cent subsequently for the three years 1993-94, 1994-95 and 1995-96 are Rs 11.96 crore, Rs 13.95 crore and Rs 15.95 crore, respectively, and those of net profit Rs 1.01 crore, Rs 1.35 crore and Rs 1.70 crore. The project is to start on two-shift basis from the middle of June in order to make up for a delay of some two months.

Asian Alloys

Asian Alloys, promoted by Pawan Sachdev and manufacturing special steel castings and ingots at Fatehgarh, Punjab, is another company to be in the market on June 9. It is issuing 26 lakh equity shares of Rs 10 each at a premium of Rs 5 per share and offering 17.22 lakh shares to the public under BOI Finance and PNB Caps as lead managers. The capital issue is towards the Rs 5.67 crore project to expand the existing capacity from 21,500 tonnes per annum to 60,900 tonnes per annum. Following the capital issue the company's share capital will stand increased from Rs 80 lakh to Rs 3.40 crore. After a backlog of initial losses was wiped out in 1991, Asian Alloys has reported for the year 1992-93 increase in net profit from Rs 23.10 lakh to Rs 46.13 lakh with turnover recording a rise from Rs 18.81 crore to Rs 23.43 crore. The cost of expansion project as is appraised by Bank of India at Rs 5.67 crore is to be financed with the proceeds of the capital issue of Rs 3.90

crore (including premium amount of Rs 1.30 crore), term loan of Rs 1.50 crore from the Punjab State Industrial Development Corporation and internal accruals of Rs 27 lakh. The company is making the capital issue at a premium of Rs 5 per share on the basis of the equity's book value of Rs 30.9 and EPS of Rs 5.70 during 1991-92. The expanded capacity is to come into operation in August this year, but optimum production is expected only during 1995-96. Meanwhile, the company has projected a turnover of Rs 39.11 crore, Rs 44.70 crore and of Rs 50.29 crore respectively for the years 1993-94, 1994-95 and 1995-96, with net profit corresponding to Rs 1.54 crore, Rs 1.93 crore and Rs 2.31 crore. EPS for the three years is estimated at Rs 4.52, Rs 5.67 and Rs 6.79, respectively.

Indo-American Cement

Indo-American Cement Corporation, a company making a capital issue of 1.30 crore equity shares of Rs 10 at par on June 8, has the name American to it to the extent that its plant and technology are approved by the Construction Technology Laboratories, USA. The same are, however, being provided by Pittie Cement and Industries, an existing company in the field. The supply of the same by Pittie Cement for Indo-American Cement have been approved by the American company for the use of vertical shaft kiln (VSK) technology for setting up what is to be the world's largest cement plant based on this technology. While Pittie Cement is also to lend its marketing facilities, the requirement of limestone of Indo-American Cement are to be sourced from the quarries of Pittie Minerals and Metals. The promoters, Rajeev Bhansali, Anil Mehta, Arun Goel and others, have sought this arrangement as new-comers in the field. The company is setting up three cement plants of 200 tonnes per day capacity to manufacture annually 1.80 lakh tonnes of cement using VSK technology at a capital cost as low as Rs 892 per tonne of cement compared to the industry's present average of Rs 2,500 per tonne. The project, located at Jodhpur in Rajasthan, besides, is to have a short gestation period, as it is expected to go into production in August this year. In addition, a 15 per cent dividend is forecast in the very first year of production; the rate is expected to be 20 per cent two years later for 1995-96. The project is appraised by United Bank of

India to cost Rs 16.05 crore. Much of this is being financed with equity share capital of Rs 13 crore (promoters contributing Rs 3.25 crore), while of the balance amount Rs 2.10 crore is to come from lease and hire purchase of machinery and Rs 75 lakh by way of deferred payment. During 1993-94, the project is to work 200 days to yield Rs 13.95 crore of turnover and Rs 2.72 crore of net profit with annualised EPS of Rs 3.13. The turnover and net profit for 1995-96 are projected at Rs 23.72 crore and Rs 3.90 crore, respectively. Out of the capital issue of 1.30 crore equity shares, the company is offering 78 lakh shares to the public and 19.50 lakh shares to the NRIs. The issue opens June 8 under SBI Caps and Weizmann Industries as lead managers.

Namaste Exports

Namaste Exports, currently engaged in the manufacture of finished leather, leather garments, leather goods and textile outerwear, is embarking upon an integrated project covering modernisation of the tanneries, expansion of leather garment and textile outerwear manufacturing facilities and also diversifying into shoe manufacturing activity by establishing

facilities for the purpose. The total funds requirement for undertaking the expansion programme has been estimated at Rs 30 crore by State Bank of Mysore. To raise this amount, the company is entering the capital market with a public issue of Rs 30 lakh equity shares of Rs 10 each at a premium of Rs 90 per share aggregating Rs 30 crore. The company is promoted by K Narayana Bhat and his wife, Madhura N Bhat. The company's sales turnover at Rs 2.88 crore in 1984-85 rose to a staggering Rs 53.56 crore in 1991-92. That for the year ended March 1993 is Rs 74.55 crore (unaudited). In 1991-92, besides the award for the highest export of leather garments, the company has won a special plaque for overall export of leather and leather products from the Council for Leather Exports, Madras. It has also got the 'trading house' status conferred by the ministry of commerce, government of India. The expansion/modernisation of the tanneries and textile outerwear will be completed next month and the shoe manufacturing unit will start commercial production in October 1993. The issue opens on June 24. Listing of the shares will be on the Bangalore, Bombay and Delhi stock exchanges.

—JK

COMPANIES

Uncertainty over Fertiliser Price Policy

Jairaj Kapadia

WORKING of Varinder Agro Chemicals has gone haywire because of uncertainty in government policies for the fertilisers industry. The directors call this a transient phase and are hopeful that the uncertainty would be ending soon and there would result a higher offtake of single super-phosphate fertilisers which the company manufactures. However, operations for the period from April 1991 to June 1992 have been much affected by the unsettled government policies. At the same time, while in order to finance its ongoing writing and printing paper project by way of diversification, the company has made a further call on shareholders for investment of funds (a rights issue of equity shares at cent per cent premium of Rs 10 per share aggregating Rs 934.50 lakh was made in November 1992), it has exercised waiver of dividend for the 15-month period in review. The directors mention in this connection the financial constraints due to the blocking of huge amounts with

the government against subsidy claims and state they have decided to conserve resources and not recommend any dividend to shareholders.

The previous financial period also was of 15 months, as the company had closed the financial year in March 1991 instead of in December 1990. Then and also now it raised fresh funds from shareholders, having made in that period an issue of partly convertible debentures, which were offered also to the public, and which was followed up with a rights issue of equity shares as mentioned above. In the meantime, the company decided to expand the capacity of the writing and printing paper project at Barnala in Sangrur district, Punjab from 57.50 tonnes per day to 72 tonnes per day, to make the project economical.

Meanwhile, production of SSP fertilisers was 1,00,119 tonnes and of sulphuric acid 60,840.435 tonnes for the 15-month period under review compared to 1,57,253

tonnes and 76,326 tonnes respectively for the 15 months ended March 31, 1991. The turnover for the period under review was Rs 3,799.72 lakh compared to Rs 4,296.45 lakh for the previous period. The fall in production and turnover is attributed by the directors to uncertain fertilisers policies. However, there resulted a surplus profit of Rs 282.19 lakh which together with the previous balance brought forward of Rs 229.91 lakh aggregated Rs 512.10 lakh. All of this amount is carried to the balance sheet. As said earlier, the directors are hopeful of a turn for the better in fertilisers. At the same time, capacity utilisation of the paper project is expected to enhance results and profitability during the current year.

WOOLWORTH (INDIA)

Success Story in Wool

Woolworth (India), a wool tops company, has taken so fine a headstart in the very first year of operations that one wonders how the once famous company in the field, Modella Woollens, has turned sick. Modella Woollens has reached a state of virtual non-redemption, as was denied assistance by Central Bank of India under a scheme of rehabilitation sanctioned by BIFR. As against that Woolworth (India), on successfully implementing the wool tops project and with the spinning unit consistently working at optimum capacity utilisation levels, produced during the year ended March 31, 1992, 8,45,282 kg of worsted yarn and sold a quantity of 9,03,862 kg, thanks to an opening stock of 69,924 kg in hand. The sales realisation together with Rs 4 lakh of waste was of the order of Rs 3,157 lakh. The worsted yarn produced was of high quality and readily accepted in overseas markets in general currency area. Foreign exchange earnings for the year were of the order of Rs 3,153 lakh and exceeded foreign exchange outgo amounting to Rs 2,228 lakh.

The company has been granted the coveted Woolmark by the International Wool Secretariat, UK. With the excellent response to the quality of the products, the operations for the year 1992-93 are expected to be still more encouraging.

Meanwhile, after the wool tops spinning plant, the silk division was at an advanced stage of implementation during the year under review. It has a split location—the degumming unit is at Malda in West Bengal and the spinning unit is at Raipur in Madhya Pradesh. The Malda unit and the silk tops unit at Raipur have since gone into production. With the spinning unit following suit, the company is to have started commercial production of spun silk/coil yarn. An expansion programme was also under way during the year of the worsted spun yarn 100 per cent export-

oriented unit to double existing production capacity during 1992-93. The company has a licensed capacity of 787 tonnes of worsted yarn, 136 tonnes of silk spun yarn and 209 tonnes of coil yarn.

During 1991-92, there were earned export incentives of Rs 139 lakh while the company made a gain of Rs 163 lakh from foreign exchange fluctuations. These form part of 'other income' for the year. The figure of cash and bank balances which swelled from Rs 515 lakh to Rs 4,155 lakh includes remittance in transit of Rs 174 lakh and receipt on debenture application account of Rs 3,775 lakh as against which equity share application refund account has stood reduced from Rs 474 lakh in the previous year to Rs 23 lakh. The debenture application account is due to a rights issue to the shareholders of 35,22,600

12.5 per cent partly convertible debentures at Rs 90 each, besides to the employees, workers and Indian working directors, aggregating Rs 3,170.34 lakh. The issue was made to provide required finance for the 100 per cent export-oriented worsted spun yarn expansion project at Raipur and the spun silk/coil yarn project being implemented at Malda in West Bengal and at Raipur. The rights offer received overwhelming responses from the shareholders and the issue was oversubscribed with 15 per cent of oversubscription retained by the company.

WYETH LABORATORIES

Cost Rise Contained

Preliminary results announced by Wyeth Laboratories for the year ended March 31, 1993 have shown growth in sales in gross figures from Rs 2,892 lakh to Rs 3,383 lakh with a sharp rise in gross profit from Rs 302 lakh to Rs 491 lakh and increase in net profit from Rs 141 lakh to Rs 242 lakh. As the full report of the year's working is awaited and will be available some two months later, the improved results have followed the better outturn by the company for the previous year ended on March 31, 1992.

Growth in sales during that year was pronounced at 37.1 per cent, the gross amount increasing from Rs 2,109 lakh to Rs 2,892 lakh, while profit before tax registered a smaller rise of 16.6 per cent from Rs 230 lakh to Rs 268 lakh. As the directors have explained in their report, that was because of the adverse impact of the inflationary pressures and the inordinate delays in receiving from the authorities adequate cost compensatory selling price revisions for the end products. As profits have now perked up by almost 72 per cent, it appears the company has been successful in surmounting those pressures.

If so, this is refreshing. For the directors in their report for the year 1991-92 had talked of the pharmaceutical industry going sick after it had remained an 'unfortunate exception' to the liberalised industrial policies which the government had still not extended to this industry. However, the situation has turned better now, though the new drugs policy is still taking time to be announced. Meanwhile, during 1991-92, Wyeth Laboratories turned a net earner of foreign exchange with exports made of high technology bulk steroidal intermediate and formulations of an order of Rs 367 lakh against Rs 114 lakh in 1990-91. The foreign exchange outgo, including Rs 293 lakh for import of raw material, was Rs 315 lakh.

India's Report to UN on Human Rights

A G Noorani

The proposed National Human Rights Commission will have no jurisdiction over paramilitary forces and will have no power to hold any inquiries on complaints against the army. It also restricts the definition of 'human rights' to rights enforceable under Indian law. Can such a body be effective in containing human rights violations?

ON May 20, the official spokesman of the ministry of external affairs told the press in the wake of the Mallott visit, that India's "commitment to human rights is second to none". Why then does its action belie its words constantly? No one denies that the Constitution embodies fundamental rights and that our record on human rights, on the whole, is the best in the third world. It is also a fact that to large segments of our society justice is denied and not merely because of economic and social reasons. Justice is denied partly because the judicial process is slow, sluggish, expensive and yet inadequate, and is moreover, not completely free from the taints of corruption. But the greatest culprit is the executive. The law enforcing agencies are simply not conscious of the concept of human rights generally. The bureaucrats are insensitive. The politicians in power are indifferent if not cynical.

The union home minister S B Chavan's rhetoric on human rights is appalling. On May 14 he moved in the Lok Sabha the Human Rights Commission Bill, 1993 to set up the National Human Rights Commission. It will not have jurisdiction at all over the paramilitary forces. There will be no power to hold any inquiries on complaints against the army and the paramilitary forces. The Commission will simply forward the complaint to the government, hear its response and make a recommendation which may not be published.

The bill restricts the definition of 'human rights' to rights enforceable in Indian law. The Commission can be packed with as many as three secretaries to the government of India out of eight members. Three others will be government appointees—chairpersons of the National Commission for Scheduled Castes and Scheduled Tribes, the Minorities Commission and the National Commission for Women. The chairperson will be a sitting

or formal judge of the Supreme Court. Can such a body inspire public confidence? Even to visit jails it will need permission of the state government like any private citizen.

If the bill is no evidence of earnest nor is the gross and consistent delay on the part of the government of India in filing its periodic report on its observance of the two International Covenants on Civil and Political Rights and on Economic, Social and Cultural Rights. The report on the Covenant on Civil and Political Rights is submitted to the UN secretary-general who transmits it to the Human Rights Committee set up by Article 28 of the Covenant. India satisfied the Covenants only on March 27, 1979 with serious reservations set out in the instrument of ratification. The sum and substance of the reservations is to reduce the scope of the Covenant of Civil and Political Rights to that of the restrictions on fundamental rights in our Constitution.

Not till 1984 was India's first report examined. The second report was due in 1985. It was submitted only on July 12, 1989 after seven reminders had been sent to the government of India. The third report was due on July 9, 1990. It has not yet been submitted though the committee extended the deadline for submission until March 31, 1992. So much for the claim that India's "commitment to human rights is second to none".

It may be recalled that the second report was examined by the committee at New York on March 26 and 27, 1991 when India was represented by G Ramaswamy, the then attorney-general. The members of the committee do not represent governments but are experts who sit in their personal capacity. The grilling of Ramaswamy was commented on widely in the press most notably by Nandita Haksar. In March 1993 Amnesty International published a paper on the examination of

the second report by the Human Rights Committee. The then attorney-general, K Parasaran, appeared before the committee when the first report was examined. Members pointed out to G Ramaswamy that the shortcomings which Parasaran had promised that India would remove continued to persist.

For the first time, the 1992-93 Annual Report of the union home ministry has a chapter on Human Rights (pp 38-41). It says, "there was no specific provision in the Allocation of Business Rules, 1961 for dealing with matters relating to Human Rights as a separate subject. A decision was therefore taken to make such a provision under the charge of the Ministry of Home Affairs. A number of steps were taken by the ministry during 1992 to counter the propaganda..."

It seems that this is the prime aim. There follow references to Amnesty's reports and the government of India's responses to them and to the moves to set up a Human Rights Commission. "A Human Rights Cell was created in the Home Ministry". Discussions on 'Custodial Crimes' are also referred to. The only tangible 'action' was the organisation of a training programme in co-ordination with the National Police Academy 'for sensitising officers' on human rights. UNESCO has a training programme. The UN Human Rights Division in Geneva also provides help in such matters. Not only officers but constables also need to be taught what human rights is all about. We are told that states have been advised to set up human rights cells to monitor and follow up "cases of alleged human rights violations by the law enforcement agencies".

The home ministry report refers to the visit in November 1992 by an Amnesty International delegation. "The visit marked the start of a constructive dialogue with Amnesty International, which is proposed to be continued in the same spirit." The next step should be to allow Amnesty's representatives to visit Kashmir—especially since our commitment to human rights is second to none.

Panchayats and Left Politics in West Bengal

Poromesh Acharya

Despite the apparent 'success' of panchayati raj in West Bengal under Left Front rule, the overall domination of the privileged classes over the rural power structure remains unchallenged.

WEST BENGAL is going for another panchayat election by the end of May 1993. The Left Front is sure to win the election with an overwhelming majority. West Bengal has a three-tier panchayat system. On June 4, 1978, after 14 years, direct elections were held to elect 56,000 representatives for 15 zilla parishads, 324 panchayat samitis and 3,242 gram panchayats under the West Bengal Panchayat Act, 1973. According to the provisions of the 1973 Act, panchayats will have their normal terms of four years. It is to the credit of the Left Front government that panchayat elections are being held regularly since 1978.

Democratic decentralisation through panchayats as a means to usher in a new social order for the socio-economic transformation of the rural community of West Bengal has been accepted by the Left Front government as a state policy. Promode Dasgupta, the first chairman of the Left Front, stated, "it is a struggle for establishing the rights of poor peasants, agricultural labourers, village craftsmen, etc, against the vested interest and exploiting classes in the villages". He further observed that through panchayat elections, power will be decentralised and with the organised force of the village poor and middle class Left unity can only carry out the task of establishing the power of poor curbing the power of the administrative officers in the villages. In this connection, one may recall the political resolution adopted at the 10th congress of the CPI(M) held in Jullundhur in April 1978 which stated that the basis of united kisan movement shall be "the agricultural labourers and poor peasants, departing from the past practice of mainly basing on the middle and rich peasants". Implicit in it is the question of hegemony and empowerment of labouring people.

Looking at the performances of panchayati raj in West Bengal since 1978, one may wonder if all these were not only pious wishes. No doubt, there emerged a new generation of leadership in rural West Bengal but the class and caste background of the new leadership may not have changed much.

There developed a new institutional structure, decentralised in form but still dominated by the middle and rich peasants. The agricultural labourers and poor peasants, though not in proportion, have their representatives in the new structure but their participation in the decision-making process is still a far cry.

It may be true that the power of government officials has been curbed considerably. In fact, 'sahadipathies' of zilla parishads now wield the supreme power in the district. The sahadiopathi, like the chief minister, governs over all the affairs of development and administration in the district. The district collector plays generally, if not a subordinate, a secondary role. Similarly, the sahadiopathi of the panchayat samiti has overall control over the affairs of the block. It is interesting to note that almost all the sahadiopathies belong to the upper strata of rural society with a bhadralok background. A few of the sahadiopathies of panchayat samitis may be from the lower castes but not necessarily from lower classes. The most important question, however, is the class character of the district party leadership. In a system of so-called democratic centralism it is the party secretary who holds the ultimate authority, though there may be a few exceptions. And a party secretary with a labouring background is unusual. The overall domination of the privileged classes over the decentralised power structure as a result remains without being seriously challenged.

At the gram panchayat level there may be quite a number of members and pradhans from poor and lower middle peasants. However, this could not bring about any radical change at the grass-roots-level leadership. Usually, the pradhans and members from the labouring classes are guided in decision-making by somebody from the party who generally belongs to the upper strata of the rural society. More interesting is that representatives from the labouring classes soon start imbibing the characteristics of the leisured classes. In many cases even their

life-style changes in no time. In fact, they become 'declassed' in a reverse way. It is difficult to prove that the decentralisation of the power structure through the introduction of panchayati raj could achieve the goal of empowerment of the labouring people and establishment of the hegemony of the labouring classes over the village society.

LAND GRAB MOVEMENT

It may be necessary to discuss the issue a little more elaborately. To my mind, empowerment of labouring people as a process entails two very significant aspects. It requires getting rid of old inhibitions on the one hand, and acquiring critical awareness on the other of one's status in the social complex leading to a solidarity movement for structural change of the society. It is the age-old docility of the labouring classes in general that allowed the landowning classes to dominate over them. The religious traditions and customs played an instrumental role in keeping the labouring classes in an agrarian society docile without much coercion. Getting rid of this docility is therefore the precondition for empowerment of the labouring people. The process, however, remains not only incomplete but may degenerate if not carried further towards logical fruition. For establishing the hegemony of the labouring people over the society as a whole, it is necessary to organise a solidarity movement based on *enlightened participation*. A solidarity movement for land reforms and counter-education is crucial for carrying out the task. It is unfortunate that the question of counter-education never got its due importance in the agenda of the kisan movement in our country.

The Left Front in West Bengal also failed miserably in carrying out the task. The total literacy campaign initiated by the National Literacy Mission gave the Left Front a golden opportunity in this regard. In their futile zeal to claim total literacy, the respective Zilla Saksharata Samitis missed the spirit of functional literacy and reduced the campaign into a Laodicean exercise. It is no wonder that the first district of West Bengal which had claimed to have achieved the goal of total literacy admitted recently that about 50 per cent of neo-literates had reverted to illiteracy.

It is interesting to recall in this context that the land grab movement launched during United Front government rule in the late 60s helped the labouring classes of rural West Bengal to get rid of their age-old docility to a large extent. The red flag became the symbol of struggle for

emancipation from the yoke of oppression. It was no wonder that the Left Front won successive elections with the massive vote of the rural labouring people. The Congress on the other hand never even thought of taking up the causes of labouring people and is generally looked upon as the party representing the interests of the rural elite. However, coming to power in the 70s the Left Front neglected to carry out the incomplete process started during the United Front rule.

GIFT FROM ABOVE

It is all the more interesting that Operation Barga, the only significant achievement of Left Front, was more a gift from above. The operation was carried out mainly by some committed bureaucrats with the support of bargadars and the state-level party leadership, particularly Promode Dasgupta, the Left Front chairman. The role of bargadars in the operation was that of rather passive participation, notwithstanding the long tradition of barga movement including the historic Tebhaga movement. One may recall in this connection that it was the Flood Commission which had first upheld the cause of bargadars and recommended the restoration of John Kerr's bill to treat as tenants bargadars who supply cattle and agricultural implements and to stipulate the share of crop recoverable from them to be one-third instead of half. However, it did not recommend extending of occupancy rights to the bargadars. It is Operation Barga which ensured the occupancy rights to the bargadars.

In between the land Revenue Commission's report recommending one-third share to bargadars and Operation Barga ensuring occupancy rights, much water has flowed through the Ganges. A vigorous peasant movement ensued after the recommendation of the Land Revenue Commission. As a result, Bhagchas Boards were constituted for settling disputes of crop-sharing between landowners and sharecroppers. In the 50s and 60s one of the major issues of the Krishak Sabha movement was against the eviction of bargadars for refusing to part with half of the produce as had been in vogue earlier. Operation Barga may be said to have been the culmination of the process. Meanwhile the zamindari system had been abolished and big occupancy ryots and rent-paying tenure holders emerged as the elite groups in rural society.

What Rabindranath Tagore said in a discourse with Pramatha Chawdhury, a bhadralok and a renowned Bengali author, on the question of allowing proprietary rights to occupancy ryots proved to be true. Pramatha Chawdhury has not been proved to have been wrong either. Tagore feared that the proprietary rights

would only expose the poor ryots who did not know how to protect their interests to the greed and cunning of unscrupulous usurers and moneylenders. He argued that during the tyranny of indigo traders, the Bengal zamindars had protected the rights of ryots. He believed that those among the ryots who knew how to protect themselves were even more dangerous and were likely to devour others. In the process, one day they would emerge as the new zamindars by taking recourse to all sorts of fraud and merciless cunning. He even expressed his doubt about the protective ability of law. There were expert lawyers to be employed by the big land grabbing ryots and who were out of reach of the petty ryots.

Pramatha Chawdhury argued that the Permanent Settlement had in a way robbed the Khudkhasht ryots of their traditional rights to land and transferred the proprietorship to a class of people who had never before enjoyed such rights. Zamindars before the Permanent Settlement were the collectors of revenue on contractual basis. Besides, zamindars under Permanent Settlement, notwithstanding a few exceptions, were no less oppressive. Proprietary rights to ryots as proposed would only deprive the zamindars of the unearned income they used to make by way of extorting a fee, from the ryots on transfer of occupancy rights. Transfer of occupancy rights on payment of a fee to the zamindars was already in vogue. He concluded that zamindars had no moral right to be the guardians of the ryots and as such had no moral right to oppose conferring of proprietary rights to the ryots, even if some of them fell prey to cunning fellow ryots or unscrupulous usurers and village moneylenders. They are after all adults and have the right to manage their own affairs.

He, however, opined that some protective clauses could be included in the law. To describe the condition of Bengal ryots he referred the novelist Bankim Chandra Chattopadhyay and a leader of zamindars, Bomkesh Chakravarty. According to Bankim Chandra, peasants of Bengal were suffering from three malaises, namely, poverty, illiteracy and slavery. He held the zamindari system largely responsible for the sorry plight of the Bengal peasants. Even Bomkesh Chakravarty admitted that 70 per cent of the peasants of Bengal went to bed without having two square meals. Surprisingly, Pramatha Chawdhury noted that but for the munsifs and petty government officials, the Bengal peasants would not have been able to survive. It was not the zamindars, nor the lawyers and politicians whom the zamindars patronised, but the government officials who somewhat protected the interests of the peasants. The observation may not be altogether wrong. However, Pramatha Chawdhury advocated the

cause of ryots from a liberal point of view to uphold the norms of civil society. He was apprehensive of a communal upheaval and wanted to forestall that.

Pramatha Chawdhury endorsed the demands raised in a big meeting of Bihar ryots held at Muzaffarpur. The demands were: (1) compulsory primary education; (2) one charitable health centre at a gap of every four miles; (3) right to transfer by sale occupancy holdings; (4) rights over trees on occupancy holdings; (5) rights to dig ponds and build pucca buildings; and (6) occupancy rights be made permanent with fixed rents ('maurasi' and 'mokrari').

Is it not interesting to note that except in Kerala, the first two demands have not been fulfilled in any state even after 45 years of independence and about 40 years after the abolition of the zamindari system? One may not be sure also if the social and economic conditions of the rural poor have undergone any radical change.

PARTY BUREAUCRACY

Tagore rightly observed that there would emerge a class of landholders no less oppressive after the abolition of the zamindari system. Chawdhury did not deny the possibility but recognised the inevitable course of history and wanted to pre-empt a bloody confrontation. It can reasonably be said that notwithstanding the Barga operation, the 14 years of panchayati raj could hardly bring about any change in agrarian relations basically different from what the liberals like, what Pramatha Chawdhury had endorsed many years ago. No doubt, there developed a decentralised structure of institutions which curbed the power of officialdom to a large extent. But how far that could ensure the emergence of an alternate leadership in terms of class and caste may not be beyond doubt. One may even question if the political power structure could be functionally decentralised under a centralised party structure.

There may be some truth in the otherwise somewhat exaggerated contention that it is the party bureaucracy which now holds power in rural West Bengal. Traditional village solidarity guided by village society norms which gave birth to the panchayati raj concept has already been destroyed and replaced by party solidarity wrongly construed to be class solidarity. In fact, after the Barga operation, there was hardly any issue for mass mobilisation and mass contact except periodical electoral exercises, and as such a situation of inertia has prevailed which was a fertile ground for the development of bureaucracy in the party. It was the Total Literacy Campaign which became an issue of mass contact after a long gap.

To my mind, the Left movement in West Bengal reached its peak in the late 60s and early 70s and then it slid down to a point of almost no return. It may not be unreasonable to say that the most important organised movement of the labouring peasants with an element of spontaneity was the land grab movement launched during the United Front rule, notwithstanding the aberrations which ought to have been avoided. It was perhaps far more significant than any other peasant movement, including the great Tebhaga movement.

For the first time, there was a slogan which caught the imagination of the labouring peasants, particularly the landless labourers, and the response was almost universal. The movement spread to almost all parts of rural West Bengal like wild-fire. The extent of active participation of the labouring classes was simply unique. Unfortunately, no attempt has yet been made to study the import of the movement systematically. However, it can be said without fear of contradiction that this movement brought in very significant changes in the pattern of conflict negotiation in rural West Bengal. The labouring peasants recovered from one of the malaises referred to by Bankim Chandra, namely 'slavery'. No longer could they be taken for granted. Getting rid of the age-old docility they now were prepared to take the offensive, while the jotedars and rich peasants were pushed to a defensive position. Even the repression unleashed by Congress rule after the fall of the United Front government could not reverse the process. Unfortunately, the Left Front after coming to power failed to complete the process, maybe, for fear of losing governmental power.

Jotedars and rich peasants, however, realised soon that the overt method of domination they were used to had to be changed and a new strategy had to be adopted. They conveniently changed their colour and in no time penetrated into the local-level leadership of different Left parties, including the CPI(M). There may be some truth in the joke that class struggle is over, now there is struggle of colour. It is interesting that most of the violent clashes that have taken place in rural West Bengal during the last 10-12 years have been by and large inter-party clashes, often among the Left parties, even if the bone of contention was land. There may even be more casualties in inter-party clashes than in land disputes. The penetration of jotedars, rich peasants and a number of unscrupulous persons in the local level party structure has given rise to a different sort of vested interest against which Promode Dasgupta had declared war. It appears now that the Left parties have been trapped into a situation from

which it would be very difficult for them to come out without large-scale purging of party members, which again may adversely affect their electoral prospects, at least for the time being.

ELECTIONS VS IDEOLOGY

It is apparent that Left Front wins election at the cost of ideology. In fact, it is the negative votes which now decide the fate of the Left Front. In the absence of any organised opposition which has a strong ideological base or any programme to invoke the imagination of the people, the Left Front may not face any real challenge in the foreseeable future. West Bengal Congress is an organisation of discredited individuals without any alternative programme or ideology and as such hardly has any electoral prospect in the near future. The only other opposition party with a significant following is the BJP. To my mind, BJP is likely to come

up soon as a party to be reckoned with. It is a party which has an ideological basis and with slogans to catch the imaginations of even the labouring classes of a particular religion, however, dangerous might be these slogans.

To my mind, it is the BJP which is likely to put up a real challenge to the Left Front and to the ideology of leftism ultimately. The influence of BJP is growing in rural West Bengal, but is yet to be visible in organised shape. Even in the rank and file of the Left Front, the influence of BJP is traceable. The recent communal disturbances are cases in point. The involvement of the local Left Front workers in the communal conflicts is no longer any secret. It is only a matter of time before communal politics takes over, pushing class and caste politics to the back-seat. In West Bengal the Left Front can counter this possibility if only they could rise to the occasion, getting rid of the inertia they are suffering from.

Caste, Class and Agrarian Movements in Bihar

Krishna Chaitanya

Two recent killings in the flaming fields of rural Bihar point towards the dynamics of agrarian mobilisation and its success in overcoming the question of caste-class contradiction and the new alignments taking place in the countryside of Bihar.

LAST year, on August 14, a day just before the 40th anniversary of the country's independence, the people of Bihar had woken up to find their favourite newspapers informing them with screaming headlines that the 'naxalites' have once again struck at Ekwari, the village, the very mention of which, once used to send shivers down the spines of the members of the ruling classes and their lackeys, the middle class, alike.

But the sense of unease which the 'educated and the enlightened' citizens of Patna experienced at the prospect of the apparent renewal of 'naxalites activities' at Ekwari quickly gave way to gratifying relief. The Ekwari killings were not an alarming event for them. For this time, it was not the landlords who were the targets of naxalites but the same poor farm labourers whose cause, the naxalites once claimed to be championing. Visibly relieved they had sipped additional cups of their morning beverage while discussing the latest killings by the 'naxalites'. Now that the 'naxalites' had shown their true colours the 'labour class' would realise that the naxalites were not sym-

pathetic to their cause and so would return to their old masters. This would mean that they (the landholding classes) would now have no problems in maintaining their landed estates in far away villages and can be assured of getting the same obeisance which was their birthright but which the labour class had stopped paying under the demonic influence of the naxalites. This would also mean that they can have as many 'naukars' in their homes in the cities as they want and the naukars will not indulge in acts of defiance and indiscipline. So went the discussions.

Coming as it did after almost 20 years, since Ekwari became known to the outside world, these killings should have occasioned some serious thought over why at all such killings were still taking place in an area where the government had spent massive sums at 'development' and 'restoration' and 'maintenance' of 'law and order' which had been 'rudely disturbed' by the 'naxalites' two decades back.

But let alone this, the killings did not generate even an iota of reaction. No newspapers bothered to publish even a follow-up or a backgrounder to the inci-

dent, while many of them did all they could to highlight that the naxalites had killed poor farm labourers and this was bound to rebound on them.

The lone exception was Jagannath Mishra who jumps on any opportunity that may bolster his efforts to dislodge the present dispensation ruling the state and thus to re-establish the lost empire of the upper caste landlords and bureaucrats over Bihar. Since the Ekwari killing has taken place at a time when the left parties were carrying a land liberation campaign, it provided the likes of Mishra another handle to denigrate the government and the land liberation movement. He had found the killing a direct fall-out of the 'atmosphere of chaos and violence' created by the chief minister's pronouncement that the police would not take deterrent action against those grabbing surplus lands of landlords as part of the campaign launched by 'leftist and extremist organisation'. Mishra immediately prepared a memorandum calling upon the governor to dismiss the government which had not only failed to maintain 'law' and 'order' but was also providing patronage to the land-grabbers. The Ekwari killings however had nothing to do with the ongoing land liberation movement of the left parties.

Since June this year, the Bihar Pradesh Kisan Sabha (BPKS), the peasant wing of the IPF, had been enforcing an economic blockade against about two dozen feudal landlords in the villages of Bhojpur. These landlords have achieved quite a notoriety for their brutality in exploiting the agricultural labourers. They are not only in possession of big landholdings running into several hundred acres but also by using the surpluses from agriculture and the manipulations through bureaucratic feudalism have acquired enormous non-landed assets and have diversified into businesses like transport, rice and flour mills and so on. Jwala Singh, the mukhia of Danwar Bihta who, according to popular belief, had masterminded the infamous Danwar Bihta massacre during the 1989 Lok Sabha elections, and later on, the mass rape happened to be one of the landlords against whom the BPKS had been trying to enforce an economic blockade. What the BPKS aimed to achieve through the economic blockade was forcing the landlords to capitulate before the peasant movement and give up their exploitative and oppressive tactics.

For imposing an economic blockade, the peasant movement call for a social boycott of the landlords and try to attack the economic resources of the landlords. An appeal is made to the agricultural labourers not to work on the fields of the

landlords. Similarly the village shopkeepers are requested not to supply commodities to the landlords. Ripe crops are harvested by the peasants' body. A fifth of the harvested crop is reportedly kept for the party fund and the rest is distributed among the needy people.

This strategy of economic blockade has registered significant successes. For instance on June 20 last year, one of the landlords Rajandhari Rai of Nonur village in Sahar block had surrendered before a BPKS rally, paid Rs 6,000 towards fine, vowed to pay enhanced wages to the labourers and treat them with dignity.

Sankh Singh of village Ekwari happened to be one of the landlords against whom BPKS had imposed an economic blockade. Since his assets and businesses are strewn in various parts of the district and state, he remained unaffected by the economic blockade. He was running a transport company which had a fleet of luxury buses, trucks and tractors. As part of their campaign against the landlords, the BPKS cadres had burnt down two luxury buses and one tractor belonging to Sankh Singh, since the latter had decided to run them in violation of the economic blockade called by the BPKS. Even this had not deterred the landlord and when the time came for transplanting the paddy crop, he had decided to get his land sown, come what may.

Since the agricultural labourers of Ekwari, in response to the appeal of BPKS, had decided not to work on the landlord's field, Sankh Singh had called labourers belonging to his fellow caste from another village, Baruhi and decided to sow his fields at gun point. He was one of the about 40 upper caste landlords in the village who held licensed arms. Besides the licensed weapons the landlords, as is normal in the villages of Bihar, held a number of unlicensed arms. So Sankh Singh had no problems in amassing weapons for use in the gohar against the peasant activists if they dared to resist the sowing of his field.

As the landlord started getting his field sown, activists of the local unit of CPI(ML) (Liberation) and its open peasant wing BPKS, warned the landlord to desist from it and firstly surrender before the people's court and atone for his past misdeeds. They also warned the labourers to desist from sowing work, violating the economic blockade imposed by the BPKS which amounted to going against the common wish of the village masses. The labourers however ignored these warnings.

So the CPI(ML) activists surrounded the field and fired in the air to scare away

the landlord and his men. Armed to the teeth, the landlord and his men opened fire on the CPI(ML) activists killing two of them. The CPI (ML) cadres retaliated killing four and injuring two others. And next day on August 14, the newspapers dutifully reported that the 'naxalites' have once again struck at Ekwari.

As is well known, it was at Ekwari and the neighbouring area that the now two-and-a-half decade old phase of the re-invigorated and revitalised peasant movement began and then grew to encompass the whole of central Bihar, broke new grounds across the Ganga and in the plateau regions of the state and is still gaining in strength and spread. In Ekwari and the surrounding area the movement achieved tremendous success in its fight against the exploitation and oppression of the weaker classes. Its strength grew and it achieved tremendous success in mobilising the toiling masses. Sections of all castes joined the movement though the overwhelming proportion was those of dalit agricultural labourers and poor peasants. This was natural, given the class-caste reality of rural Bihar.

But admittedly the movement could not achieve much success in mobilising the poorer sections of the upper castes as well as middle peasantry belonging to backward castes. The deep-rooted caste consciousness proved a big obstacle in developing class solidarity of the working masses. The Ekwari incident had an important lesson for the movement that despite the two-and-a-half decades of work among the rural masses, the caste consciousness of poorer sections of upper

castes remains a formidable obstacle and is an issue that requires to be devoted more thinking and efforts. The Amauli-Harinathchak killings however had all the elements of a class war but nevertheless had different set of lessons for the agrarian movement.

This killing had as its background a protracted movement waged by the Mazdoor Kisan Sangram Samiti (MKSS) to liberate a tract of 'gairmazarua-am' (public common) lands illegally occupied by a bhumihar landlord, Shyamnandan Singh, of the nearby Karwan village, around 50 km from the state capital and a demand for enhancement of wage rates. A rapacious landlord, Singh owns about 45 acres of land and is in illegal possession of several tracts of gairmazarua-am land.

Singh is a key figure of the Kisan Sangh, floated by the landed elements of the area. Originally a brainchild of the 'Shere-e-Bihar' of yore, Ramlakhan Singh Yadav who is now in JD(A), the Sangh has organised landed elements from all castes to crush the peasant movement. Since its inception the Sangh has committed a number of massacres and murders of peasant activists.

The peasantry of the area organised by the MKSS however has been agitating for freeing the gairmazarua land and for enhancing the wage rate. The landlord Singh however has been resisting the peasant's demands. When the labourers had refused to work on his fields, he had got his land cultivated by bringing farm labourers from outside. Upon this the MKSS had decided not to let the landlord harvest the crop. And thus on February 28-March 1, the peasants led by MKSS activists had harvested the gram crop from a five bigha plot occupied by Shyamnandan Singh and dumped the harvested crops in the neighbouring Sarvan-Musahari village.

Soon the landlord mobilised the Kisan Sangh hooligans. The *nouveau riche* yadavs of Amauli and Harinathchak belonging to Kisan Sangh ganged up. Armed to the teeth and helped by the local police, the yadavs raided the Sarvan Musahari village and retrieved the crops harvested by the MKSS cadres. On the same evening around dusk the MKSS cadres raided Amauli and Harinathchak villages and killed five people who had participated in the retrieval operation on behalf of the Kisan Sangh. All those killed were yadavs and the MKSS contingent also consisted preponderately of yadavs besides Musahars and other dalit castes.

This killing thus showed that the propertied classes from various castes are

shedding their traditional caste rivalry and joining hands to crush the popular movement of peasant labourers. After the killing the Bihar CM, Laloo Prasad, puzzled at the 'strange alliances' angrily asked a villager, Kameshwar Yadav, at Harinathchak, "Why did you go to the rescue of a bhumihar landlord who owns over 40 to 50 acres of land? After all you are a poor Yadav, and as such, you should not have gone to his rescue." At this Yadav instantly replied mincing no words that he did own five acres of land and was an 'active member' of the Kisan Sangh which the landed elements have formed "to protect (their) land and property from the Naxalites, and as the member of the organisation (they) decided to help Shyamnandan Singh who is also a member of the Sangh".

At the other end, the killing also showed that class consciousness among

backward castes has also taken roots. That yadavs organised by MKSS should have no hesitation in attacking yadav hooligans of Kisan Sangh once again highlights this. This also shows that the task of running over the middle peasantry is still confronting the movement. That five acre owning backward farmers should be aligning with 50 acres owning upper caste landlords shows that the middle peasantry is still lying in the vice-like grip of the landlords. Unless the movement succeeds in winning over the middle peasantry, the task of tilting the balance of class forces in the rural areas in its favour will remain unfinished. And this requires some serious thinking on the stand the movement has taken over the question of peasant-led transformation of agriculture which the movement so far appears to be still treating as reactionary lumpen transformation.

Drought in Kalahandi The Real Story

Jagadish Pradhan

The problems of Kalahandi are not unique—many other drought-prone areas of Orissa and the adjoining states suffer from more or less the same pattern of distress, which is rooted in the distorted development perspectives of the state.

KALAHANDI in the recent years has become synonymous with drought, starvation, poverty and all such maladies of the human world. Not surprisingly therefore, ever since the mid-80s 'Kalahandi' has been hitting the headlines in the regional as well as national newspapers and magazines. Between 1966 and 1988 three prime ministers have visited the district a number of times to assess the gravity of starvation deaths, child-selling and human beings surviving on mere grass and inedible roots, etc. Governments have been claiming that a number of special schemes, to change the situation in Kalahandi, have already been taken. Researchers and academicians have undertaken research on the various aspects of the drought in Kalahandi.

Is drought the real problem in Kalahandi? The shortage of rainfall has always been held to be the culprit. From Table 1 we see that during the period 1977 to 1988 the average annual rainfall in Kalahandi has been 1,254.9 mm, which is quite impressive. In seven years during this period the rainfall in Kalahandi has been more

than the average rainfall of Orissa. Only in five years has it been less than the state average. Further, those five years also cannot be called the drought years in Kalahandi. During the past 20 years, 1988 has recorded the lowest rainfall in the district around 978 mm. During 1990-91, Kalahandi had a rainfall of 2,247 mm, highest recorded in decades. Can we say then that deficit rainfall is the cause of drought (meteorological drought and agricultural drought...) which leads to poverty? The problems then must lie elsewhere.

Is the crop pattern responsible for the agricultural drought in Kalahandi? From the Tables 2 and 3 we find that 48 per cent of its area is under forests, among the highest in Orissa and constituting roughly 10.5 per cent of the forest area of Orissa. Of the cultivated 7,62,000 hectares, foodgrain is grown on 82 per cent of the area. Paddy, which requires more water than other crops, is grown only on 41.7 per cent of the cultivated area. Approximately 40 per cent of the cropped area is under drought-resistant and dry-land

crops like jowar, ragi and other millets are also grown along with pulses like mung and gram. There is also a feeling that, since the area under paddy crop has increased, drought has become more acute. So the figures say clearly that rainfall shortage has not been the cause. Moreover, government records show that in the past few years paddy cultivation has been declining in Kalahandi.

Agriculture scientists believe that Kalahandi, Koraput and adjoining parts of Chhatisgarh and Bastar in Madhya Pradesh have been the natural habitat or genetic home for a number of large varieties of rice. Rice cultivation is older here than in other parts of India. Recommending the introduction of hybrid rice and such other crops will only aggravate the problem. In fact by careful seed selection over the centuries farmers in Kalahandi, like subsistence farmers in many other regions, have developed an astonishing range of crops. This has provided them with adequate protection against monsoon—failures, pests, blights and so on. Sadly, the people who blame the traditional crop pattern of Kalahandi do not know that, by using the least amount of chemical fertilisers, pesticides or hybrid seeds, the farmers' per capita food production in Kalahandi is higher than that of Orissa and India.

There have of course been frequent crop failures in Kalahandi in the recent years, but they are neither due to meteorological nor agricultural drought. Economists, environmentalists and agriculture scientists will now have to coin a new terminology for this condition. The biggest irony however is that Kalahandi has been a food surplus district all this while despite the monumental crop failures.

During the year 1989-90 per capita food production of food in India was 203.13 kg and in Orissa it was 253.03 kg. In Kalahandi the same year, per capita food production was 331.86 kg which is much higher than the national average and about 30 per cent higher than the state average (Table 4). According to the final report by J Das on Land Revenue settlement in Kalahandi district (1946-56) "During the last twenty years there was no failure of crops (in Kalahandi) except in 1938-39, 1945-46, 1946-47 and partial failure in 1947-48. There was however sufficient reserve stock to meet the requirement of the people."

For the past decade or so intellectuals, planners, politicians and many outsiders have been using terms like 'deforestation', 'drought' and 'crop failure', etc, for the

poverty of Kalahandi. Now some have begun pointing their fingers towards maladies like unequal landholdings and landlessness, etc, for the poverty of the district. Some of the following statistics will reveal how landlessness is contributing to the poverty of Kalahandi:

- Per capita cropped area in Kalahandi is 0.592 hectare which is the highest in Orissa. The state average per capita cropped area is 0.332 hectare.
- Total number of landholdings against the population is the second highest in Kalahandi in Orissa. Bolangir tops the list with 15.71 per cent followed by Kalahandi at 15.39 per cent. This figure for Orissa is 12.62 per cent. This clearly shows that Kalahandi and Bolangir have the least problem of landlessness compared to other districts (Tables 5 and 6).
- Recent statistics put the percentage of landless agricultural labourers at 31.03 per cent of the total population which is not a very high figure compared with most parts of Orissa/India. Some sample survey by NGOs have shown that the percentage of landless in reality is less than the government figure of 31.03 per cent.
- Economic survey of 1954-55 indicates that 98.2 per cent of tribals were dependent on agriculture for their livelihood, 68.2 per cent were owner cultivators and only 2.4 per cent were tenants (P-243, ODG-1980). The tribals in Kalahandi have been less dependent on MFP (forest) than the tribals of Koraput, Phulbani, Ganjam and hence deforestation is not the major reason for their impoverishment as some believe.
- As per the statistics of 1981, the density of population per sq km in Kalahandi was 114. This figure for Orissa was 169 and the average density of population for India was 216. One may compare this figure with the DOP of West Bengal which is 615, Bihar 402, Assam 254 or the neighbouring state MP with 118.
- The decadal population growth in Kalahandi during 1901 to 1991 have been always less than the state or national growth. Between 1971 and 1981 the variation has been +15.06 whereas it was 20.17 for Orissa and 24.66 for India.

An article in *Sunday*, (January 24-30), mentions that 26,000 "large farming houses hold 1,70,000 hectares of land and citing this statistics a senior government official emphasises the 'lopsided distribution' of land as the problem for the poverty of Kalahandi. This is a misleading state-

ment since each of these 26,000 on an average own only 6,538 hectares of land and that too most of these lands are unirrigated. It is most unfortunate therefore that, while a large number of these 26,000 farmers are also reeling under poverty, they are branded as 'large farming households'."

In some of the better-off and more fertile districts of Orissa, the land distribution is even worse which can be seen from Table 7. So one cannot attribute lopsided distribution of land as a factor for poverty in Kalahandi.

In the land settlement of 1946-56 all the lands in Kalahandi had been classified into 20 different categories. Land having supplemental or protective irrigation facilities were put into the following categories: (1) Bahal Kharipani, (2) Berna Kharipani, (3) Mal Kharipani, (4) Bari Kharipani, (5) Bahal Pani, (6) Berna Pani (7) Mal Pani. These seven categories of

TABLE 2: LAND USE IN KALAHANDI DISTRICT

Total cropped area	5,73,000 ha, Total geographical area 11,58,000
Percentage of cropped area to total geographical area	49.48
Percentage of forest area to total geographical area	48.1 (1989-90)
Percentage of paddy crop area to total area (cropped)	41.71 (1986-87)
Percentage of cropped area irrigated	9.21 (1986-87)
Population	13,39,000 (1981)

lands used to get supplemental or protective irrigation from tanks, 'katas', 'sagar' (lake) and other sources which were previously owned by the ex-rulers or private cultivators. It is estimated that in Kalahandi district, at the time of independence such land (having protective irrigation) comprised about 48 per cent of the total cultivable area. However, after independence most of these irrigation sources are 'nationalised' and in the absence of maintenance most of them are no more in a condition to provide any irrigation. This is a major reason why the total irrigated area in Kalahandi, instead of increasing, has come down to 9.21 per cent of the total cropped area as in the year 1986-87.

The few irrigation projects that have been undertaken in Kalahandi district so far are mostly renovation or expansion of the age-old irrigation tanks formerly owned by the royal families or a few Gountias (ex-village heads) (Table 8).

The people who have controlled the politics of Kalahandi as 'people's representatives' all have irrigated lands even though for most of them agriculture is not the primary source of living. Since most of them have hardly any interest in agriculture, they have not shown any interest to develop irrigation systems in Kalahandi. If a politician has fought for the Indrawati project, it is with the ambition of setting up an industry rather than for development of agriculture. If they had loved agriculture, they would have fought for projects like Lower Sundar, Indra, Sandul, Udanti, etc, which would benefit the so-called chronically drought-prone areas and bring benefit to the local people. As in the flood-prone areas, unscrupulous politicians have exploited floods, drought and poverty to mobilise votes. Despite the high rainfall, amazingly high production of foodgrains, vast areas of good quality agricultural land, comparatively a lowly populated area and abundant natural resources, it is a fact that a vast number of the people of Kalahandi have been reeling under acute poverty. To understand the causes of poverty in Kalahandi (and many other areas similar to Kalahandi) one may look at the following four phenomena which are all inter-linked.

Phenomenon-I: There is no mechanism for compensating occasional crop loss. In indebtedness of farmers increases due to (a) Inadequate investment for subsequent cropping, (b) Maintenance of land is ignored—(i) Further reduction in output, (ii) Indebtedness increases, (iii) Unemployment of agricultural labourers increases, and (iv) land transfer to non-agriculturists

and non-subsistent farmers increase. One hectare of land in Kalahandi having protective irrigation has employment potential for about 280 person days per year whereas in distressed cultivation the same land is cultivated with an employment of about 80 person days per year.

Phenomenon-II: (a) Traditional sources of irrigation (tank, pond, kata, well, etc) are neglected and (b) Depletion of forest—particularly the village and 'patra' forest. Area with protective irrigation has got reduced and crop loss results in poverty.

TABLE 3: AREA OPERATED BY SIZE, CLASS OF OPERATIONAL HOLDING (1985-86)

	Number	Area	Per Cent of Total Area	Per Cent of Total Holdings
Below 1 ha	76,900	43,700	9.91	35.70
1 to 2 ha	60,900	83,000	18.83	28.13
2 to 4 ha	51,000	1,34,000	30.40	23.67

** Orissa Agricultural Statistics 1989-90, director of Agriculture and Food Production, Orissa, p 29 to p 33, Table 20

For the above computation population of India is taken as 840 million and the population of Orissa and Kalahandi are taken as 31.51 million and 1.592 million respectively. These figures are the Provisional Census figures for 1991. Against the population of 1990 the per capita production of foodgrain would have been slightly higher for all the above categories.

It is assumed that each landholding is owned by one household, the number of landless in Kalahandi will be 26.42 per cent of the total population.

Phenomenon-III: (a) Depletion of cottage industries (weaving, paddy dehusking, oil extraction, etc) and (b) Depletion of forest—(i) Employment in off-farm activities has gone down, (ii) Fodder deficit for cattle has an adverse effect on crop production, (iii) Increasing migration, and (iv) Depletion of forest causing drying up of streams and has effected winter cropping which used to compensate for occasional monsoon crop losses.

Phenomenon-IV: Increased yield in the command area of Hirakud Dam has meant that paddy growers in rainfed areas face stiff competition from paddy growers in irrigated areas. This has also ruined the economic condition of farmers in non-irrigated areas of Sambalpur, Bolangir and Sundergarh districts. There has been a fall in the purchasing power of local people, a fall in the demand for paddy from Kalahandi and non-remunerative prices for paddy from Kalahandi outside and in Kalahandi. Supply of foodgrain relief from outside has discouraged growth of local food production, further reducing the demand of local food produce. The government support prices for paddy is not remunerative for the farmers in rainfed areas. In 1982-83 the support prices for paddy (common/per quintal) was Rs 122 which was not adequate at all. During the period 1982-1992 the cost of production has gone up by four to five times and hence in 1992 the support price of paddy should be at least Rs 450 per quintal. But the government has fixed it at Rs 280. Moreover during November 1991-January 1992 in Kalahandi (also in many other pockets of Orissa) the actual price of paddy was between Rs 180 and Rs 220 per quintal. This has been pauperising the farmers and leading the entire population into the grip of poverty. The traders and moneylenders in Kalahandi—who also control the political power and the bureaucracy, have been flourishing while the local farmers are sinking in poverty.

Is there a solution? The problem of Kalahandi is primarily due to the negligence of agriculture and the farming sector and not due to the deficit in rainfall or any natural disaster. The problems are totally government-created. The Indravati Project which is under construction will worsen the condition of the people of non-irrigated areas in Kalahandi, Koraput, Bolangir and Sambalpur districts. The following are some recommendations to improve conditions:

(1) *Agriculture Development and Watershed Development Approach:* The

traditional irrigation system in Kalahandi has always been based on micro-watershed development. So the extension of the micro-watershed development could bring a revolutionary change in Kalahandi. Because of the typical landscape of Kalahandi, most of the villages form a number of micro-watersheds and there is therefore a tremendous potential for their development which could provide protective irrigation during the kharif and winter harvest seasons. In fact the farmers have been developing the micro-watersheds quite scientifically, which has been discontinued after government interventions. Impoverishment of the farmers in the post-independence period has also been another reason. A rough estimate shows that to develop the micro-watersheds in the non-irrigated areas of Kalahandi to provide protective irrigation to about 80 per cent of the cultivable land in the district, an amount of Rs 5,000 million will be required which is about half the cost of the Indravati Irrigation Project. This can be spent over a period of 10 years. This will also create additional employment for 3,00,000 people every year. Food production can be multiplied by four to five times and the returns will be enormous.

This will also pave the way for development of industries, trade and commerce in the district. Kalahandi alone has the potential of producing an extra one million tonne of foodgrains, if the micro-watersheds are properly developed.

(2) *Stop medium/major irrigation projects pipeline:* These projects will only increase regional disparity and adversely affect the people.

TABLE 6: LANDHOLDINGS AND PERCENTAGE OF LAND OWNED BY DIFFERENT CATEGORIES OF HOLDINGS IN DIFFERENT DISTRICTS OF ORISSA, 1980-81

Bandamunda MIP**	Additional benefit is negligible
Ashasagar MIP**	Government agricultural farm only

* During state rule there was a diversion which was made pucca after independence.

** It is improvement of an existing 'kata'.

distribution needs to be stopped. The government has to ensure fair price to all agricultural produces by strengthening the marketing network.

(4) *Support services for the farmers to be built-up and strengthened:* There has been no cold storage and other infrastructures in the district for which onions, potatoes and other vegetables and fruits of the district are procured by the traders at throw away prices and exported to Raipur to be imported later for sale at high prices in Kalahandi. The nexus between politicians, traders and the bureaucracy has to be destroyed. This entails a long-term process of political and social education of the people for this alone holds the key to development in the district. Without this, no development programme will have any impact on the district.

The policies of the state and national governments as well as the policies at the

global level have been directly affecting the common man living in any part of the earth. The recent changes in our government policies is going to have a tremendous impact on the life of the common people. This is likely to encourage stronger regional competition for 'survival'. So, unless the people in Kalahandi are helped to be alert and active in advance, they may get pushed further down.

The problems of Kalahandi are not unique. Many other so-called drought-prone areas of Orissa and adjoining Madhya Pradesh and Bihar have more or less the same type of problems. Fortunately, there has been a growing consciousness among the common people of Kalahandi in recent times and a number of formal and informal groups have come up to address to the issues of Kalahandi. In the administration also, there are more people now who are willing to delve deeper into the issues of Kalahandi.

A member of a women's group in Baroda gives me a similar example of a woman whom she interviewed last year. The side-effects were too much, but it was only after repeated visits to the hospital that the implant was finally removed. In this instance, she was not only made to run around by the hospital staff, but was also pressurised to retain the implant by her brother-in-law who was a hospital employee.

Both activists have reported that hospital authorities refuse to divulge the names of Norplant acceptors, making it next to impossible to monitor the programme. And it was only because of their broader community level work that they were able to identify a few women who had received Norplant. Nurses who are themselves on Norplant are tight-lipped and refuse to discuss their experiences. One cannot even be sure, therefore, if they are truly willing acceptors. The secrecy shrouding the programme makes its human rights dimension highly suspect.

The above are not two stray instances. They are examples reflecting what is going on in other third world countries where Norplant programmes have been introduced.

Studies in Family Planning (Volume 21, No 2, March-April 1990) has a report assessing 'acceptability' of Norplant in the Dominican Republic, Egypt, Indonesia and Thailand. The gist of it is that in all four countries there were reports that removal on demand did not occur to the 'satisfaction of the user'. In Thailand doctors insist that users should continue the method because it is costly. Thai women getting Norplant are routinely told that because it is a long-term spacing method, it will not be removed for 'minor side-effects'.

The report states somewhat mildly, that service providers need to distinguish between helping a woman cope with side-effects and coercing her to continue a method she has decided against. And adds that such coercion is equivalent to 'usurpation of a patient's right to removal on demand'.

In India much of the controversy over Norplant has got bogged down in a nit-picking argument over its safety. The point is that even a 'safe' drug can be used to violate human rights in a coercive population control programme. State terrorism can take unexpected forms, and Norplant is neither merely a feminist issue, nor is it merely a health issue. It needs also to be included on the agenda of those campaigning for the protection of human rights.

Fix it, Forget it: Norplant and Human Rights

Vimal Balasubrahmanyam

In India much of the controversy over Norplant has got bogged down in a nit-picking argument over its safety. The point is that even a 'safe' drug can be used to violate human rights in a coercive population control programme.

MUCH has been written on the risks of introducing long-acting hormonal contraceptives in third world countries. The arguments include: doubts over long-term safety; unacceptable side-effects, particularly chaotic menstrual bleeding; women being urged to accept these methods without being told what side-effects to expect; and women being experimented upon with new drugs without informed consent.

The above arguments are all valid in the current campaign in India against introducing Norplant, a hormonal implant which, once fixed, is expected to give contraceptive protection for five years.

In addition, there is a possibility of violation of human rights in the Norplant programme which did not exist in mass distribution of pills and in mass experimentation with injectables. Women on pills or injectables can simply discontinue these methods if they cannot endure the side-effects. By throwing away the pills or refusing to turn up for the next injection. Not so with Norplant.

Undoubtedly it was the need to 'fix' potential drop-outs that led to the development of an implant. An ideal fix-it, forget-it method, guaranteed to satisfy not the user but the service-provider. Of course, 'removal on request' is a provision duly included, but for all practical purposes it remains a paper promise.

A health activist in Baroda gives me the example of a woman who received Norplant during Phase II trials of the drug in the 80s. Because of constant bleeding she was being physically abused by her husband for denying sex, and by her mother-in-law for not being able to work in the kitchen. Each time she went to the hospital and asked for removal she was put off with an excuse: The bleeding will stop; it is nothing to worry about; the doctor is not here today; put up with it a little longer; next time we will see; etc. Eventually, after about eight visits stretching over several months, the implant was removed when the woman threatened to commit suicide.

Patenting Gene Fragments

Arun Agrawal

In the US, the National Institute of Health's attempt to patent partial cDNA sequences corresponding to gene fragments in human brain tissue has sparked off a controversy which impinges on ethical issues and is critical to the evolution of the patent law on human interventions in naturally occurring substances.

TECHNOLOGICAL developments and changing concepts of property shape struggles over ownership. At one level, the emergence of patents, trade secrets, copyrights, trademarks and mask works¹ constitute simply a recognition of rights in intellectual property—a reward to innovation. At quite another, patents and similar legally enforceable property rights are another step in what seems the inexorable march of commodification. One can interpret in either manner the latest controversy over intellectual property rights, the attempt by the National Institutes of Health (NIH) in the US to patent nearly 3,000 partial cDNA sequences corresponding to gene fragments (also called 'expressed sequence tags' or ESTs)² in the human brain tissue.³ Significant ethical issues are involved. At what point do the results of human interventions in naturally occurring substances become patentable? At what point does life itself become patentable?

The US is arguably the world leader in biotechnology research. Not only is it the leader, it also remains the one world power that has exhibited the greatest willingness to flex its economic muscle in the cause of stricter worldwide intellectual property regimes.⁴ For a country like India, any major development in the US patent law regarding biotechnology signals a potentially profound impact. Precedents about what can be patented will in the long run influence hundreds of millions of households in all developing countries.⁵ The current controversy may influence the development of crucial drugs for cancer, AIDS and cardio-vascular diseases. At the same time, although the interests of developing countries are vitally at stake, we have little say in the developments in this field because we participate only to a limited extent in biotechnological research that uses the latest techniques.

The current controversy possesses four aspects that merit attention. First, what is the relationship of the controversy to product development and commercial applications of scientific discoveries? Patents are usually seen to promote new product development. But patenting each step in

the process of discovery of a useful invention may lead to excessive licensing fees. The cumulation of rents as each step of the process is patented, in effect, increases the fixed costs of 'supplying' new, commercially valuable research and products. Thereby it deters commercial advancement of a new discovery. Second, what problems does this dispute in the existing patent law in the US? A final decision in this dispute will be critical to the evolution of the patent law. The dispute calls into question a basic issue in patenting—whether patents can be sought purely on the basis of knowledge about the structure of a substance, rather than on the basis of knowing its function. Indeed, other criteria which are used to determine whether a patent is warranted—non-obviousness and novelty—are also being questioned. Third, how will a decision in this case affect communication and exchange of information among scientists? If scientific discoveries begin to be patented, free exchange of information and subsequently innovation are bound to suffer. And finally, what does this controversy bode for the interests of developing countries?

Although the controversy is far from being resolved, the most recent chapter in the story came to an end when the Patents and Trademarks Office (PTO) of the US rejected the patent claims of NIH in August this year.⁶ The beginnings of the story can be traced back to 1980 (Table I). That year, in *Diamond v Chakrabarty*, the US Supreme Court ruled that genetically engineered micro-organisms can be patented,⁷ overriding the initial patent office determination that living organisms cannot be patented. The 1980 ruling boosted the US biotechnology industry enormously. In 1988, the PTO awarded Harvard University a patent for a strain of mice which were highly susceptible to cancer. The susceptibility to cancer had been produced using genetic engineering techniques. Both of these decisions, deemed to facilitate product development and commercialisation of biotechnology, provoked enormous criticism on ethical grounds. Many commentators argued that

it is unethical to patent gene sequences since these are part of the universal natural heritage of humanity. The NIH patent applications last year for more than 2,750 partial cDNA sequences isolated in Craig Venter's laboratory touch on similar and equally fundamental issues. While the applications predictably triggered complaints about the detrimental effects on scientific research and communication,⁸ this time even those who believe in the necessity of patents for product development are divided on the issue.

According to NIH, there is little cause for either confusion or concern. It has claimed that its application made policy discussion on the issue possible, without any single individual securing the right to apply for the patents. This public spirited explanation, however, does not hold water. The NIH action has drawn tremendous criticism. The PTO has rejected the application. The Bush administration has expressed its lack of sympathy for the applications. But the NIH director, Bernadine Healy, is publicly committed to pursuing the applications further. Three other factors may be cited in the support of NIH. Since 1986, the US government has encouraged patenting inventions that result from federally funded research. The government believes that exclusive licences on patents will encourage private investors to commercially exploit new discoveries. The NIH is, therefore, only following federal policy. Second, if Venter had published his results, it would later have become difficult to patent useful proteins that were based on the sequences that he had derived. Difficulties in patenting would arise especially if his work made the subsequent discovery 'obvious'.⁹ NIH's insistence to patent thus demonstrates its desire to guard against an uncertain future where because of the diffusion of knowledge into the public domain it would become difficult to gain exclusive rights over new products. Finally, if the NIH did not file for patents, the option to apply would pass on to Venter who, in the meantime, has left the NIH.

It may seem then that the NIH had some justification in pursuing patents for the cDNA sequences that Venter identified. However, such a conclusion can be made only if it is indeed the case that patenting the sequences would promote product development. How can that be decided? Statements from the biotechnology industry in the US provide one indicator. A majority of the companies have indicated that the cDNA patents, if granted to the NIH, would actually hurt the industry. The Industrial Biotechnology Association in the US¹⁰ passed a

unanimous resolution in June 1992 that the NIH should pursue patent applications on genes only when the complete coding region (rather than fragments) and its biological function are known. The Association of Biotechnology Companies (ABC) supported the NIH decision to file for patents but qualified its support by suggesting the NIH should grant non-exclusive licences on the patents it receives. Such licences will possibly provide the NIH some return on its investment in genome research. But if the NIH grants non-exclusive licences, the cause of product development will surely be ill-served. Since the stated objective of the NIH is not to seek financial returns but to promote product development, the support from the ABC is ambiguous at best, because the ABC does not believe that the strategy followed by the NIH will fulfil the stated objective of encouraging product development in biotechnology companies.¹¹ The third major association in which biotechnology companies are members, the Pharmaceutical Manufacturers Association, also opposes the patenting of genes whose function is not known, since it "would inevitably impede the research and development of new medicines in this country (the US)".¹² It is remarkable that the biotechnology industry should feel this way because, quite demonstrably, the success of the industry depends on as strict a patent regime as possible regarding commercialisable products.¹³

The adverse reaction of the biotechnology industry forms one indicator of the desirability of the NIH applications. We can also investigate the impact of the NIH action on product development analytically. Whether NIH patents will promote the commercial development of products depends on the kind of patents it secures. The NIH application seeks patents for the cDNA that have been isolated and the genes or longer sequences of which they form part. But at present, even Venter has no idea about the function(s) that the cDNAs and associated proteins may perform.¹⁴

In *Brenner v Manson*¹⁵ the US Supreme Court held that nothing could be patented that did not possess a use apart from being an object of scientific inquiry.¹⁶ Patenting, in other words, requires that the material or process to be patented possess 'substantial' utility, and that it be of "specific benefit in currently available form".¹⁷ The NIH has attempted to get around this objection by identifying relatively trivial uses for its sequences: it argues, for example, that they can be used as genetic markers, or as

probes in identifying new genes. Since the US law grants patents for all possible uses of a patented invention or material, if the NIH receives the patents it will benefit not just from the uses it has identified for the isolated cDNAs but for all possible uses for all the sequences of which its cDNAs form a part. The real purpose of the NIH, one feels compelled to conclude, seems to be to "control individual DNAs and thereby commerce in the proteins they encode."¹⁸

This attempt by the NIH to control future developments in gene identification and to benefit from the efforts of later innovators goes quite beyond the provisions of the US Technology Transfer Act of 1986. More importantly, perhaps, it reveals substantial deficiencies in the US patent law which some have, ironically, called the most 'progressive' patent system in the world. It is because of these short-

comings in the law that Venter can file for patents on 'inventions' that are churned out by the computer at the rate of a thousand a month.

The deficiency in the current US law regarding the issue of utility stems from the historical development of the patent law. The system of patents was created to provide an exclusive but finite control over inventions that had a practical use so that the inventor would have incentives to sink time, finances and effort into a new idea that may finally turn out not to have any practical implication. The patent system is thus designed to distinguish between 'pure research', where the discoveries and findings should remain in the public domain, and applied technological research which is more closely related to the marketplace. In biotechnology, however, it is exceedingly difficult to differentiate between pure and applied research. With

TABLE: IMPORTANT STEPS IN THE COMMERCIALISATION OF BIOTECHNOLOGY

Year	Significant Events
1971	First gene cloned
1975	First hybridoma created.
1976	First firm to exploit rDNA technology founded in the US (Genentech). Genetic Manipulation Advisory group started in the UK.
1980	Diamond v Chakrabarty, US Supreme Court rules that micro-organisms can be patented. Cohen/Boyer patent issued on technique for rDNA. Spinks' Report in UK, Biotechnology targeted for Research and Development. FRG targets biotechnology for R&D. Initial public offering by Genentech—sets record for fastest price increase (\$35 to \$89 in 20 mins).
1981	First Monoclonal Antibody (MAB) diagnostic kits approved for use in the US. Japan targets Biotechnology Over 80 new biotechnology firms formed in the US.
1982	First rDNA animal vaccine approved for use in Europe. First rDNA drug for human use (insulin) approved in US and UK.
1983	First expression of a plant gene in a plant of different species.
1985	Advanced Genetic Sciences Inc receives first experimental use permit issued by EPA for controlled environmental release of a genetically altered organism.
1986	Technology Transfer Act of the US—allows for patenting of federally-sponsored research.
1987	The US Patents and Trademarks Office announces that non-human animals are patentable.
1988	NIH establishes programme to map the human gene. First US Patent issued on animals—a transgenic mouse engineered to contain cancer genes.
1989	Court in FRG stops construction of a test plant to produce genetically engineered insulin. Bioremediation gains attention as microbe-enhanced fertiliser used to battle Exxon Valdez oil spill.
1990	First bio-engineered food additive approved by the US FDA on Renin, enzyme used to make cheese. FRG enacts Gene Law to govern use of biotechnology. Human gene therapy clinical trials approved.
1991	Biotechnology companies sell \$17.7 billion in new stock. The US EPA approves the first genetically-engineered biopesticide for sale.

the possibility that each new discovery or advance in the academic's laboratory may lead to future commercial applications, the boundaries are becoming increasingly blurred.

Thus, although it may in the past have seemed inconceivable that anyone would go to the trouble of inventing something that did not have utility, and further, would want to patent such 'useless' inventions, the manner in which developments take place today in biotechnology means that there is a significant possibility of new uses being discovered for materials that have simply been identified. The observable consequence of this prospect is that patent applications are generated on every step of the way from the initial discovery to the possible final marketplace application. The NIH application reflects this phenomenon. It seeks to control the undiscovered uses of the proteins encoded in human genes rather than merely the uses for the cDNAs noted in its application. Here an analogy is illustrative. The NIH attempt has been compared to someone claiming huge plots of land on the possibility that there may be gold underneath. As Robert Merges, professor of law at Boston University notes, mining laws in the US protect against this kind of action. There are limits to what can be claimed, the land must be worked for the rights to mature, and according to him, a similar law is needed in the context of the cDNA patents.

The debate on the NIH patent applications is indisputably intricate on grounds of utility and with respect to the ethics of monopolising the humane genome. On technical/legal grounds of novelty and non-obviousness, the applications are even more problematic.¹⁹ Novelty means that an invention should not have existed in the public domain prior to the filing of a patent. Non-obviousness means that a person of 'ordinary skill' should not have been able to come up with the claimed invention using existing knowledge and techniques. The NIH cDNA sequences have been derived using conventional techniques to cDNAs available from a commercial cDNA library. And while the gene fragments may in the future turn out to possess unexpected properties, the characteristics identified in the patent applications, at least, are entirely predictable ones.²⁰

If the NIH is ultimately granted the patents, this would open the field to all laboratories and researchers who have access to the widely-known technology used by the NIH to derive the partial cDNA sequences. Venter alone has received \$70 million to continue his work on an even larger scale at the privately funded new

organisation 'Institute for Genomic Research' that he has joined. The Institute has been founded to commercialise genome research.²¹ It will initially focus on sequencing cDNA, the one area of genome research that most analysts agree possesses relatively short-term commercial potential.²²

MARKET POTENTIAL

The human genome has some 1,00,000 genes. If we consider Venter's vow to identify 2,000 genes every week, he is clearly in a position to patent the entire human genome in short order. Wallace Steinberg, the financial backer of the Institute of Genomic Research, believes that as many as 20,000 of the genes could provide lead for drug development.²³ Even if only a few of the genes express medically useful proteins, the persons who can patent partial cDNA sequences for them would be sitting very pretty. The long-term commercial potential has not been lost on other investors on Wall Street. Frederic Bourke, a wealthy entrepreneur, intends to start a sequencing company with an investment of \$50-60 millions. Other investors are maintaining careful watch (e.g. the Maryland-based Genetic Therapy Inc).²⁴ The interest of Wall Street is not misplaced. Several block-buster drugs have been developed employing biotechniques and enormous profits from new bio-drugs are a distinct possibility.²⁵ However, if patents are granted on discoveries that have no obvious current utility, not only may future product development become more uncertain, new investment may also be deterred.

The current controversy over patenting cDNA becomes all the more significant since many of the bio-drugs that are finally developed will use DNA or messenger RNA. The international patent regime that will greet the products of biotechnology companies as the products are sold in global markets will determine who benefits, in what manner, and to what extent. If the PTO begins to grant patents on the basis of the structure of the cDNAs alone, it seems obvious that a very small number of individuals will gain a Full Nelson on the human genome. It seems equally obvious therefore that when patents are granted for particular substances, only the known uses of these substances should be patentable—not all possible uses including those that have not been discovered.²⁶

In short, only slim grounds exist for granting patents to the NIH on the cDNAs it has claimed. In light of this, the initial ruling by the PTO to reject the NIH patent applications is heartening. The ap-

plications were rejected on all the three grounds of utility, novelty and non-obviousness. The sequences lacked obvious utility since their value as probes was not clear; they lacked novelty since they were derived from a publicly available collection; and they lacked obviousness since many of the base sequences of the fragments had already been published in the literature.²⁷ But at the same time, the NIH director, Bernadine Healy, has asserted that the NIH had anticipated the response of the PTO all along, that such rejections are routine at the first stage of an application, and that the NIH is going to revise and file new applications soon.

The dispute, as it unfolds at the level of the major participants in the debate seems to shed little light on how it can be resolved. Even the courts, should the matter be referred to them in the course of time (as it undoubtedly will be), have few legal guidelines in the matter. What is available as guideline is case law. But it makes little sense to rely only on court decisions made in the past for future developments since the past is so inadequate a guide in this rapidly evolving field. New legislative remedies must be provided, and they must take into account the fact that just a few researchers can use partial cDNA sequences to patent the entire human genome in a matter of years using fairly limited resources. The same techniques used for sequencing the human DNA can also be used for other organisms that seem to possess commercially potential—providing a means to gain patent rights on these other organisms too. It makes neither economic, nor ethical, nor political sense then, to effectively grant a few individuals monopoly rights over all possible drugs developed using DNA from living organisms.

Because this case holds enormous ethical, political and commercial portent, it is regrettable that the US has refused to see any need for new legislative or policy guidelines in the matter. D Allan Bromley, the science advisor to George Bush, believes that there exists no need for a policy initiative since the PTO will not approve the NIH application. He has also rejected the need for any international treaty on the subject since such a treaty would be like 'using an elephant gun to kill a butterfly'.²⁸ What Bromley does not anticipate is that in the absence of a policy, controversies similar to the NIH applications can also be guaranteed in the future.

On this issue (as of course on many others), the stand taken by the Bush administration in the US White House seems confounding. One of the primary reasons cited by the NIH to defend its actions is

the US government policy of encouraging patenting of research results. But if the US government is against the patenting of partial gene sequences, a clear statement to the effect would clear much confusion and prevent international ill will. By expressing the hope that the patent claims will be rejected, while at the same time rejecting the need for any clear or consistent policy, the US government is sending mixed signals not just to the NIH but to all researchers in the field, and to the PTO itself. The government, in effect, seems to be saying that case-by-case decision-making is the optimal policy in highly controversial situations since it is difficult to reach agreement on the principles involved. This, however, is an invitation to 'muddle through', evidently the policy option universally preferred by bureaucracies and politicians. It avoids unpopular stances and uses a logic of justification to rationalise decisions that in the long run often prove harmful.²⁹

The pernicious effects of the NIH action on international genome research are already being felt. The Medical Research Council in Britain has followed the action of NIH and has decided to keep its genome database to itself.³⁰ David Galas, the director of the US department of energy, has warned that pursuing patents of partial gene sequences is likely to lead to further disputes, "inhibit real innovation", and create patents that are "all but useless". Axel Kahn, the research director of the French Science Agency INSERM, has expressed firm French opposition to patents on partial sequences and has accused the NIH of exaggerating the risks of not patenting.³¹ Indeed, most European governments have deplored the NIH policy. At the same time, France, England and Japan have sought an international treaty to prevent patenting of substances whose function remains unknown. Patent rights over a discovery have not yet incited situations where those using the discoveries for further academic research are sued by the patentholders. But if patents begin to be granted for substances and processes whose functions are barely known, suing those who use a patented discovery for scientific research would become a very real possibility. The adverse impact of such a situation on new research and innovation can be readily imagined.

The final decision on this case will critically influence issues of free scientific exchange in research, product development and safeguarding inventor's rights, patenting of substances on the basis of structure rather than function, and requirements on patent applications regarding the utility of the invention, its novelty and its obviousness. For these larger

reasons the case is significant. But for the specific issues concerning sequencing and mapping of the human genome,³² the case may prove to be less significant because the knowledge about the human genome may be soon available in the public domain.³³ The Human Genome Project, an international collaborative research project, is also sequencing and mapping the entire human genome using a structural approach to begin with. Once the structure of the human DNA has been identified, research on identifying the functions can proceed. It is interesting to note, therefore, that when the genome project was established, both the Office of Technology Assessment, and the National Research Council in the United States decided not to patent gene sequences. Two of the 24 human chromosomes have already been fully mapped by the Human Genome Project. In view of the vast amount of information that the project is going to uncover, it is reassuring at least from the point of view of developing countries that many of the researchers involved with the Human Genome Project believe that the Genome databases they create should be open to anyone with any interest for any reason.³⁴ Others criticise the approach of scientists like Venter whose "primary concern (is) chipping off profitable pieces of the genome".³⁵ Many

of the Genome Project scientists argue that the idea is to decode information that is valuable to the entire human species. If these researchers have their way much of the knowledge represented by the cDNAs, and relatedly, their commercial potential may pass into public domain. Fittingly, it would be quite independent of the final outcome of the NIH case.

For developing countries, the current case promises to set precedents that will significantly affect future developments in new technologies. There is a large class of diseases that may prove amenable to treatment by drugs developed using bio-technologies. The natural immune system is relatively ineffective in coping with some organisms that can either shuffle the genes of their surface proteins, or may be too large or complex for traditional methods of medicine to yield answers.³⁶ It may be only through the use of highly advanced technologies that any solutions to such diseases become available. Similarly, gene technologies are beginning to provide important tools in diagnostics as well as therapeutics. Further, many of the human diseases are of genetic origin. The Human Genome Project will therefore, in time, provide a picture of genetic pathology that will prove invaluable in identifying the presence of genetic factors that predispose individuals to certain kinds of diseases. A

Shivaji & His Times

Jadunath Sarkar

Shivaji & His Times is a comprehensive account of the life and times of one of Maharashtra's greatest heroes. After a brief introduction to the geography of Maharashtra, and a description of the people of that land, the book traces the rise of Shahji Bhonsle, Shivaji's father in the service of the Adil Shah of Bijapur. Shivaji's boyhood, his early victories and his wars with the Mughals and the Adil Shah, are recounted in detail. A major portion of the book is devoted to Shivaji's relations with the Mughal Emperor Aurangzib, and his constant struggle to capture the Maratha territory. Shivaji's coronation, his subsequent forays into southern India, his efforts to build a strong navy, his relations with foreign powers are all discussed in the book.

The author also makes a critical assessment of Shivaji's contributions and achievements, and his place in history using a wide range of sources and historical documents in a variety of languages, the author draws a definitive portrait of the great Maratha ruler and nation.

conclusion of the cDNA patent applications in favour of the NIH will make it that much more difficult for the developing countries to gain the benefits of new technologies and possibly the benefits from the Human Genome Project. Finally, a decision favouring the NIH may also close off for us future options for researching the human DNA that we may wish to keep open.

The final decision in this case will also affect other genome projects. Computer technology continues to register phenomenal advances in storing data and processing information. Electronic chips capable of storing gigabytes of data will be used commercially in less than 10 years. Matching processing speeds for data retrieval and processing are equally imminent. As computer technology makes gene sequencing and mapping more cost-effective, there will be genome projects for other living organisms that possess commercial value.³⁷ The United States department of agriculture (USDA) has already initiated a plant genome project and is planning an animal genome project with the object of obtaining genome maps for all major crop species important to the US. (These include corn, tomato, rice and soybean. Animal species such as swine and cows are included). Genome projects are also under way in the European Community and Japan. Gene maps and sequences obtained from the genome projects will be used to manipulate genes in crop and animal species that code for desirable traits such as hybrid vigour, disease resistance, drought resistance, resistance to temperature variations and to cold, salt tolerance, better taste, and production of specific substances.³⁸ Since it is now possible to accomplish cross-species gene splicing using rDNA techniques, the above wish list is not as far-fetched as it may seem.

Ignoring technological and legal developments that take place in the US and other western nations will prove not just a short-sighted policy. It is also detrimental to the interests of the developing countries in the immediate run. We must attempt to gain a share in emerging technological developments, create indigenous research capacity and match our legal provisions to changes taking place in the west, especially changes in the US. The only other option is to foreclose future options.

Notes

Marx after Marxism

A Subaltern Historian's Perspective

Dipesh Chakrabarty

The old certitudes which once made Marxists feel like they belonged to one international tribe have to be rethought. But this rethinking has to issue from our own positions as intellectuals who think out of a real or imaginary base in India, and its tasks cannot be deduced from contemporary European and Anglo-American theory in any formulaic manner. An attempt at outlining a possible approach to this question.

AT the outset I should make it clear that my remarks do not in any way implicate the *Subaltern Studies* collective. What follows are my own reflections on some current problems of Marxist historiography as they appear to me, and they arise from an interest in writing histories of subaltern classes and of the phenomena of subordination and domination in general. But they also arise at a particular time when Marxism is being seriously questioned in avant-garde western theorising. Since to be a Marxist is to work within European traditions of thought anyway, one can ignore the challenge of what generally pass under names like 'post-structuralism' or 'deconstruction' only at one's peril. The old certitudes that once made Marxists feel like they belonged to one international tribe have to be rethought. (This at any rate is one of the assumptions on which this short intervention is based.) But this rethinking has to issue from our own positions as intellectuals who think out of a real or imaginary base in India, and its tasks cannot be deduced from contemporary European and Anglo-American theory in any formulaic manner. What follows is an attempt at outlining a possible approach to this question.

Many readers will recall that *Subaltern Studies* began as an argument within Indian Marxism and in particular against the teleologies that colonialist and nationalist-Marxist narratives had promoted in the 1970s in the field of Indian history. Initially, we wanted to oppose the methodological elitism of both varieties, but our aim was also to produce 'better' Marxist histories. It soon had become clear, however, as our research progressed, that a critique of this nature could hardly afford to ignore the problem of universalism/Eurocentrism that was inherent in

Marxist (or for that matter liberal) thought itself. This realisation made us receptive to the critiques of Marxist historicism—in particular to the message advocating an attitude of 'incredulity toward grand narratives'—that French post-structuralist thinkers increasingly made popular in the English-language academic world in the 80s. But there have always remained important and crucial differences. Unlike in the Paris of the post-structuralists, there was never any question in Delhi, Calcutta or Madras of a wholesale rejection of Marx's thought. Foucault's scathing remark in *The Order of Things* that "Marxism exists in nineteenth-century thought as a fish in water, that is, it is unable to breathe anywhere else", may have its point (however exaggerated) but it never resonated with us with anything like the energy that anti-Marxism displays in the writings of some post-modernists.

This was so not because we believed in any Habermasian project of retrieving Enlightenment reason from the clutches of an all-consuming instrumental rationality. Our attachment to Marx's thought has different roots. They go back to the question of European imperialism from which the problem of Indian modernity cannot be separated. (The question of colonial modernity, or I might say the question of colonialism itself, remains an absent problem in much post-structuralist/post-modern writing.) However, for a modern Indian intellectual—that is, someone who engages in serious commerce with the thought-products of the European Enlightenment and with their inheritances and legacies but someone who is also aware, from the cultural practices of Indian society, of there always being other possibilities of 'worlding' that now exist in uneven and often subordinate relationship

to 'Western metaphysics' (forgive this summary expression)—it is difficult to trash Marx's thought quite in the manner of a Foucault. Again, not because it is difficult to sympathise with the intellectual criticisms of historicism. (I will in fact go on to argue here that these criticisms have to be made central to our reading of Marx.) It is because critical narratives of imperialism are constitutive of our collective origin-myths. The story of becoming an 'Indian' academic-intellectual and having to (because there is no other realistic option!) deal in and with thoughts that never fail to remind you of their European origins, does not make sense without there being a concomitant narrative locating the emergence of such an intellectual class in the history of capitalist/European imperialism. To say this is not to claim the privileges of the 'victim'. Imperialism enables as much as it victimises. Without English imperialism in India and a certain training in Anglo-Euro habits of thought, there would not have been any *Subaltern Studies*. The story of 'capital' and that of the emergence of the market-society in Europe—undeniably a historicist narrative in the most popular recensions—have a central place in our collective self-fashioning. It follows then that Marx's critique of capital and commodity will be indispensable for any critical understanding we might want to develop of ourselves. How can a critique of modernity in India ignore the history of commodification in that society? But, at the same time, this relationship to Marx cannot any longer be the straightforward one that the Indian communist parties once encouraged, where the scripting of our histories on the lines of some already-told European drama posed no intellectual problems for self-understanding.

As deconstructive political philosophy increasingly ponders the intractable problem of genuinely 'non-violative' relationship between the Self ('the West') and its Other, and turns to questions of difference and ethics—questions made urgent by the current globalisation of capital, information and technology—the task for students of Marx in my part of the world does not seem to be one of improving 'Marxism' in order to make it impregnable against further assault from the post-modernists. Much in Marx is truly 19th-century, gender-blind and obviously Eurocentric. A post-colonial reading of Marx, it seems to me, would have to ask if and how, and which of, his

categories could be made to speak to what we have learnt from the philosophers of 'difference' about 'responsibility' to the plurality of the world. The age of multinational capital devolves on us this responsibility to think 'difference' not simply as a theoretical question but as a tool for producing practical possibilities for action.

The talk of 'difference' often elicits hostile response from Marxists. There appear to be a couple of things at stake. There is, first of all, the long-ingrained habit of thinking the world through the common, and seemingly universal and solidarity-producing, language of Marxist prose. Secular history itself is a master-code implicit in modern political thought. Historians are comfortable with the talk of difference so long as the talk does not threaten the very idea of history itself. This produces a second-order problem to which there is no quick and readymade solution and which therefore looks to many like an intellectual dead-end. How would conversation proceed between two historians if 'differences' could not be contained within the sameness of the very code (i.e., history) that made the conversation possible in the first place? One may legitimately ask: How can one write/think/talk the non-West in the academia without in some sense anthropologising it? Most historians would prefer to stop at this point and simply get on with the job. Progressive historians would perhaps even endorse the strategy of 'anthropologising': it is part and parcel, they would in effect argue, of the struggle to make the world more democratic. After all, what material benefits can the subaltern classes gain from imaginations in which gods, spirits, humans and animals cohabit the same world? Pointing out that a secular and modern historical consciousness is itself part of the problem of 'colonisation of the mind' for many 'traditions' such as those of the 'Hindus'—I am not making a universal claim and I have put the word Hindu in quotes to indicate its socially constructed and contingent nature—is often of no help to these historians.

Yet, as an Indian historian, this is where I think we confront an almost insoluble problem in writing subaltern history. The problem is also of some critical urgency in India given the current wave of Hindutva. Let me explain the problem of method by referring to this group we have called 'Hindus'. For most Hindus, gods, spirits and the so-called supernatural have a certain 'reality'. They are as real as 'ideology' is—that is to say, after Žižek, they are embedded in practices. The

secular calendar is only one of the many time-worlds we travel. The bringing together of these different time-worlds in the construction of a modern public life in India has always had something to do with all the major crises modern India has had to endure, the most recent being the current upsurge of a fascistic Hindu movement that has already caused enormous sufferings to the Muslims. The usual vocabulary of political science in India, which discusses this problem in terms of European categories of the secular and the sacred and makes this into a question (recycled from European history) of 'religion' in public life, is pathetically inadequate in its explanatory capacity. The word 'religion', everybody agrees, captures nothing of the spirit of all the heterodox Hindu practices it is meant to translate. For however cynical one may be in one's analysis of the 'reasons' why the Hindu political parties may want to use the 'Hindu' card, one still has to ask questions about the many different meanings that divine figures (such as the god-king Rama) assumes in our negotiations of modernity. But this is where I return to the dilemma I posed in the previous paragraph: Do we, in the already universal language of Marxist prose, simply anthropologise these meanings, or do we, in developing a Marxist prose suited to our struggles (i.e., the struggles that arise for modern Indian intellectuals from their being situated in a colonial modernity) also struggle to inscribe into the visions of Marx's critique of capital, horizons of radical otherness?

I cannot pretend to escape these problems any more than other Marxists can, nor do I aspire to do so. The very limited question I can deal with in this short space is: Do Marx's categories allow us to trace the marks of what must of necessity remain unenclosed by these categories themselves? In other words, are there ways of engaging with the problem of 'universality' of capital that do not commit us to a bloodless liberal pluralism that only subsumes all difference(s) within the Same?

Looking back at some work I did on (Indian) 'working class' history a few years ago, I only seem to have half-thought the problem. I documented a history whose narrative(s) produced several points of friction with the teleologies of 'capital'. In my study of the jute mill workers of colonial Bengal I tried to show how the production relations in these mills were structured from the inside as it were by a whole series of relations that could only be considered 'pre-capitalist'. The coming of 'capital' and 'commodity' did

not appear to lead to the politics of equal rights that Marx saw as internal to these categories. I refer here in particular to the critical distinction Marx draws between 'real' and 'abstract' labour in explaining the production and form of the commodity. This is how I then read the distinction (with enormous debt to Michel Henry and I. I. Rubin):

Marx places the question of subjectivity right at the heart of his category 'capital' when he posits the conflict between 'real labour' and 'abstract labour' as one of its central contradictions. 'Real labour' refers to the labour power of the actual individual, labour power 'as it exists in the personality of the labourer'—that is, as it exists in the 'immediate exclusive individuality' of the individual. Just as personalities differ, similarly the labour power of one individual is different from that of another. 'Real labour' refers to the essential heterogeneity of individual capacities. 'Abstract' or general labour, on the other hand, refers to the idea of uniform, homogeneous labour that capitalism imposes on this heterogeneity, the notion of a general labour that underlies 'exchange value'. It is what makes labour measurable and makes possible the generalised exchange of commodities. It expresses itself... in capitalist discipline, which has the sole objective of making every individual's concrete labour—by nature heterogeneous—uniform and homogeneous—through supervision and technology employed in labour process. ... Politically, ... the concept of 'abstract labour' is an extension of the bourgeois notion of the 'equal rights' of 'abstract individuals', whose political life is reflected in the ideals and practice of 'citizenship'. The politics of 'equal rights' is thus precisely the 'politics' one can read into the category 'capital'. ... (Chakrabarty, *Rethinking Working-Class History: Bengal 1890-1940*, Princeton University Press, 1989, pp 225-26.)

It now seems to me that Marx's category of 'commodity' has a certain built-in openness to 'difference' that I did not fully exploit in my exposition. My reading of the term 'pre-capital' remained, in spite of my efforts, hopelessly historicist, and my narrative never quite escaped the (false) question, Why did the Indian working class fail to sustain a long-term sense of class-consciousness?, the meta-problem of 'failure' itself arising from the well known Marxist tradition of positing the working class as a transhistorical subject. Besides, it is also clear from the above quote that my reading took the ideas of the 'individual' and 'personality' as unproblematically given, and read the word 'real' (in 'real labour') to mean something primordially natural (and therefore not social).

But my larger failure lay in my inability to see that if one reads the 'real' as socially/culturally produced—and not as a Rousseauvian 'natural', something that refers simply to the naturally different endowments of different, and ahistorical, individuals—other possibilities open up, among them the one of writing 'difference' back into Marx. For the 'real' then (in this reading) must refer to different kinds of 'social' and hence to different orders of temporality. It should in principle even allow for the possibility of these temporal horizons being mutually incommensurable. The transition from 'real' to 'abstract' is thus also a question of transition from many and possibly incommensurable temporalities to the homogeneous time of abstract labour, the transition from 'non-history' to 'history'. 'Real' labour, therefore, is precisely that which cannot not be enclosed by the sign, commodity, while it constantly inheres in the latter. The gap between real and abstract labour and the force constantly needed to close it, is what introduces the movement of 'difference' into the very constitution of the commodity and thereby eternally defers its achievement of its true/ideal character.

The sign 'commodity', as Marx explains, will always carry as parts of its internal structure certain universal emancipatory narratives. If one overlooked the tension Marx situated at the heart of this category, these narratives could indeed produce the standard teleologies one normally encounters in Marxist historicism: that of citizenship, the juridical subject of Enlightenment thought, the subject of political theory of rights, etc. I do not mean to deny the practical utility of these narratives in modern political structures. The more interesting problem for the Marxist historian, it seems to me, is the problem of temporality that the category 'commodity', constituted through the tension between 'real' and 'abstract' labour, invites us to think of. If 'real' labour, as we have said, belongs to a world of heterogeneity whose various temporalities—Michael Taussig's work on Bolivian tin miners clearly shows that they are not even all 'secular' (i.e. bereft of gods and spirits)—cannot be enclosed in the sign History, then it can find a place in a historical narrative of capitalist transition (or commodity production) only as a Derridean trace of something that cannot be enclosed, an element that constantly challenges from within capital's and commodity's—and by implication, History's—claims to unity and universality.

The prefix 'pre' in 'pre-capital', it could

be said similarly, is not a reference to what is simply chronologically prior on an ordinal, homogeneous scale of time. 'Pre-capitalist' is a hyphenated identity, it speaks of a particular relationship to capital marked by the tension of difference in horizons of time. The 'pre-capitalist' can only exist within the temporal horizon of capital and is yet something that disrupts the continuity of this time precisely by suggesting another time that is not on the same, secular, homogeneous calendar (which is why what is pre-capital is not chronologically prior to capital). This is another time which, theoretically, could be entirely incommensurable with the godless, spiritless time of what we call 'history'.

Subaltern histories, thus conceived in relationship to the question of difference, will have a split running through them. On the one hand, they are 'histories' in that they are constructed within the master-code of secular History and use the accepted academic codes of history-writing (and thereby perforce anthropologise all other forms of memory). On the other hand, they cannot ever afford to grant this master-code its claim of being a mode of thought that comes to all human beings naturally, or even to be treated as something that exists out there in nature itself (remember the tell-tale title of J B S Haldane's book, *Everything Has A History?*). Subaltern histories are therefore constructed within a particular kind of historicised memory, one that remembers History itself as a violation, an imperious code that accompanied the civilising process that the European Enlightenment inaugurated in the 18th century as a world-historical task. This memory does not have the character of nostalgia for it bespeaks a pain that is in no sense historical in our parts of the world.

Of course, the empirical historian who writes these histories is not a peasant or a tribal (and often not even a woman) himself. He produces History—as distinct from other forms of memory—precisely because he has been transposed and inserted—in our case, by England's work in India—into the global narratives of citizenship and socialism. He writes history, that is, only after his own labour has entered the process of being made abstract in the world-market for ideational commodities. The subaltern, then, is not the empirical peasant or tribal in any straightforward sense that a populist programme of history-writing may want to imagine. The figure of the subaltern is necessarily mediated by problems of representation. In terms of the analysis that I have trying

to develop here, one might say that, subaltern is what fractures from within the signs that tell of the insertion of the historian (as a speaking subject) into the global narratives of capital. It is what gathers itself under 'real' labour in Marx's critique of capital, the figure of difference that governmentality—in Foucault's sense of the term—all over the world has to subjugate and civilise.

There are implications that follow: subaltern histories written with an eye to difference cannot constitute yet another attempt—in the long and universalistic tradition of 'socialist' histories—to help erect the subaltern as the subject of modern democracies, that is, to expand the history of the modern in such a way as to make it more representative of society as a whole. This is a laudable objective on its own terms and has undoubted global relevance. But thought does not have to stop at political democracy or the concept of egalitarian distribution of wealth (though the aim of achieving these ends will legitimately fuel many immediate political struggles). But, fundamentally, this thought is insensitive to philosophical questions of difference and can acknowledge difference only as a practical problem. Subaltern histories will engage philosophically with questions of difference which are elided in the dominant traditions of Marxism. At the same time, however, just as 'real' labour cannot be thought outside of the problematic of 'abstract' labour, the subaltern cannot be thought outside of the global narrative of capital though it does not belong to this narrative. Stories about how this or that group in Asia, Africa or Latin America resisted the 'penetration' of capitalism do not constitute 'subaltern' history for subaltern histories do not refer to a resistance prior and exterior to capital. *Subaltern Studies*, as I think of it, can only situate itself theoretically at the juncture where we give up neither Marx nor 'difference', for the resistance it speaks of is something that can happen only *within* the time-horizon of capital and yet disrupts the unity of that time. Unconcealing the tension between real and abstract labour ensures that capital/commodity has heterogeneities and incommensurabilities inscribed in its core.

Or, to put it differently, the practice of subaltern history would aim to take history to its limits in order to make its unworking visible.

REVIEW OF THE YEAR

Indian Manufacturing Industry Growth Episode of the Eighties

D N Sen Gupta

This paper reviews the process of growth in Indian manufacturing in the 80s with a view to exploring the broad interlinkages between growth and the various elements that impinge on it, such as demand, productivity, costs and prices, investment, employment, structural change and the balance of commodity trade

I Introduction

IN many ways, the decade of the 80s was one of the most interesting periods in the history of Indian manufacturing industry. During this period, it broke loose from a state of stagnancy that had persisted for much of the two previous decades. The rate of growth achieved was high not only by Indian standards, but comparable to that of star performers like Korea, Indonesia, Malaysia, Thailand and Turkey. Unlike during the first three Five-Year Plans, growth during this period was not externally induced. It came naturally, in response to a relaxation in policy-based constraints to growth and set in motion a number of highly desirable outcomes. Even so, this growth episode was terminated rather abruptly at the end of the decade, when the government resorted to a programme of demand contraction and import compression to tackle a balance of payments (BoP) crisis of unprecedented magnitude.

This study attempts a quick review of the genesis and process of growth in Indian manufacturing during the 80s. The emphasis is on exploring, in empirical terms, the broad interlinkages between growth and the various aspects that impinge on it, like demand, productivity, costs and prices, investment and employment, structural change and balance of commodity trade.

II The Theoretical Framework

An average car in India today costs less than US \$ 7,000. In the US, it rarely costs less than \$ 15,000. Yet in India only 1,50,000 cars are sold every year, compared with 15 million in the US. The reason is that in India \$ 7,000 represent three years' income of an average buyer, while in the US \$ 15,000 represent less than half a year's income. In other words, except at a very high level of per capita income what determines the demand for industrial products is 'affordability' or the ratio of per capita income to the price of industrial products. At a very low level of income, nothing is affordable. As income rises in relation to industrial prices, affordability starts increasing. In the intermediate stage of development, the ability

of an economy to achieve a high rate of industrial growth thus depends on how rapidly it is able to increase per capita income in relation to industrial prices over time, not only by increasing income, but also by reducing industrial prices in relation to overall prices.

Demand and price would obviously not be relevant in explaining industrial growth (or the lack of it) if, as in the neoclassical system, aggregate output (and therefore income) were determined by resource availability and the maximum possible output of all goods were achieved by relative prices adjusting to 'market clearing' levels. But in reality, costs set a floor to industrial prices which need not be market clearing. Once this floor is reached, prices remain fixed and output tends to adjust to the volume of demand that exists at that level of income and prices. As Kaldor (1975: 353-54) shows, short run equilibrium is reached at a point where output of the industrial sector, after meeting its own demand created in the process of generating that output, leaves a surplus which exactly equals the given demand from outside the industrial sector. Symbolically,

$$Q_i = \frac{1}{1-S} \times D_i \quad (1)$$

where Q_i is industrial output, D_i the given demand for industrial output from the non-industrial sector, S the proportion of industrial income expended on industrial output and $1/(1-S)$ the resultant multiplier (Kaldor's 'foreign trade multiplier'). The above is an identity, any difference between the desired and actual values of S being reflected in changes in inventory levels. As Hicks (1985: 82) points out, the 'storable' nature of manufactured goods which makes possible "the existence of stocks has a great deal to do with the possibility of keeping prices fixed—a market in which stock changes substitute for price changes—is readily intelligible." Demand, owing to the rigidity in costs and prices thus becomes the operating constraint on industrial output.

To see how such a system works over time, it will be useful to introduce price terms and rewrite equation (1) as follows:

$$P_i Q_i (1-S) = A P_e Q_e \quad (2)$$

where Q_i , P_i , Q_e and P_e are the quantities and prices of the outputs of the in-

dustrial and non-industrial sectors, and S and A the proportions of the income of the industrial and non-industrial sectors spent on industrial output. If Q and P be the quantity and the weighted average of prices of the economy's aggregate output, we get

$$P_e Q_e - P Q = P_i Q_i \quad (3)$$

If N be the population, combining (2) and (3) and with minor manipulations, we get,

$$Q_i/N = \frac{Q}{N} \times \frac{P}{P_i} \times \frac{A}{1-S+A} \quad (4)$$

Alternatively,

$$gQ_i/N = 1 (gQ/N + gP/P_i) \quad (5)$$

where, gQ_i/N and gQ/N are the rates of growth of per capita industrial and aggregate output at constant prices, and gP/P_i the rate at which industrial prices fall in relation to overall prices. The terms S and A represent structural variables with whom gQ/N and gP/P_i interact to bring about changes in gQ_i/N .

We may now interpret equation (5) to summarise the dynamic sequence. Faced with the prospect of increasing input costs, firms will try to protect their profitability by estimating future costs and sales volumes and setting prices at a level which, at the estimated sales volume, will cover estimated costs plus a desired return on capital. If no price resistance is foreseen, they will be inclined to 'play safe', make 'conservative' estimates of costs and sales volumes, and set prices high. If there are no major barriers to entry, they will take a more 'optimistic' view of their marketing and cost control efforts and try to discourage competition by keeping prices low. In either case, at the given rates of increase in the aggregate real income and in industrial prices (relative to overall prices), demand for industrial goods will grow at a rate determined by income and price elasticities, and output growth will adjust to it.

Empirical studies by Kaldor, Fabricant, Salter and Kennedy indicate that a high rate of growth in manufacturing is associated with a high rate of growth in labour productivity [Scott 1991]. Salter's findings further indicate that in an efficient industry high productivity is not limited to labour alone, but extends to all inputs, including materials. Fabricant also finds that productivity increase is associated

with a decline in production costs and the latter with a fall in selling prices, and that "selling price has dropped most precipitately in industries in which output has climbed most rapidly." The negative link between increases in selling price and output of manufactured goods has been re-confirmed by us statistically, using recent cross-country data (Table 1).

We would interpret the above empirical evidence as follows. At a certain level of per capita income, demand for manufactured consumer goods, and through backward linkages the demand for manufactured capital and intermediate goods, start picking up rapidly. If an economy is able to translate this demand impulse into a growth in output, the latter leads to an increase in productivity because of economies of scale and 'endogenous' or growth-induced technical progress. If the gain from productivity increase is siphoned off through indirect taxes, it becomes additional income in the hands of the government and may or may not benefit industrial growth, depending on how it is spent. If the productivity gain is retained by industry as increased factor earnings, the resultant income effect on demand is diffused over all goods and not industrial goods alone. If the gain is reflected in falling industrial prices, there is a focused impact on the demand for industrial goods, because the income effect is strengthened by a substitution effect. Three examples of how productivity improvement can expand demand by reducing prices are Henry Ford's 'T' model cars in the 1910s, Courtauld's viscose rayon during the 1920s and 1930s and electronics goods in the last two decades.

How do we reconcile the phenomenon of falling industrial prices with the argument put forward by Chakravarty (1984) and Mitra (1977:141-65) that industrial stagnation can result from falling industrial profits owing to an unfavourable shift in the terms of trade from industry to agriculture? We do so by simply recognising that with sustained reduction in industrial costs through productivity improvements, such a shift can take place without any erosion in industrial profitability. In fact, as Ishikawa (1967:290-347) has shown, in most Asian countries there has been a net flow of resources from industry to agriculture, both through changes in the terms of trade and through invisibles, capital transfers and subsidies. If industrial output grows faster than agricultural output v/t and land constrained, the capacity of the agricultural sector to buy industrial goods will diminish in relation to the industrial sector's capacity to buy agricultural goods, unless sustained productivity improvements allow industrial prices to fall continuously in relation to agricultural prices.

The cost of producing industrial goods has two elements: the fixed costs of investment in knowledge and capital assets, and the variable costs of other inputs. Generation of knowledge, whether in-house or through purchase, involves large investments which are subject to rapid obsolescence. Knowledge, capital and labour-intensive technologies therefore generally represent a descending order of fixed to variable cost ratios. As production volumes build up, it becomes possible to reduce costs by substituting variables by fixed costs and spreading the latter over increasing volumes.

The transition from labour to capital to knowledge intensive manufacturing brought about by industrialisation manifests itself in a steady shift from what Hoffman (1958:21-41) calls 'primitive' to 'capitalist' manufacturing. Since the latter entails increasing use of capital and intermediate goods made by the industrial sector itself, these industries soon outstrip consumer goods industries and the industrial sector as a whole outstrips the primary sector.

Structural transformation has two important consequences. It increases the industrial sector's capacity to sustain its own growth by increasing its 'self-dependence ratio' or the value of λ in our equations (1), (2) and (4). It also enables the 'factory' sector to grow at the expense of the 'cottage' sector. As Ishikawa (1967:338-437) and Anderson (1982) have pointed out, the experience of several Asian countries shows that while institutional characteristics of household enterprises limit their technology choice, factories employ modern technology and bring product

prices down to a level where artisans cannot survive.

The process of structural transformation in an industrialising economy changes the pattern and balance of its external trade over time, by causing a steady shift in its 'comparative advantage'. When the domestic demand for a product reaches a certain volume, domestic production starts replacing imports. Exporting is an extension of the substitution of foreign products by domestic products in overseas markets. Typically, industrialisation starts with the production of labour-intensive consumer goods, initially for home consumption and later for exports. In the process, a domestic demand for intermediate and capital goods is created, which has to be met initially through imports. As the domestic market for these goods builds up, the same cycle of replacement of imports by domestic production, followed by exports is repeated. There is thus a positive link between growth in the output and exports of industrial goods.

TABLE 2. GROWTH AT CONSTANT PRICES
(Per cent per annum)

Industrial growth on the other hand also increases the demand for imports. The overall impact on balance of trade is thus ambiguous.

III

Methodology and Data Sources

Our focus in this study is the 'factory manufacturing sector' and its subsectors. 'Edibles' cover food, beverages and tobacco. 'Other agro'-based industries comprise wood, paper and leather products. 'Hydrocarbons' refer to rubber, plastic, petroleum and coal products. 'Silicates' denote non-metallic mineral products.

All annual rates of change (g) are exponential rates, calculated by regressing time series data on time (t) to yield the following equation:

$$\log Y_t = \log Y_0 + g \cdot t \quad \dots (6)$$

All price indices used are based on those 'implicit' in the National Accounts Statistics (NAS), with 1980-81 as the base year.

In addition to changes in gross value added (GVA) at constant prices, we have used changes in value of gross output (VO) and apparent domestic consumption, both at constant prices, as measures of growth in production and demand respectively.

Subsectorwise estimates of apparent domestic consumption at current market prices (C) have been based on the following equation:

$$C = O_F + T + O_C + M + D - E \quad \dots (7)$$

where, O_F and O_C are the VO of factory and cottage sectors, M and E CIF import and FOB exports, and T and D , the value of indirect taxes levied by the central government on domestic production and imports.

O_F is available from the NAS, M and E from the March issues of the *Monthly Statistics of Foreign Trade of India* published by the DGCIS, and T and D from the annual budget documents of the ministry of finance. Data on O_C are not directly available and have had to be estimated from the value added data provided in the NAS.

For each subsector, as well as the manufacturing sector as a whole, time series data have been used to generate the following double logarithmic demand function which corresponds to equation (5):

$$\ln (Q_i/N) = K_i + e_1 \cdot \ln (Q/N) + e_2 \cdot \ln (P_i/P) \quad \dots (8)$$

where, Q_i/N is the per capita domestic consumption of i^{th} good at constant prices; K_i , e_1 and e_2 are constants, the latter two being interpreted as income and own price elasticities; P_i its price; Q/N the aggregate per capita GNP at constant market prices; and P the GNP deflator.

Growth in O_F could result not only from a growth in C , but also a fall in O_C

or M relative to C (gains from the cottage sector or import substitution), or a rise in E (gain from export expansion). The contribution of these three factors has been estimated by dividing C into four components, viz ($O_F + T$), (O_C), ($M + D$) and (E) and expressing each component as a percentage of C . The changes in these percentages each year, as a percentage of the share of ($O_F + T$) in C in the previous year, would provide year-by-year estimates of growth of the factory sector due to gains from the cottage sector, import substitution and export expansion.

The basic accounting identity underlying our analysis of costs and prices is given below:

$$P_O \cdot O = I \cdot P_I + F \cdot P_F + L \cdot w + (K_F \cdot P_{FK} + K_W \cdot P_{WK}) \cdot r \quad \dots (9)$$

where, O , I , F , L , K_F and K_W are the quantities of output and inputs of material, fuel, labour, fixed capital and working capital; P_O , P_I , P_F , P_{FK} and P_{WK} are the prices of output, materials, fuel, fixed capital and working capital; and w and r are the wage rate and the gross rate of return on capital (PBDIT as a ratio of total capital employed). We can focus on the determinants of P_O better by rewriting equation (9) as follows:

$$P_O = \frac{I}{O} \cdot P_I + \frac{F}{O} \cdot P_F + \frac{L}{O} \cdot w + \left(\frac{K_F}{O} \cdot P_{FK} + \frac{K_W}{O} \cdot P_{WK} \right) \cdot r \quad (10)$$

The rate of change in P_O over time will thus be the result of three rates of change, in input prices, input-output ratios or productivity, and the gross rate of return on capital employed.

The use of the cost accounting framework has several advantages. It allows us to do an inputwise analysis without getting involved with the problems of partial elasticities of substitution. The accuracy of our results are not as critically dependent on the accuracy of fixed capital stock estimation as in productivity studies using 'value added' production functions.

Our approach also allows us to bypass the more basic 'duality' problems associated with such functions.

It is worth pointing out that theoretically our estimates of total productivity will be the same as one would get by assuming a five-input Cobb-Douglas production function, constant returns to scale, Hicks-neutral technical progress and payments to factors according to their marginal revenue products.

The basic source of data for cost analysis is the Annual Survey of Industries (ASI). As the ASI provides data relating to the factory sector only, this analysis is limited to the factory sector.

We have constructed three input price indices by taking weighted averages of price indices of the various components of each input. These relate to materials, fuels and gross fixed investments. Weights have been assigned on the basis of CSO's input-output tables as well as detailed ASI tables for 1983-84.

Wage rate indices simply reflect movements in employment costs per employee

TABLE 4: RELATIONSHIP BETWEEN OUTPUT AND PRODUCTIVITY GROWTH—FACTORY SECTOR (Per cent per annum)

Note: Figures in brackets are negative figures.

(and thus ignore any changes in the qualitative composition of employment). To render the current value of working capital into constant values, we have used the respective ex-factory output price indices on the assumption that working capital is nothing but a stock of final output at various stages of completion.

The theoretical difficulties in aggregating and deflating fixed capital stock are so insurmountable that we would ideally have liked to avoid this exercise [Goldar 1986: 50-56]. But even in our cost accounting framework this is unavoidable, although as we have said before, the accuracy of final results are nowhere as critically dependent on the accuracy of capital stock estimates as in total factor productivity studies based on 'value added' production functions. We have started with Hashim and Dadi's (1973) estimates of gross value of fixed capital assets for 1960 at 1960 prices. Since this is also the starting point for Ahluwalia (1984), we have applied to these figures her estimates of rate of growth in capital stock at constant prices from 1959-60 to 1979-80 to arrive at capital stock figures at the end of 1979-80. These have then been reflatd to 1980-81 prices by using the wholesale price index for machinery and equipment. Annual estimates of gross fixed capital stock thereafter have been derived by adding to this base figure annual figures of gross investment at 1980-81 prices.

From the above data and the book value of net fixed assets, we can now work out a notional price index for fixed capital input with 1980-81 as the base year. Since for costing purposes the gross rate of return on capital is calculated on the basis of current (or book) value of capital employed, this notional price index is in fact the relevant index of increase in the price of fixed capital input. Conceptually, it encompasses increases in the purchase price of new fixed capital over time as well as a fall in relation to new capital in the value of fixed capital acquired in the past because of obsolescence. For reasons ex-

plained by Scott (1991:14-33), depreciation provisions should be seen as a 'write off' for obsolescence rather than physical wear and tear and actual discard. Physical wear and tear is usually taken care of by repairs and maintenance, the cost of which is charged to revenue expenditure.

Data at current prices have been converted into constant prices by using the appropriate output and input price indices. The constant price data give us annual changes in input-output ratios or productivity. We can also calculate for each year the value of 'r' and changes in

this value. The impact of changes in input prices, input-output ratios and 'r' on output price each year can now be worked out by applying the rates of change in these to the previous year's shares in total costs of each input. We can also calculate period averages by using average annual rates of change in all these variables over the entire period and the average share of each input in total costs for the period as a whole.

All exports of gems, jewellery and handicrafts have been assumed to have been made by the cottage sector. The

residual exports of manufactured goods by subsectors have then allocated between the factory and cottage sectors in proportion to their VOs.

For calculating import intensity of manufacture, all imports of crude petroleum, chemical grade non-metallic minerals (basically sulphur, phosphates and potassium), other non-metallic minerals, metallic ores and scrap and cooking grade coal are assumed to have been used as inputs by the hydrocarbons, chemicals, silicates and metals (last three items) subsectors respectively.

Imported manufactured goods are used not only as inputs for the manufacturing sector, but also as inputs for other sectors as well as for meeting final demand. We have therefore used the following indirect procedure which in our view would yield approximate but usable estimates. Using equation (7) we can work out for each category of manufactured inputs the proportion of M in C or the CIF import to consumption ratio. The second step is to calculate on the basis of input-output tables, what proportion of materials, fuels and gross fixed investment in each subsector is accounted for various categories of manufactured inputs. By applying these two ratios to the annual subsectorwise actual figures of materials and fuel consumption and gross fixed investment, an estimate of import of manufactured inputs can be derived for each subsector.

The estimation procedure for self dependence ratios is the same as for imported manufactured inputs, with two differences. For obvious reasons, only the second of the two ratios described above has been applied to actual figures of consumption of materials, fuels and gross fixed investment. Secondly, 19.3 per cent (that being the relevant figure in the 1983-84 input-output table) of gross value addition by each subsector has been assumed to have been spent on manufactured consumer goods via factor earnings.

IV

Empirical Findings

The genesis of the high growth episode of the 80s in Indian manufacturing is best explained in a historical perspective, by dividing the post-independence period into three phases: a high growth phase up to the mid-60s (phase I), a low growth phase from the mid-60s to the end-70s (phase II), and a high growth phase in the 80s (phase III). Table 2 compares some salient features of the three phases. Growth during phase I was externally induced by heavy public investment in the capital and intermediate goods sectors and, as pointed out by Bhagwati and Desai,¹ by extensive import substitution in all sectors, especially consumer durables and intermediate goods. While many explanations have been advanced

for the deceleration in phase II, the most plausible line of reasoning seems to be as follows. The external impulses to growth started petering out, as public investment in industry slowed down and the potential for import substitution was increasingly exhausted [Sandesara 1992: 122-33]. At the same time, an expansionary supply response to the rising demand for consumer goods was impeded by increasing levy of indirect taxes, a restrictive industrial policy and poor infrastructural support [Ahluwalia 1984]. This led to a recession in the capital and intermediate goods sectors also. The low domestic output of consumer goods could not support the capacity created for the production of capital and intermediate goods. Much of this capacity was too inefficient to be competitive in export markets.

During phase III, not only did the demand for consumer goods pick up (as reflected in the growth in per capita GNP), but a change in policy orientation allowed this increase in demand to be met with an expansionary supply response. The output of both consumer durables and non-durables grew rapidly. This in its turn started pulling up the output of capital and intermediate goods. Thus, the distinguishing feature of this phase is that the growth was demand-induced.

As we shall see later, indirect taxes as a proportion of selling prices of manufactured goods remained on the whole stable during the 80s and did not choke off demand impulses. Changes in industrial policy encouraged an expansion in supply both by removing obstacles to production and encouraging competition. Specifically, there was delicensing, broad-banding and endorsement of industrial capacity; greater freedom to larger producers through an increase in the asset limit for MRTF purposes and an expansion in the Appendix I list; encouragement to financial and technical collaboration agreements as well as to foreign investment from OPEC countries and NRIs on a fully repatriable basis; and full or partial decontrol of the pricing and distribution of a number of commodities. Ahluwalia (1991: 85-88) has pointed out that industrial production was also aided by a distinct improvement in infrastructural support, both due to higher public investment in infrastructure and increased efficiency.

Output of the factory sector grew faster than domestic consumption, due largely to a gain from the cottage sector and, to a smaller extent, from export expansion (Table 3). The relative contraction of the cottage sector which has been pronounced in the more traditional subsectors, corresponds to the Ishikawa-Anderson hypotheses.

Productivity of the factory sector increased in response to the growth in output. Table 4 establishes a statistical rela-

tionship between the two. The values of the intercept and x-coefficient of -1.51 and 0.41 respectively imply that productivity growth is negative until the rate of growth in output reaches 3.7 per cent p.a. Thereafter, productivity increases by 0.41 per cent with every 1 per cent growth in output. This finding is similar to Ahluwalia's (1991: 133-40), who has used data for 62 subsectors going back to 1959-60, total factor productivity estimates based on value added production functions, im-

port substitution as an additional independent variable and a dummy variable for the period starting 1980-81. Her estimates for the 1980-81 to 1985-86 period of the corresponding values of the intercept and x-coefficient are -1.23 and 0.51 respectively.

The sources of productivity increase show a fairly consistent pattern across subsectors (Table 5). Although the reduction in material input per unit of output was not very large in percentage terms, in absolute terms the contribution of material savings to productivity increase was the largest, owing to the preponderance of materials in total costs. The next highest contribution came from labour, in percentage terms the reduction in labour input per unit of output being the biggest of all inputs. There has also been a significant reduction in working capital input. On the whole, there has not been any significant change in fixed capital input (or the 'capital-output ratio'), although there are variations by subsectors. Fuel input has gone up consistently, probably as a substitute for human energy.

Rising input costs were partially offset by improving productivity (Table 6). For the manufacturing sector as a whole, about 10 per cent of the productivity gain was retained as increased return on capital employed and the balance passed on as a reduction (or lower increase) in ex-factory prices.

As Table 7 indicates, the fall in ex-factory prices was reflected in a fall in market prices (relative to input costs and overall prices). The effect of the incidence of indirect taxes on prices was on the whole neutral, increases in some subsectors being matched by decreases in others. Consequently, in all subsectors except metals market prices increased less rapidly than input costs. The difference was quite substantial in some of the subsectors.

A comparison of the average return on total capital employed (ROC) earned in various subsectors indicates that this varies widely, from 14.6 per cent to 36.7 per cent (Table 8). There has also not been any tendency for it to equalise across subsectors over the period. In general, profitability has been high in the high growth subsectors. As indicated by the value of the intercept, at a zero rate of growth average ROC (including depreciation) is about 12 per cent which is lower than the average long- (14 per cent) and short-term (17 per cent) rates of interest that prevailed during the 80s. The value of the x-coefficient of 1.8 indicates that (i) an average break-even was achieved at a positive rate of growth of 3-4 per cent.

In all subsectors except silicates, falling prices have had a stimulating effect on demand (Table 9). In metals, prices have risen and this has had a dampening effect on demand.

The period average rates of change in per capita incomes and prices have been applied to the implicit income and price elasticities to arrive at an estimate of the contribution of each factor to growth in demand over the decade as a whole (Table 10). For the manufacturing sector as a whole, price would seem to have contributed about a quarter of the growth in demand (in per capita terms). For some of the subsectors, the contribution was much higher.

Over the decade, growth of the manufacturing sector did increase its ability to sustain its own growth to some extent, as reflected in a small increase in its 'self dependence ratio' (Table 11). The increase came essentially from an increase in investment in machinery and equipment.

Table 12 provides annual data on exports and imports of manufactured goods over the decade. Since much of the growth in exports came from gems, jewellery and handicrafts which are made by the cottage sector, the exports of the factory sector are shown separately. Exports, both total and of the factory sector, rose faster than imports, so that the trade deficit narrowed over the decade. However, the low rate of increase in imports is attributable to Bombay High and is unlikely to be sustained in future years.

Of the possible general explanations for the healthy growth in manufactured exports in the 80s, two seem *prima facie*, more important than the others. The growth in output itself could have stimulated growth in exports. Secondly, there was a substantial fall in the foreign exchange value of the rupee especially during the second half of the decade and this might have increased the motivation and competitiveness of Indian exporters. These two hypotheses have been tested through a two variable regression analysis, where India's dollar exports have been expressed as a function of the rate of growth of output at constant prices and the fall in the dollar value of the rupee. The results are summarised in Table 13. Growth in exports seems to have had a positive link with growth in output: for every 1 per cent growth in real output, exports have increased by 2.25 per cent. The fall in the dollar value of the rupee on the other hand appears to have had a negative association with the dollar value of exports. This presumably means that on the whole export values are fixed in rupee terms and a drop in the dollar value of the rupee leads to a fall in sales realisation in terms of dollars.

Of the six subsectors where the regression analysis has some statistical validity

ty, four (i.e., hydrocarbons, chemicals, engineering and unclassified) conform to this general pattern. Exports of textiles, on the other hand, have benefited from the fall in the dollar value of the rupee. One may interpret this to indicate that here India is just one supplier in the global market where prices are fixed in terms of foreign exchange and a fall in the exchange value of the rupee enables India to reduce prices and pick up a more than proportionate increase in volume. Other agro-based products (essentially leather goods) seem to have benefited from both growth and the fall in the exchange value of the rupee.

From the point of view of assessing the effect of industrial growth on the balance of external trade, a more comprehensive and important indicator is changes in 'the import intensity of manufacture' or the CIF value of imported inputs used per rupee of gross value added by the manufacturing sector. This can be measured either in gross terms or net of the value of FOB exports of manufactured goods. For reasons of data availability, estimates of this figure have been possible only for the factory sector (Table 14). In gross terms, this figure has fallen from 47 p in 1980-81 to 30 p in 1988-89. This finding is consistent with unpublished estimates quoted by Jalan (1991). According to which the value of imported inputs as a proportion of the value of 'industrial outputs' were 15.7 per cent and 11.2 per cent for 1981-82 and 1987-88 respectively. Net of FOB exports, there has also been a similar fall, from 28 p to 11 p. However, if one looks at a componentwise breakdown of this figure (Table 15), the position seems less satisfactory. In gross or net terms, the fall has come entirely from a reduction in the import of crude petroleum (because of Bombay High) which may not be sustainable. An increase in machinery and equipment and primary sector inputs (excluding crude oil) has been compensated by a fall in manufactured inputs. Of the subsectors hydrocarbons, silicates, metals and engineering are fairly import-intensive in net terms (Table 16). Contrary to popular belief, chemicals are not.

V

Strategy for Industrial Development

Experience has taught us the futility of trying to attain many objectives at the same time. Our analysis suggests that if we concentrate on growth as the main plank of our strategy, many of the other desirable outcomes should follow.

Our analysis also confirms that the three major pre-requisites for growth are a viable market, competitive pressures to ensure that firms respond to increases in demand by expanding supply (and not in-

creasing prices), and availability of supply side facilities like infrastructure, factor endowment, vendor industries, etc. Some countries like Japan and South Korea have developed at the initiative of local companies who initially concentrated on substituting the import of consumer goods. As demand for intermediate and capital goods built up, imports of these goods were also substituted by local production. Exports were an extension of substitution of foreign by local goods in overseas markets. Local companies were protected from external competition at home, but efficiency was ensured by promoting competition amongst local companies and creating good supply side facilities. A second model of development is illustrated by the ASEAN countries where development took place at the initiative of multinational companies (MNCs), mainly American and Japanese. The MNCs set up production bases in these countries to take advantage of cheap labour and supply to global markets.

The second alternative does not seem to hold out much promise for India. Unlike in Malaysia, Thailand and Indonesia, India has a large base of local entrepreneurs whose primary interest is the local market. Even the MNCs seem to be similarly inclined. For the purposes of setting up export platforms, the MNCs are already shifting their attention to Vietnam and China in a big way. These two countries combine low wages with industrial discipline which the communist governments are able to ensure. China also has the advantage of being the natural choice of the overseas Chinese who are prodigal savers and investors. Of her total receipts of direct foreign investment of US \$ 11 bn in 1990, two-thirds came from Taiwan and Hongkong. Another 15 per cent came from the Chinese minorities in Malaysia, Thailand, Indonesia and the Philippines who own very large shares of the total economic assets in these countries.

TABLE 12. IMPORTS AND EXPORTS OF MANUFACTURED GOODS (1980-81 to 1988-89)

	Imports (CIF)	Exports (FOB) Total	Factory Sector	(b) as Per Cent of (a)	(c) as Per Cent of (b)	(c) as Per Cent of (a)	As Per Cent of Ex-Factory Value of Output Exports Imports	
	(a)	(b)	(c)					
1980-81	7611	3996	2335	53	58	31	5.2	9.9
1981-82	7663	4724	2742	62	58	36	5.1	8.4
1982-83	8400	4853	2790	58	58	33	4.7	8.1
1983-84	9608	5501	3063	57	56	32	4.8	8.3
1984-85	11350	6354	3708	56	58	33	4.8	8.5
1985-86	13230	6755	3908	51	58	30	4.5	8.6
1986-87	13243	7362	3872	56	53	29	4.4	7.8
1987-88	13315	9759	5240	73	54	39	5.1	6.9
1988-89	17077	13998	7274	82	52	43	6.2	7.5
1989-90	21824	19771	11127	91	56	51	7.5	8.3

It does seem therefore that our emphasis should be on exploiting the demand impulses that exist locally by taking a pragmatic view of the rising domestic demand for consumer goods, durables and non-durables, and convert it into growing output. This will pull up the demand for and output of capital and intermediate goods automatically.

TABLE 13: MANUFACTURED GOODS—GROWTH IN EXPORTS AS A FUNCTION OF GROWTH IN OUTPUT AND THE FOREIGN EXCHANGE VALUE OF RUPEE

Miscellaneous	1.97 (0.41)	-1.67 (0.70)	0.95
Manufacturing	2.25 (1.73)	-0.90 (1.57)	0.75

Note: The following regression equation has been fitted to annual data from 1980-81 to 1989-90

$$\ln Y = a + b \ln X_1 + c \ln X_2$$

where Y, X_1 and X_2 represent exports in million US \$, gross output in Rs '000 crore at 1980-81 prices and exchange rate in Rupees/US \$ respectively.

It may be asked if this kind of 'consumption led' growth is sustainable in view of the 'narrowness' of the demand base.² The answer, to our mind, is an unequivocal 'yes'. As pointed out earlier, sustained growth should lead to increasing productivity, falling industrial prices and a rising demand for industrial goods in the non-industrial sector, especially the agricultural sector. Growth should also increase the industrial sector's demand for its own output, through a process of structural transformation.

Rising demand will be translated into growing output only if firms are motivated and enabled to make their profits from volumes rather than prices. Motivation will depend *inter alia* on two things: competition and a non-inflationary environment. International experience since the mid-70s shows that economies with low rates of inflation have grown rapidly.³ Inflation affects relative prices and producers are often able to gain at the expense of consumers by restricting output and charging high prices. Secondly, high inflation is normally associated with a high degree of price instability which increases uncertainty and risks and discourages industrial investment.

The ability of firms to expand output will depend on the availability of supply side facilities. In view of difficulties in raising resources for public investment, infrastructure could well become a constraint to industrial growth, unless the private sector is persuaded to play an expanding role in infrastructural development. For this, investment in the infrastructural sector must become profitable, either directly or through its effect on final output. This will require a pragmatic approach to pricing and distribution control.

Not only must the state be concerned with removal of supply bottlenecks, but it should also provide strategic leverages. A good example of this is how the Japanese government stimulated the growth of a powerful 150 million tonne steel industry after second world war which enabled the Japanese automobile, ship building and home appliances industries to become competitive in the world market. In recent times, they have catalysed the development of a highly efficient electronics industry which has lent a cutting edge to a number of other industries. Singapore leveraged its locational advantage by creating phenomenal infrastructural facilities.

As we have seen before, growth and competition may be expected to bring about a fall in ex-factory prices of industrial goods. But for this to be reflected in market prices and have an expansionary effect on markets, government must also pursue a policy of raising revenue from an increase in volumes rather than in the tax rates and administered prices. A useful

start has been made with indirect taxes in the 1993 fiscal budget. But a lot remains to be done. Most state governments are yet to fall in line. The tax rates on many commodities are still very high. The cascading effect of taxes on prices remains to be eliminated through value added taxes. Administered prices continue to be raised several times a year.

Rodrik (1990) has emphasised the importance of 'sustainability' in designing structural re-adjustment programmes. From this point of view, perhaps the biggest question mark relates to India's ability to create a large enough trade surplus to service a rapidly increasing debt burden.

It will be unrealistic to expect a pick-up in world trade in the near future. The slowing down in world trade will heighten

protectionism and competition. Our analysis suggests that if we are able to achieve a high rate of growth in manufacturing, exports of non-traditional manufactures should increase. But this may not be the case for traditional manufactures like textiles which still account for a large proportion of total exports. Growth, on the other hand, will induce an increase in imports, especially of petroleum products and this could be aggravated by an increase in crude prices. We should therefore continue to take a cautious view of imports. Rather than physical controls, prime reliance should be on tariffs. While a further lowering of the general level of import tariffs will encourage competition and growth, some rationalisation in the tariff structure is called for. The tariff rate should increase at each successive stage in

the value addition process with a view to encouraging value addition within India. Secondly, there should be a long-term thrust on efficient import substitution in some critical areas, like oil (by other forms of energy), metals, agro-based products and services.

From the role of the state, we may now turn to the role of the firm. The development process suggested here will lead to a natural transition from consumer to intermediate to capital goods, and from labour to capital to knowledge-intensive technology. The sequencing of development in India has on the other hand been similar to that in planned economies, like China and east European countries. The emphasis has been on building manufacturing capacity for intermediate and capital goods and limiting the growth of consumer goods. The resequencing of development, in line with natural transition, will call for a two-dimensional restructuring at the firm level. First, the imbalances will have to be corrected by shedding excess capacity in pockets of surplus and by creating new capacity in pockets of shortages. In the process, resources will be re-allocated between firms, products, factors and geographical locations. Secondly, a qualitative upgradation of both existing and new capacity will be required to increase productivity and competitiveness of Indian industries.

Indian companies have tended to add to their product portfolio as finance and industrial licences have become available, without any reference to their core competencies. They will have to identify and develop their core competencies and build their product portfolios around these. Companies that do this successfully could end up with a trimmer portfolio, but the loss of revenue if any will be more than offset by the consequent shedding of costs.

The usual approach to downsizing in the US and Europe is to reduce costs by shutting down plants, retrenching people and squeezing suppliers. A second approach, often used by Japanese firms, is to keep existing ties intact, but postpone expenses like new investments, new recruitments and even wage/dividend/supplier payments. For a developing economy like India's, the scope for the latter approach should be fully explored.

Companies have traditionally sought to reduce costs by setting up large, integrated plants. But recent trends indicate that outsourcing (or buying out) can often be a more cost effective alternative. Recent developments in technology make it possible to produce economically in small batch quantities. The Japanese method of 'lean manufacture' achieves this in the engineering industry by eliminating the inflexibilities and the 'flab' (like excess inventory, re-work, factory space, etc) essen-

tial for uninterrupted large-scale production. The small steel plants in the US have brought down optimal capacity from seven million to one million tonnes, by developing new technologies like small furnaces, continuous casting, 'coil-box' rolling, etc. Secondly, small, highly specialised vendors are able to reduce costs through higher efficiency (e.g., Japan's Keiretsu, Europe's state of the art component suppliers, California's Silicone Valley). And thirdly, by decentralising development to small units, commercialisation of innovations is speeded up. In India too outsourcing is gaining ground (e.g., in automobiles, pharmaceuticals, consumer goods, etc), but the main reason seems to be the wage and tax advantages of small firms rather than any fundamental technological or economic considerations.

MNCs have kept costs under control by shifting production bases across countries. Prima facie, there is much scope for reducing costs by relocating production bases within India. Owing to government regulations, companies have so far been limited to finding new locations for their new projects only. It will be worth examining the scope for relocating existing facilities.

Companies try to achieve economies of scale by pooling resources. One way of doing this is through mergers and acquisitions. A more recent development is strategic alliances. Machine tool manufacturers in Germany have come together for sales, distribution and servicing in international markets. Several automobile manufacturers have finalised joint manufacturing arrangements whereby one manufacturer will produce specified parts for all. German producers of steel have joined hands in certain areas of manufacture. In a regulated environment like India's, takeovers have largely been limited to those from multinationals and strategic alliances have been practically non-existent. But two recent deals indicate that these could offer interesting opportunities for cost reduction.

A recent study by the Harvard Business School [Porter 1992] indicates that the firm level approach to industrial investment in 'profit'-oriented countries like the US is different from that in 'growth'-oriented countries like Japan and Germany. The US companies plough back a smaller proportion of their added value and pay out a higher proportion by way of wages and dividends. They also spend a higher proportion of their investment on physical assets like plant and equipment. The Japanese firms on the other hand spend a much higher proportion on building the three basic foundations of long-term competitive advantage: knowledge (e.g., R and D, HRD), reputation (e.g., corporate/brand image) and what Kay (1992)

calls architecture (a stable relationship between the firm and its customers/vendors/employees/shareholders). In a protected environment, the approach to investment in Indian firms is likely to have conformed more to the US model and will need to be re-oriented.

Notes

[This study is based on the author's research at the Indian Institute of Management, Ahmedabad. The author is grateful to J C Sandesara and G S Gupta for their helpful comments. They are naturally not responsible for any deficiencies that remain.]

- 1 See Bhagwati and Desai (1970), p 91. They find that between 1951 and 1957, emphasis was on import substitution of consumer goods, followed by capital and intermediate goods. Between 1957 and 1963, the priority shifted to capital goods, followed by intermediate and consumer goods.

Electronic Reorganisation of Manufacturing

A New Techno-Economic Paradigm

Annavaiah J C B

The study examines the predicted and actual impact of new flexible production technologies on industrial production organisation in industrial countries. By outlining the problematic context in which these technologies evolved as appropriate responses to certain challenges faced in production and distribution, it then highlights the point that these technologies have contributed to productive integration as also decentralisation at the domestic and international levels. Evidence gathered here does not fully endorse the relocationist or anti-relocationist (trade reversal) views. In general, it seems we are in a non-monotonic flux of 'much can be said on both sides'.

INTRODUCTION

WE know that process technology is the technology that determines the way in which products are made. This review article is just an exploratory inquiry into new process/manufacturing technologies *stricto sensu*, in particular of micro-electronics based or computerised production technologies. In what way do these new technologies impact on the 'make-buy' or production sub-contracting policies of firms? That is the complex question that especially concerns us here.

The general model of technological choice for less developed countries (LDCs) *a la* Frances Stewart conveys us that since LDCs are largely technology recipients and developed countries (DCs) technology originators, the 'technology in use' in an LDC is a function of 'technology available' to that country, which in turn is a function of the development of 'world technology' (basically in DCs). In this three-stage model which is needless to be elaborated here,¹ if we note that 'technology in use' in an LDC is ultimately structured by the 'selection mechanisms' prevailing in that country on the basis of diverse producers with diverse objectives and diverse as also certain common (economywide) constraints and opportunities, then it would be fruitful to probe further into the make-buy decision processes of large and small-medium firms in the modern industrial sector—multinational subsidiaries, joint ventures, purely technology importing and non-importing firms etc, all with export orientation or domestic market orientation or a mix of inward and outward looking. Such research would help us understand with policy implications, the role of inter-firm linkages in economic development in general, and in large firm based dualistic development and small firm based regional development in particular. This task would be all the more interesting in the recent context of policy reforms in India where, broadly speaking, policies of 'shou' (restriction) have given way to policies of 'fang' (liberalisation, in Chinese) by way of 'deregulation-cum-opening up' in order to set this 'morbid and moribund tiger' free for a 'healthy and vigorous' growth.

However, research on these lines, especially in terms of the impact of technological change (new products and new processes) on the subcontracting behaviour of firms, is conspicuous by its absence. Moreover, it calls for primary studies, at least on industries rich in vertical linkages, with the usual attendant problems of non-response from the sample firms for an individual native researcher. Of course, there have been occasional newspaper and business magazine reports, for example on automobile and electronics industries, which seem to suggest that the entry of new products and processes through foreign technical collaborations/direct investments does not augur well for the modern small-scale subcontractors and ancillary units which have been tuned to conventional (mechanical and electro-mechanical) technologies.²

However, the present use and diffusion of the newly emerging technologies already points to a wide application and a sustained economic impact in the DCs. In the light of a large body of literature on this topical subject in these countries, the discussion here is organised as follows: Section I deals with nature and effects of electronic controlling of machines, Section II with flexible automation of final assembly and parts making, Section III with Computer Integrated Manufacturing (CIM), Section IV with impact of CIM on production organisation, and finally Section V deals with CIM and international sub-contracting of industrial production, in particular.

I

Electronic Controlling of Machines

Microchips are used not only in several products,³ but even in the machines that are used to make them. Consequently, worker control of machines has been progressively eliminated and the unit of control has been installed in the machine itself. This has altered the production techniques and the connected labour process. The trend in engineering firms has been to replace mechanical and electro-mechanical controls by electronic control systems.

The objective of this replacement is to drastically reduce the machine shop work in production. One such instance, where a manufacturer of control units for machine tools in Italy shifted from electro-mechanical to electronic control systems is as follows: "With the appearance of micro-electronics in the 1970s the firm began to run down its machine shops and progressively intensified putting out which eventually accounted for 60 per cent of production costs. At this time the firm employed about 500 workers directly and over 900 indirectly as outworkers. A couple of years later with the introduction of automation the firm recentralised production and an estimated 600 outworkers lost their jobs."⁴

The electronic controlling of machines with microchips has the capacity of replacing almost all human activity in factories. A study points out that "in industrialised countries, over half and possibly three-quarters of the functions carried out by plant operators demand no more observation, analysis and decision than can be performed by quite modest micro-processors as they have been developed to date".⁵

With prices falling by the day and their cost constituting just a fraction of the annual cost of a worker, there has been rapid acceptance of micro-processor/micro-computer based capital equipment, not only by the big but even the medium and small firms.⁶ According to some estimates, "the relative price of a robot to a worker dropped in the 1970s from about four times to 1.4 times, owing to rapid wage increases on the one hand and increasingly competitive pricing of robots through cost improvements in production on the other. This trend will certainly continue, so that the robot becomes a cost effective labour substitute, even without taking account of the fact that the robot requires no fringe benefits or holidays, can work extra shifts, needs no tea breaks, does not engage in labour disputes and provides a consistent level of quality output that human labour cannot supply."⁷

The amazing flexibility of a micro-processor's use by reprogramming has made irrelevant the top managements' strategies of overcoming the problem of

changing the functions or methods of operating in a workforce. Moreover, micro-processors and the related automation have become the most important 'strike-breaker'. For instance, in the US, "during the well known strike of 1975 in the aerospace industry, McDonnell-Douglas' management was able to maintain production at 60 per cent with the use of micro-processors and automation. In another well known strike in 1973, General Motors' management was able to easily shift production from one sector of the industry to another by the use of micro-processors that have pre-designed all the different changes required in the labour process."⁸

The above are some powerful factors hastening the shift from labour intensity to capital intensity in manufacturing industries. As Sir Maddock has pointed out, until the advent of the minichip microchip, "the capital equipment which was needed to displace labour was very expensive, at least (in ball-park terms) 10 times the annual cost of labour and frequently as much as 100 times. This meant that the management in a factory had to make a careful judgment as to its capital-labour ratio. Capital was a fixed cost and a liability in slack times; labour was a variable cost and thus, until recently, could be shed in bad times." Now no such constraint is faced.⁹

II

Mass Production vs Flexible Automation

As long as markets expanded till the early 60s, mass production for Fordism had its hey-day. But when relative market stagnation set in alongside the rise of labour absenteeism, turnover and rebellion, the employers realised the futility of the semi-automatic mass producing assembly lines and the mainstream economics suddenly discovered 'diseconomies of scale'. The changing product market conditions induced countervailing trends in the work organisation that disproved the inevitability of monotonous deskilling of workforce as propounded by Braverman.¹⁰ Small, 'semi-autonomous work groups' trained in a large number of operations and not subject to rigid job description, and with pay levels linked to training, were suddenly hailed for their 'job enrichment and satisfaction'. But in reality they amounted to increasing the flexibility and work intensification by increasing the skilled content of production work. A classic example of these experiments has been that of the Swedish automobile maker, Volvo.¹¹

In this milieu, a new science of ergonomics—a mixture of engineering, medicine and psychology—took off to study human performance and human

factors in work, machine control and equipment design. It amasses knowledge of movements of major body sections, perceptions and cognition, work environment and organisational aspects of work, in order to increase operational efficiency and operator safety, and to ensure reduced but optimal efforts by the worker.¹²

However, the ultimate thrust of production engineering has been towards the application of micro-electronics based technologies. The use of microchip based capital equipment has become absolutely necessary to slash costs, allow variation in product and cope with the pressing innovative era of shrinking product life cycles. Technological change has reduced the life cycles of manufactured goods in general to 4-5 years and consumer electronics in particular to 2-3 years.¹³ As such, flexible automation of final assembly as well as parts manufacture has been a better option than the radical experiments made in the 60s and early 70s to ergonomically restructure special purpose, dedicated (old-fangled Fordist) assembly lines into many bays or islands of reskilled workers, which then encountered the bottleneck of inflexible (special purpose) machine capacities in the firms supplying parts and components.

It is in this problematic context—how to have a wide-ranging machine capacities for long runs and more urgently, for short medium runs to match the complete range of marketing needs—that we must need posit the panacea—both at final assembly and parts making levels—provided by programmable capital equipment, viz, computerised machining centres¹⁴ and industrial robots, the two wonders of the chip age.

It may be noted that in conventional final assembly of high volume identical product, special purpose machines or 'troublesome' humans (or a mix of both) are used. The specialised machines are very expensive, but are fatigue-proof, efficient sum of jigs and fixtures (special tools and parts holders). They are built to repetitively perform one fixed operation or a closely related series of operations on just one product. When models on the production line or product designs change, these machines cannot be altered immediately. Even a slight variation in parts (because of errors usually arising from the tolerance limits within which all production processes are permitted to vary) have often been found to jam the machines as much as a third of the time.¹⁵ But adaptive (in relation to errors) and programmable (in relation to model or design change) robots have been used in Japan to make even mass production (justified by the market size) flexibly efficient.¹⁶ However, by late 1970s itself it was found

that high volume assembly consisted of only 5 per cent of all goods manufactured in industrialised countries.¹⁷

The real challenge has been to profitably automate low volume assembly of majority of end-products, i.e., products manufactured in batches, with wide style variations and short design lives in small quantities. Here too intelligent robots (i.e., tools with minds of their own) or robots with cognitive planning, and which can rotate, bend, extend, or move up and down, right and left and which are instantly reprogrammable to adapt to product change, have begun to take up positions to ultimate assembly lines.¹⁸

Though robots have generally been deployed in tedious and hazardous work, the thrust of their development has been towards higher speeds, sight and touch sensors, and miniaturisation. In Japan, intelligent robots have already successfully taken up small assembly runs of pumps, compressors, air blowers, speed-change gears, calculating machines, typewriters, woollen yarn knitters, sewing machines, freezing machines, extinguishers, valve cocks, gas appliances, oil appliances, ventilators, washing machines, lighting fixtures, radio sets, television sets (household electric appliances), semiconductor elements, integrated circuits (electric and electronic parts), automobiles and auto parts and so on and so forth. Intelligent robots have come into the inspection process too.¹⁹

Flexible automation of parts manufacture at the small- and medium-size subcontract or independent units have developed in tandem with computerised small-lot final assembly as demand for parts in small-medium lots has shot up. Here also computer technology has created general purpose numerical control machines and intelligent robots and overcome the uneconomical problematic of small-batch engineering.²⁰

In this connection, it may be noted here that the operators of traditional general purpose machines (the lathe, the milling machine, the drill press, etc) performed the following seven functions:²¹ (1) move the proper piece to the machine; (2) load the workpiece on to the machine and affix it rigidly and accurately; (3) select the proper tool and insert it into the machine; (4) established and set machine operating speeds and other conditions; (5) control machine motion, enabling the tool to execute the desired function; (6) sequence different tools, conditions and motions until all operations possible on that machine are complete and (7) unload the part from the machine. With the development of numerical machine control from the mid-1950s by way of punched-tape information storage and then by magnetic-

disc storage or computer memory storage (which yielded a computer-numerical-control system that simplified the editing and altering of parts programme and made it possible for the computer to take over several auxiliary functions like pre-selecting the next tool and having it ready when it is needed), and then by direct numerical control system (whereby a group of machines is controlled by a single computer), the following computer-managed parts manufacturing system came into existence. "...a number of machines are linked together, not only through a common control computer but also through a part-transfer, load/unload system. Apart from tool and machine maintenance, the only direct operator activity is attaching the workpiece to special pallets (load) and removing the finished product (unload). Once a workpiece has been loaded and the computer has been informed that it is ready to enter the system, the computer takes over, routes the workpiece to the necessary machines, selects the proper tools, executes the proper operations and when the part is finished, returns it to the operator for unloading. At the machine itself all seven of the required functions have been automated, with the result that the operator services a system of machines rather than a single machine."²² This system, eminently suitable for small-batch parts making, has been subject to further advancements like increasing the speed of processing and so on. The severe headache of 'set-up costs' has been thereby successfully prevented.

We are thus far dealing here with flexible automation at both final assembly and parts making levels. So much on this theme. The central point that follows, in the words of an OECD Industry Committee's report, is that micro-electronics based or computer production technologies, "because of their high degree of flexibility enable low production costs to be attained even for small production volumes. This increase in the *economies of scope* of the manufacturing process thus no longer requires long runs to be produced to obtain important reductions in unit cost."²³ Economies of scope due to flexible manufacturing (i.e., flexibly using shared inputs in the process of producing diverse products in order to satisfy consumers' demand for diversity and quality) thus characterises the new techno-economic paradigm, in contrast to the economies of scale associated with dedicated manufacturing (i.e., using highly specialised capital equipment to turn out standardised/identical high volume goods). In nutshell, flexible manufacturing has smashed the obstacle of capital fixity (i.e., horizontal constraints on capital as in Fordist assembly lines) and has the power of flexibly using capital to produce different varieties of products.²⁴

III Computer Integrated Manufacturing (CIM)

Computer controlled assembly and parts making are components of the larger system called Computer Aided Designing/Computer Aided Manufacturing (CAD/CAM) or Computer Integrated Manufacturing (CIM) for short. CIM has six functional areas.²⁵ (1) design; (2) storage and retrieval of information about the parts being manufactured; (3) management and control of available resources (labour, machine time and materials) according to changing demands; (4) handling of materials; (5) control of machine tools and other single-purpose machinery; and (6) control of robots. The synergetic advantages of CIM are dependent on the development of data processing technology in each of these functional areas.

Under CAD systems, the designer makes an initial estimate of the shape of a particular object, views it on the screen (visual display unit of the computer), analyses it and successfully refines it. Once he or she is satisfied with the simulated solution as seen on the screen, the computer produces a good clear drawing of it more accurately and in less time by using a suitable printer. Under this system, there is no need for a well-trained draughtsman, and costs can be much reduced.²⁶

Storage and retrieval of information about parts, whereby a precise knowledge of the location of specific items at any instant of the manufacturing process could be obtained, is organised by Group Technology or Cellular Manufacturing System. That means that parts with similar geometry and machining requirements are grouped so as to reduce re-tooling and re-setting. Also machine tools, manpower and processes are grouped to treat a specific group of parts. The highest form of this organisation is called Flexible Manufacturing System (FMS)—a combination of numerical control, robots, conveyors, automatic warehouse and computers. The computerised transport system in FMS makes quick adjustments to reflect changes in the mix of parts being machined or assembled. FMS is said to be the heart of CIM.²⁷

For optimum utilisation of available resources, a system of Manufacturing Resource Planning and Control is adopted. According to this, estimates of inputs can be made by extrapolating backward from the delivery date for the assembled product. This reduces inventory (finished or work-in-process waiting). In this connection, the Japanese 'Kamban' (or 'Just-in-time') system of reducing stocks by making available right items in right amounts in right time is famous and fairly well known. There is another, recently reported,

inventory reduction system called Optimised Production Technology. This was lately developed by the Israelite, Goldratt and used at the General Motors' plants. There are three variables in this system: throughput (the rate at which a production system generates money through sales), inventory (the money invested in raw materials), and operating expense (the money spent on turning inventory into throughput, including money spent on labour). The system maximises profits by increasing throughput and decreasing the inventory and operating expense.²⁸

The advantage of CIM is that materials handling is done by robots and any faults in CIM can be easily detected by plugging them into a computer.²⁹

The ultimate aim of CIM is to build paperless, unmanned 'flexible-make-anything' factories for assembly or parts making or for both. Designing, manufacturing, process planning, testing and inspection and information flows are all integrated by computer technology. The computerised numerical tools and robots can even be programmed to do 'ghost shifts' (night shifts) with just one or two workers to keep an eye on things. However, even such sophistication cannot do away with the essential technically qualified supervisory and maintenance personnel.³⁰

Under CIM, lead time (i.e., time taken to put a product in the market), inventory waste, number of machine tools, material content and cost, labour content and cost, machine downtime (i.e., time taken in resetting machinery specification from one size or type of product or component to another), average number of operations per part, energy consumption, total average processing time from raw-stock to finished product, and overall overhead charges, will all decline. The production system's size as a whole will shrink, that is, space efficiency will increase. Desired capacity can be built in less space with smaller building and supporting facilities. And there would be no labour management problems. Machine utilisation and product yield and quality will shoot up. The break-even point will appreciably collapse. The cost of manufacture per unit of output will fall and real rate of return on CIM will rise. Above all, CIM provides short life options and facilitates better customer service.³¹

The immense benefit from CIM will be the elimination of "60-70 per cent of the current costs of manufacturing that have nothing to do with the physical tasks involved but depend on planning, scheduling and control of the equipment and the people who operate that equipment".³² The cost of wasteful inventory is said to be about 30 per cent of the total material cost. The direct labour cost will decrease to 5-15 per cent (or even further) of total

cost.³³ The break-even point is expected to be 30-35 per cent of capacity due to CIM, instead of 65-70 per cent for conventional plants.³⁴ Finally, CIM experts foresee a time when such a system will be downsized in such a way that 'micro-factories' could be set up anywhere within a few hours notice.³⁵

To reiterate and sum up, following Blois, the overall effect of CIM (by way of flexibility in product design and product mix, rapid response to changes in market requirements, reduced work-in-progress, greater control of processes, greater predictability of maintenance requirements, distributed information processing and small minimum order quantities) is "to offer the possibility of manufacturing a variety of complex objects in batches ranging from very small to large, at a cost per unit, regardless of the batch size, which is of the order of less than that usually associated with mass production. Furthermore, the system can respond more rapidly than most manufacturing processes to changes in market demands."³⁶

IV

CIM and Production Organisation

Theoretically, CIM permits a company to internalise final assembly and parts making under a single roof; it also permits subcontracting at both domestic and international levels on the basis of technical division of labour between different, geographically dispersed plants of the same firm or of different, legally independent firms. The spatial separation between plants can be almost instantly merged with the aid of 'Information Technology' or Telematics—a mixture of electronic components, computers and telecommunications.³⁷

In reality, CIM has had a two-fold impact. There is evidence to show spatial expansion of domestic subcontracting into international subcontracting. There is also growing evidence to show spatial contraction of international subcontracting into domestic subcontracting or complete internalisation by the single-plant or multi-plant parent firms. At present there is indeed the difficulty of pointing out which of these trends is dominant.

Let us consider here the interesting proposition that computerisation is compatible with subcontracting of parts making. According to a source, since the tapes and computer programmes are highly portable, numerical control increases the possibilities for management to transfer work elsewhere in the United Kingdom or abroad. Numerical control and computerised machine tools pose a threat to the effectiveness of stopping subcontract work, transfer of work abroad and strikes. With the development of micro-electro-

nically based satellite the transfer will be further facilitated. This trend is further augmented by current research in the UK, initiated by the US Airforce to develop a computer language to 'enable all the thousands of subcontractors to aerospace to speak the same language' [*The Engineer*, November 28, 1978].³⁸

In the near future, computer language is expected to do away with the conventional way of issuing drawings or samples to a sub-contractor. Instead the geometric data and machine-tool programmes needed to shape a product would be transferred electronically to the sub-contractor's computer. Orders from major customers or to sub-contractors/suppliers will be electronically transmitted.³⁹ This way, high quality conformance of subcontract work—faithfulness with which the product manufactured by the sub-contractor conforms to the design specifications of the parent firm—could be maintained. For example, General Motors is reported to have taken a leaf out of Toyota's book, and is said to have "got its suppliers hooked into its vast computerised information net, allowing them swap data with the giant motor maker as a first step towards integrating them wholly within its CIM environment".⁴⁰ Elsewhere it was mentioned that: "In a \$40-billion plan to integrate all its manufacturing using computerised tools, sensors and data collection, General Motors has issued terminals to all its main suppliers and tied them into its own information network. Suppliers will eventually track production and deliver components to General Motors' factories as they are needed. They will also collaborate on developing new components for future models."⁴¹

CIM has become as important to small manufacturers as to big. For one thing, the sub-contractors cannot survive without it, as they face the threat of being cut off. CIM has become, or will become, affordable even by small job shops with the continually falling cost of computer power in terms of 'price per instruction per second' (PIPS).⁴² In fact, custom-made computerised production scheduling and sequencing packages for each machine or work centre have already been developed for small and medium firms in the engineering industry to make available each assembled finished product by a preset date. Apart from this, computerised systems for small firms provide them control over stocks, work-in-process monitoring, as well as capacity forecasting, that is 'whether the capacity available on each work centre needs to be adjusted in the light of the number of orders received or planned'.⁴³

Keeping with this trend, recent evidence shows that CIM is fast diffusing among small firms and that big corporations are offloading work to them on subcontract:

"Disbursement of production towards... smaller manufacturing units is progressing remorselessly... industrial boutiques run by small independent operators with all, the latest CAD-CAM techniques are emerging as contractors to mainstream corporations, many of which eventually be forced to offload their manufacturing units and buy in tailor-made products."⁴⁴

Since CIM erodes economies of large-scale in manufacturing many big corporations are likely to just concentrate on and derive scale economies in the fields of R and D, sales and marketing.⁴⁵ This contradicts the viewpoint of certain writers that micro-electronics technology will inevitably increase business concentration and recentralisation of production such that "small businesses and subcontracting arrangements are particularly vulnerable".⁴⁶ The point is that while the microelectronics-based redesigning of products eliminates much of subcontractable work by resulting in low-cost, component count,⁴⁷ there is no reason why mainstream corporations should not subcontract out small-lot assembly and parts manufacture to small and medium firms equipped with CIM or FMS. Of course, the mortality of the suppliers, using conventional technology, will rise in the process.

That CIM's diffusion has already become evenly spread among big and small firms may still be questionable at present. But we can hold for certain that various subsets of such a system (for example, FMS), have been fast emerging nonetheless, and that by the 90s, CIM would become a fairly generalised phenomenon in the highly industrialised countries due to the unprecedented speed with which prices of components, computer power and telecommunications are falling.

The spread of CIM/FMS is extremely rapid in Japan, followed by the US⁴⁸ and elsewhere. The urgency in Japan is due to "a simple an inescapable fact that the Japanese economy and Japanese companies are faced with the prospect of a workforce diminishing in size and increasing in age".⁴⁹ In the US, FMS is considered ideal for sub-contractors/suppliers. Many sub-contractors may be too small (individually) to afford CIM or FMS at the present rates or consider the switchover a risky, tantalising love affair, so to speak. But there is no reason why they should not "band together to share a flexible manufacturing centre, making spindles for washing machines one minute, wheel bearings the next, then switching to precision mounts for a microscope maker, crankshafts for diesel engines, microwave cavities for radar equipment, nosecones for missiles, and so on. This would reduce investment risk for the individual firm, while providing a higher return for the CIM plant as a whole."⁵⁰

CIM/FMS and International Subcontracting

With the economics of production changing in such a way as to make labour costs less and less important, neither cheap labour in the LDCs nor expensive labour in the DCs enters the calculus of competition. One would expect multinational corporations (MNCs) to retreat from low-wage countries and plant themselves in their home-countries or areas of market growth elsewhere. There is some evidence to support such an expectation. For example, the American giant, IBM, after switching over to CIM or finding indigenous CIM-equipped suppliers, "has brought numerous jobs, previously done offshore, back into the US".⁵¹ Or, consider the recent, fascinating story of another American company, Allen-Bradley, which found an alternative in CIM to going offshore or going out of business.⁵²

Allen-Bradley, a small company located in Milwaukee, makes industrial controls (electric motor controls used in industrial machinery). Its market share dwindled in the US due to competition from the European and Japanese counterparts who made the controls lower in price and smaller in size than Allen-Bradley's. In order not to sink, the company's top management considered three options: offshore manufacturing, joint venture or making controls similar to the rivals' under licence. But "Allen-Bradley decided against using cheap labour because it discovered that supposedly low cost manufacturing operations can be deceptive...One Mexican plant pays assembly line workers only \$1 an hour. However, because lack of automation means hiring many supporting workers such as warehousemen, total labour costs per assembly line worker run as high as \$13 an hour—only \$3 less than the rate, including benefits, of workers in Milwaukee." Instead, the executives and engineers of the company examined the production processes of the French, German and Japanese rivals and then decided to massively invest in CIM facilities. The company produced 60 per cent of automatic machinery (including programmable robots) in-house and procured 40 per cent from sub-contractors. The automated assembly line that came into existence is unique: it can turn out variegated products—simple and complex—in small lots as small as a single unit ('one-off') with unheard of speed that did away with the parts inventory problem. Its inventory management is superior to the Japanese 'just-in-time' which does not allow making lots of one at mass-production speeds. Allen-Bradley achieved the dream of the Japanese to make goods flow like water through the line.

Allen-Bradley now produces everything in-house except springs (which are sourced from a sub-contractor on a just-in-time basis) and screws and coils (which are procured on a large scale and stored until needed). Only four technicians are employed "who load the assembly machines overnight with just enough raw material and parts to take care of the next day's run". This small company now can outcompete its previous out-competitors.

Such example are not exceptional. Come to Asia's newly industrialising countries, which have been the dreamlands for MNCs since a long time. In 1984, the Japanese company, Sord Computer Corporations pushed off from Singapore and went home. Similarly, Hitachi, Fugitsu and General Motors have also moved their assembly lines back home.

The reasons:⁵³ rising labour costs and opposition, shortage of skilled technicians, conflicting governmental intervention,⁵⁴ and more importantly, cost-cutbacks in home countries due to robotics and state-of-the-art technology. For example, foreign subsidiaries in the field of consumer electronics in Hong Kong or South Korea that once relied on thousands of workers to wire radios or solder television components now find that robots—either in Asia or, more importantly, at home—can do the job just as well and less expensively. In 1980, General Motors moved its radio manufacturing out of Kokomo, Indiana to Singapore and Mexico but by 1987, the company expects to expand again in Indiana, thanks to a combination of concessions from the United Auto Workers and a revolution in computer-driven technology. The American chip maker, Motorola has established automated plants in Arizona and is no more bothered about labour costs in the US or in Asia. Honda too has robotised automobile assembly in Japan and is least bothered about labour costs. Control Data Corporation is said to have closed its 15 year old plant in South Korea in 1982 when workers striking for higher wages reportedly halted production and held American executives hostage. Other companies, including Doe Chemical, Matsushita, Pioneer and Sony contributed to the exodus. However, the source which stressed this trend in 1984 also pointed out that twelve of the world's largest disc-drive manufacturers had set up shop in Singapore and that "more are coming".

Consider traditional labour-intensive trades such as textiles and garments. These trades can now turn into hi-tech categories with high levels of R and D and computer software. There are self-programming robotic arms and laser beams for garment cutting. There are microprocessor based control systems for designing, sewing patterns, fast stitching, knitting heads and ink

injectors so as to provide variegated designs and colours. Computer control systems are also feasible for tooling, production planning, scheduling, machine control, inspection, quality control, storage and marketing. There is a view that since these technological advancements provide competitive edge, not labour costs, relocation of hitherto internationally subcontracted work must follow.⁵⁵ But what is the evidence? A source points out that relocation back to the north has not yet taken place on a significant scale and the introduction of flexible and integrated automation systems is not yet a reality for this industry.⁵⁶ Interestingly, a more recent source indicates that in some sub-processes of the garment industry trade reversal has already occurred and is likely to occur further.⁵⁷ But note that there is also clear evidence that the most labour-intensive operation, machining or sewing has been brought back home and increasingly farmed out for subcontract to cheaper home-workers (women) in the UK and Italy instead of being automated.⁵⁸

In the automobile field, trade reversal is expected in some of the parts and components presently subcontracted to the LDCs. The complete manufacturing cycle will get closer to the final markets and the logic of building 'world plants' and shipping parts across borders will be seriously undermined. For example, in the 70s General Motors set up three engine assembly plants in Austria, Australia and Brazil to meet its global needs for a new engine; its 80s strategy for the US is to have all component suppliers within 100 miles radius of its final assembly plant.⁵⁹ This contraction of international subcontracting into domestic subcontracting is attributed to the adoption of computerised 'just-in-time' type of inventory control.

Take the case of consumer electronics. It is true that automatic insertion and VLSI (very large-scale integration) components have enabled MNCs to withdraw from cheap labour peripheries. But multinationals have also transferred automatic devices and super-chip production to the peripheries.⁶⁰

Finally, let us consider chip assembly and testing in the field of components. Here the dominant trend, according to some scholars, is trade reversal due to development of automated facilities. The reason, for example: "With the manual technology of the 70s, Hong Kong production costs were 33 per cent of those in America; with the semi-automatic technology of the early 1980s, the advantage had fallen to 63 per cent; but with automated assembly lines installed in 1983, production costs in Hong Kong were marginally lower (8 per cent) than those in the US".⁶¹

Trade reversal is also attributed to the chip makers' need for closer customer/end-user contact, elimination of logistics problems, and to generous incentives and heavy investments by governments of some DCs to create jobs and develop national capabilities.

Three particular developments have been clearly noticed in the chip assembly and testing since the mid-70s: first, investments into offshore lines have been slowing down; secondly, employment in offshore locations has stagnated or might have declined; thirdly, and more importantly, value added in offshore manufacturing has been falling which is a reflection of the changing economics of semiconductor/microchip production due to automation at both onshore and offshore locations.⁶²

However, we must note that the shifts of multinationals in this field have been rather very complex to fathom. There are shifts within OECD countries. Then there are shifts between the 'centre' and 'periphery' within OECD. For example, Ireland, Scotland and Wales were reported to be emerging fast as the most important European periphery attracting the chipmakers to service the nearby huge and dynamic markets. Many or some of the existing assembly and testing facilities in the LDCs, especially in south-east Asia, are likely to continue functioning, albeit with labour displacement due to computer based automation. Already such a trend has been witnessed. This has been or will be complemented by new forms of international subcontracting related to design and wafer fabrication (silicon foundry service) so as to situate the entire manufacturing cycle within the periphery itself (for example, in south-east Asia).⁶³

Some more proof can be mustered up to show that the interest in the less developed periphery has not yet been dead. In 1983, there was an upsurge in capacity investment in offshore facilities. Besides offshore is still important to the onshore as a buffer against the extreme crisis vulnerability of the chip industry. The noted authority, Ernst adds: "Since 1982, virtually every major captive or merchant US semiconductor firm has added final test and burn-in to its offshore assembly activities. In fact, substantial amounts of money have been spent on transferring expensive automated test equipment to offshore locations. In addition, independent testing and burn-in sub-contractors in Singapore and Manila have substantially stepped up their activities. As a result, the test equipment which can be found today in Asia matches the equipment found at a US firm's domestic facilities." As regards design, "there has been a proliferation of so-called 'satellite design centres linked to new start-up companies focusing on application-

specific devices, particularly in the field of telecommunications. Such independent design centres are emerging in southeast Asia". With regard to silicon foundry service, "the 1983-84 supply crunch for key memories and microprocessors has forced leading US semiconductor firms to look for new and unconventional approaches to a world-wide sourcing of wafer fabrication. Intel, for example, has established the concept of 'die contradicting' which means that other companies use Intel masks to produce each die, which Intel then puts into a package and sells as an Intel finished product."⁶⁴

Further, relocation to the less developed periphery may or will continue because of the need to run capital equipment round the clock (7 days a week, 3 shifts a day) without any need to comply to labour or environmental regulation. An instance is Siemens' move to the less developed periphery in the 80s. Furthermore, relocation will continue to advanced or new areas of the periphery because of shortage of skilled/qualified engineers (for instance, as in the erstwhile West Germany) in industrial countries and the availability of cheap 'human capital' (engineers and technicians) in the LDCs such as India and China.

This is not all. The mobility of the multinationals is checked because it is not easy to dismantle the already entrenched international production and marketing networks. Instead of dismantling, world-wide decentralisation of automated production would be synchronised with integrated system of transborder data flows under the control of the headquarters' management of the MNC concerned.⁶⁵

It thus follows that the opinion that relocation (to the home countries of multinationals) of hitherto internationally subcontracted production must follow due to the new technologies should be taken with fairly large pinches of salt.

Notes

2 Just for instance, the shift made by the Indian Telephone Industries (ITI) in making exchange line equipment from electro-mechanical regime to electronic regime, was reported to have led to the irrelevancy and the hue and cry of its 94 ancillaries based on electro-mechanical technology; the new digital systems involved just assembly of a number of critical components (resistors, capacitors, transistors, integrated circuits, etc) and subsystems which could only be

made in relatively large volumes with semi-automatic or automated processes and strict quality control, and not in the small sector. **CENTRE FOR MULTI-DISCIPLINARY
DEVELOPMENT RESEARCH**

(ICSSR Institute)

Jubilee Circle, Dharwad, Karnataka

Applications are invited for the following fixed term posts:

Fellow: (University Reader's Scale in Karnataka)

Qualification: Good Academic Career with Ph.D. in any one of Social Sciences: special interest in human developmental issues. Research experience for not less than five years, with high standard published research work to credit.

Associate Fellow: (University Lecturer's Scale in Karnataka)

Qualification: M.A. with special interest in Human Resource Development/Public Finance. Familiarity with quantitative techniques desirable.

Age: 35 years or below.

Persons with good record and performance are likely to be absorbed against permanent posts. Qualifications and age conditions may be relaxed at the discretion of the Selection Committee. Candidates may also be considered on fixed consolidated emoluments or on deputation terms. SC/ST candidates should attach copy of their certificate in this regard.

Candidates should apply (with employer's certificate for deputation) with copies of the testimonials and two references to Director, C.M.D.R. *within 15 days* of the publication of this advertisement.

**INSTITUTE FOR SOCIAL AND
ECONOMIC CHANGE**

NAGARABHAVI PO BANGALORE 560 072

**Brief Advertisement
No. 1/18.263**

Applications are invited for the following posts (temporary) for a project of two years (up to June 1995) duration.

1. Senior Research Officer : 1 Post
2. Research Officers : 3 Posts (Posts 2, 3 & 4)

ESSENTIAL QUALIFICATION

1) **Senior Research Officer:** Masters degree in any Social Sciences with 50% marks in aggregate, Ph D. or published work of equivalent standard in the subject; five years teaching and/or research experience in the subject; publications in the subject.

2) **Research Officers:** Masters degree in Sociology/Social Anthropology (for Post 2), Mathematics/Statistics/Economics with specialisation in Econometrics (for Post 3), Mathematics/Management (for Post 4), with 50% marks in the aggregate, Three years teaching and/or research experience in the subject; and published and/or unpublished work in the subject

AGE LIMIT

Normally below 40 years for Post 1, and 35 years for Posts 2, 3 and 4; relaxable up to five years for SC/ST candidates and without any limit for employees of the Institute

SCALE OF PAY

Post 1: Rs.3700-125-4700-150-5300 (Gross at the minimum of the scale: Rs.7142.00)
Posts 2, 3 & 4 } Rs. 2200-75-2800-100-4000 (Gross at the minimum of the scale: Rs.4495.00)

A copy of the **Full Advertisement** with further details and application form can be had on request separately for each post, from the **Registrar** by sending a postal order/DD for Rs. 20/- for Post 1, Rs. 15/- for Posts 2, 3 and 4 with a self-addressed stamped (Rs. 2/-) envelope (28x11cms). Application fee is not required for SC/ST candidates, but, they should send their requisition with an attested copy of the Caste Certificate along with a self-addressed stamped envelope. Completed applications should reach the Registrar on or before 12th July 1993.

Bangalore

What is India's Privatisation Policy?

Prajapati Trivedi

The debate on privatisation in India has been more ideological than pragmatic; more dogmatic than analytical and more bureaucratic than technocratic. This study attempts to piece together various policy pronouncements and publicly available documents on this subject to outline what appears to be the prevalent approach to privatisation.

DOES India have a 'privatisation policy'? If so, what is it? The answers to these questions will depend on who is giving the answers. Typically, majority of the highly placed policy-makers in the government tend to deny the very existence of a privatisation policy. Whereas, critics and most employees of the Indian public sector see manifestations of privatisation policy everywhere. The only thing common between these two groups is that neither has a really clear picture of the overall privatisation policy.

The debate on the privatisation policy merely assumes the existence of such a policy. Most writers take one aspect of this policy and examine it under a magnifying glass. Unfortunately, this kind of scrutiny is not very useful because it ignores the big picture. The linkages between policies are very important in analysing the effectiveness of individual policies. For example, one cannot fully debate the merits of the 'disinvestment' policy, 'Memorandum of Understanding (MOU)' and the policy of 'restructuring sick public sector undertakings (PSUs)' without knowing how they fit the big picture.

The entire blame for this low level of debate on privatisation cannot be put at the doorstep of the critics alone. By tolerating an absence of a written statement on the privatisation policy, the government has not helped the cause of promoting a better understanding of its public enterprise policy, to put it mildly. The fact of the matter is that the seemingly contradictory statements emerging from the highest echelons of policy-makers has made it impossible for most people to believe in the existence of a coherent privatisation policy.

The purpose of this article is to piece together various policy pronouncements and publicly available documents on this subject to outline what appears to be India's approach to the issue of privatisation. This article neither criticises the policy nor tries to defend it. Rather, the goal is to understand the broad contours of India's public enterprise policy.

As mentioned earlier, there is no written policy statement but the government's actions imply the existence of a definite pattern. This implicit privatisation policy in India appears to have three elements. They are like the three legs of a delicately

balanced three-legged table and determine the stability and success of the entire policy.

I

Avoiding the 'P' Word

The most confusing aspect of India's privatisation policy is the absence of an agreed name for it. Different people refer to it in different ways. In fact, the entire policy is usually given the name which is appropriate for describing only one aspect of the entire policy. For example, often 'Disinvestment of PSUs' 'Closure of sick PSUs' or 'liberalisation' are used as name tags for the whole policy.

However, if you look at the policy closely, you can see the reasons why the term 'privatisation policy' has never been used in the Indian context. First, the term 'privatisation' encompasses a large arena. Any rolling back of the government's involvement in economy can be called privatisation. Therefore, using the term privatisation can create all kinds of imaginary anxieties. Second, the most common connotation of the word privatisation is selling public assets—like the sale of British Telecom in Britain. This option involving the sale of assets was clearly not at the forefront of the Indian government's implicit privatisation plan. At least, the government did not want to create the impression of emphasising the sale of public assets as a foundation for its policy toward public enterprises. Therefore, it eschewed the use of the term privatisation to describe its efforts in this area.

Finally, without question, privatisation is an ideologically loaded word and in a poor country like ours, an unpalatable word. As my friend Paul Rosentien-Rodan used to remind me constantly: "As long as the majority of the people are poor, their ideology shall prevail." This implies that in a poor country the sale of public assets does not have the same impact as it does in a developed economy like that of Britain. In India, any privatisation is likely to create new owners only among the relatively rich sections of the society. Thus, the vast majority of the poor are likely to view any transfer of ownership of assets with scepticism.

For all these reasons the government seems to have hesitated in using the term privatisation. This has had two consequences. First, it has disarmed the government's critics and prevented the government from wasting time in defending its rhetoric. The Indian government went ahead quietly with disinvestment and other policies which fall under the general category of privatisation but never called this process a privatisation effort. This strategy allowed the government to successfully focus on individual aspects, which are very difficult to implement under the best of circumstances and do not need to be further complicated by a rhetorical match. In retrospect, this strategy appears to have been a wise idea for facilitating the implementation.

Second, lack of agreement on the meaning and scope of the word privatisation had led to conflicting pronouncements by some top policy-makers on this subject. On many occasions, some of them have said that India is ready for privatisation or is going ahead with privatisation. Why did they use the 'P' word when others in the government were carefully avoiding it? One can think of two reasons. First, while other words could indeed be substituted for the term 'privatisation' as far as the discussion in India was concerned, the international donors and investors wanted to hear the 'P' word. In the prevailing international milieu, to talk of the 'reform' of the public sector is considered as a reaffirmation of the *status quo*. Therefore, those policy-makers who are under pressure to placate the international community and attract additional investment tend to use the 'P' word mainly more as a marketing tool rather than a serious statement of policy. In addition, since there is no explicit agreement on not using the 'P' word, many policy-makers who are on the periphery of power interpreted the actions of the government as a tacit approval of privatisation as a public policy and saw no reason not to call spade a spade.

II

Privatisation Matrix

It is one of the axioms of public policy that the more open and transparent you make it, the less interesting it gets. In

December 1991, the government of India placed a document on the table of the parliament outlining the government's thinking in the area of public enterprise policy. This document was entitled *Monograph on the Performance Status of Central Public Sector Enterprises* (referred to as Monograph hereafter) and was prepared by the department of public enterprises, government of India. It is a unique document of great historical importance. No body can fully participate in the debate on the privatisation policy in India without understanding and appreciating the thinking behind this document. Unfortunately, however, this document has thus far not become part of the privatisation debate in our country. This section is, perhaps, the first attempt to unravel the logic of this crucial document.

To understand the policy behind this document, we need to understand the implicit conceptual framework. The root cause for the interest in the privatisation option is the perceived inefficiency of public enterprises. For better or worse, the efficiency of public enterprises is usually measured with the help of financial profitability. Some people have condemned the public sector as inefficient because its profitability is lower compared to that of the private sector. This indictment often provides fuel for privatisation.

However, such broad sweeping generalisations about public enterprises usually leads to a great deal of controversy and debate. The public sector protagonists argue that these figures are too aggregative and for correct interpretation these figures ought to exclude those sick enterprises which were acquired from the private sector. Their adversaries also argue that these figures are too aggregative but they suggest that these figures ought to exclude the profitable oil sector. The result of these arguments has been a debating match which has stood drawn out for ever. Both sides have claimed victory and seem to have left the lay person totally confused. Unfortunately, this confusion has also stymied efforts to effectively deal with the losses in the public sector. Most public policy prescriptions seem to be influenced by one group or the other. Those who believe that financial returns from public sector are poor tend to go all out for privatisation. Others find redeeming value in the public sector in spite of the poor financial returns and defend its continued existence as such. In short, the debate on privatisation has been more ideological than pragmatic; more dogmatic than analytical and more bureaucratic than technocratic.

To move away from the ideological approach one has to begin by a closer examination of the nature of losses in the

public sector. If one were to suggest that the public sector in India consists of a wide variety of public enterprises, it would be considered a self-evident proposition and hence, a redundant statement. Yet, most people seem to ignore the fact that the various losses associated with the public enterprises are also quite different from each other. If the objective of the public policy is to find a solution to these varied losses, then it is imperative that we have a clear understanding of the various losses. Otherwise, we may prescribe a single medicine to cure many different types of ailments and thus may not succeed in our ultimate goal of greater resource mobilisation from the public sector. The main objective of the Monograph is to provide a disaggregative picture of the Indian public sector. To do this it develops a very useful taxonomy of public enterprise losses. Unfortunately, the Monograph fails to elaborate the taxonomy and this may explain why it has not played an important role in the privatisation debate in our country. In the rest of this section we will make an attempt to understand the rationale behind the taxonomy presented in this Monograph. Our discussion will be divided into two parts. First we examine the theoretical framework that seems to have formed the backbone for this policy and then look at its empirical counterpart.

The Monograph starts by presenting the broad profile of the Indian public sector as reproduced in Table I. It then finds the classification of public enterprises between profit-making and loss-making categories too broad for a meaningful policy discussion. Therefore, it goes on to suggest that the losses in the public sector may be classified along four dimensions. In what follows we first examine each of these dimensions separately and then put them together to shed light on the nature of the real problem and options outlined in the Monograph.

To start with, one has to distinguish between the losses that are being made by

public enterprises in competitive industries versus losses of those in the non-competitive (monopolistic) industries. The distinction is straightforward and requires no further elaboration.

Transparency

At the broadest possible level, public enterprise losses can also be divided into two categories—explicit losses and implicit losses.

(a) Explicit losses: They show up as such in the financial statements of public enterprises and imply that the public enterprise is draining the resources at the disposal of the national exchequer.

(b) Implicit losses: These losses do not show up in the financial statements of an enterprise. They represent the difference between the 'potential' profits versus the 'actual' profits. In other words, a profitable public enterprise may be incurring implicit losses because it is not delivering profits at its potential level. Just because an enterprise is making profits, the questions regarding its true potential are often ignored. However, from the point of view of the national exchequer, a rupee lost as an explicit loss is the same as a rupee lost as an implicit loss.

The total explicit loss incurred by the public sector for the year 1988-89 was Rs 1906.51 crore. This should be compared with the possibility of having additional resources worth of Rs 4218.42 crore, even if a modest improvement of 5 per cent in the efficiency in the public enterprise were to take place. The latter figure represents the implicit loss mentioned above. Clearly, no public policy can afford to ignore this category of implicit losses and focus only on the more easily understood explicit losses.

Legitimacy

The other dimension which can be used for classifying losses concerns the 'degree of legitimacy' of losses. The public sector losses in this respect can be classified in-

TABLE I: FINANCIAL PERFORMANCE OF CENTRAL PUBLIC ENTERPRISES

Group	Number of Enterprises	Capital Employed (Rs Crore)	Net Profit/Loss during 1989-90 (Rs Crore)	Ratio of Net Profit to Capital Employed (Per Cent)	Number of Employees (000s)
Profit-making	131	72130 (85.5)	5740.8	8.0	1431.0 (64.4)
Loss-making	98	12210.9 (14.5)	-1959.1	-16.1	790.5 (35.6)
Grand Total	229	84341.0 (100)	3781.7	4.5	2221.5 (100.0)

Note: The figures in brackets represent percentages to the total.

		Competitive	Non Competitive	Non Competitive	Competitive				
		Degree of Competition							

Dimension 1

to two categories—legitimate losses and illegitimate losses

(a) Legitimate losses These can be directly attributed to social (non-commercial) objectives that are being served by a public enterprise. For example, some portion of the losses of the Delhi Transport Corporation (DTC) arise due to a lower price being charged for the tickets and, therefore, they would fall under this category

(b) Illegitimate losses These losses arise purely due to inefficiencies of the public enterprise. Hence, their existence is not justified. More often than not, people club these illegitimate losses with the legitimate ones to justify their poor performance

Turnaround Potential

(a) Reversible losses (i.e., where turnaround is possible—TP). These losses are said to exist where it is possible to eliminate them by either improving efficiency or by choosing another instrument of public policy other than public enterprise to deal with the root cause of the losses

(b) Irreversible losses (i.e., where turnaround is impossible—TI). These are cases

where it is difficult to change the present status and hence, these losses are likely to continue as long as the enterprise remains in the public sector

The losses that exist in the real world are a combination of these four major dimensions. If we put all these dimensions together, as we have done in Figure 1, we get 16 cells. All public enterprises, not only in India but anywhere in the world, can be put into one of these 16 cells, where each cell represents a very different category of public enterprise. It is clear that

TABLE 2 TAXONOMY OF ALL CENTRAL PUBLIC ENTERPRISES

Cells in Privatisation Matrix	Market Structure	Profit/Loss	Social Obligations and Externalities	Number of Public Enterprises
1 Cells 3 and 7	Monopoly	Profit	High	50
2 Cells 11 and 15	Monopoly	Profit	Low	5
3 Cells 4 and 8	Competitive	Profit	High	15
4 Cells 12 and 16	Competitive	Profit	Low	61
5 Cells 2 and 6	Monopoly	Loss	High	13
6 Cells 10 and 14	Monopoly	Loss	Low	2
7 Cells 1 and 5	Competitive	Loss	High	6
8 Cells 9 and 13	Competitive	Loss	Low	77

to improve the performance of enterprises in different cells different kinds of policy prescriptions would be required.

Data

The strength of the Monograph lies in the fact that it has evaluated all 244 central public enterprises on the four dimensions discussed in the previous section. Those of us who have done empirical research, as opposed to merely doing theoretical work, appreciate the challenges of finding empirical counterparts to the theoretical constructs. The Monograph, however, manages to overcome these challenges in a pragmatic way.

Tables 2 and 3 reproduce the data presented in the Monograph with minor modifications. Together, these tables provide the number of public enterprises that belong to each cell of the privatisation matrix in Figure 1. However, two things should be noted about the way the Monograph defines the four dimensions for empirical analysis. First, the implicit loss-makers are defined as those public enterprises which are making profits but the Ratio of Net Profit to Capital Employed is below 8 per cent. Clearly, this is neither the only way to define implicit loss-makers nor the best way to do so. Yet it is a prac-

TABLE 3 TAXONOMY OF PROFIT MAKING PUBLIC ENTERPRISES

Ratio of Net Profit to Capital Employed	Net Profit 1989-90 (Rs Crore)	No of Public Enterprises
Above 20 per cent	1316	16
Between 12 per cent and 20 per cent	2021	16
Between 8 per cent and 12 per cent	444	15
Between 5 per cent and 8 per cent	1256	24
Below 5 per cent	704	60

tical and feasible definition which one can accept till it is improved upon. In addition, the Monograph uses the term 'social obligations and externalities' as a proxy for 'legitimate causes for losses'. This is a better term for depicting the third dimension of the privatisation matrix which distinguishes between the legitimate versus illegitimate reasons for losses. Finally, it is worth noting that the Monograph does not deal explicitly with the fourth dimension of the privatisation matrix. It lists all the 77 public enterprises that belong to cell numbers 9 and 13, that is those enterprises that are operating in the competitive sector, are making explicit losses and whose losses are illegitimate (low social obligations). In addition to listing them in the Monograph, a brief SWOT (strength, weakness, opportunities and threats) analysis is done for each of the 77 enterprises. Whether they can be turned around or not is left to the decision of the Bureau of Industrial and Financial Restructuring (BIFR) and the parliament. For those enterprises in these cells that cannot be turned around, privatisation, closure or sale of assets may be the only options but they certainly cannot be a panacea for all the problems of public enterprises.

This is precisely what John Kenneth Galbraith had in mind when he made the following comment in a recent article.

There is no overriding rule as to privatisation by which anyone or any country should be guided. There is no substitute for careful case-by-case thought, painful as that may be. Far easier is the oratory laying down broad, if sadly unpalatable, principles. Some have spoken of a broad, transforming move to private enterprise. I am hopeful and indeed optimistic enough to believe that it instead will be a thoughtful adjustment to a particular circumstance.

While a full-fledged discussion of each of the 16 categories in the privatisation matrix is beyond the scope of this paper and deserves a separate treatment, some comments on the case-by-case approach may be illuminating for policy-makers and sobering for ideologues on both sides of the privatisation debates. (Table 4 gives examples of public enterprises belonging to the different cells of the privatisation matrix.)

If one had to arrange each of the 16 cells in Figure 1 in an ascending order of difficulty involved in the privatisation of enterprises, one would find cell number 13 at the top of this list. Even the most diehard supporters of the public enterprise concept would agree that enterprises belonging to cell number 13 ought to be the first ones to be put on the chopping block. The enterprises in this cell are those that are making explicit losses, cannot be

turned around in the public sector, have no social objectives to justify some of their losses and they are in a competitive industry. Perhaps, the Cycle Corporation of India and National Textile Corporation might fall under this category.

On the other hand, cell number 4 represents a much tougher case. Enterprises belonging to this cell are monopolistic, making explicit profits but implicit losses, some of these losses are for legitimate social objectives but the performance of these enterprises can be turned around while they continue to remain in the public sector. Oil and Natural Gas Commission (ONGC) may be a good example of this category. It has hardly any competition, it makes explicit profits but one cannot argue that ONGC has exhausted all avenues for cost economies. Certainly, many of its objectives are non-commercial in nature. For examples, it runs a large number of research centres and borrows funds on behalf of the government in the international market, to name just two of them. Finally there is no reason why ONGC cannot improve its performance while remaining in the public sector. Given these facts, it is not clear that an enterprise like ONGC ought to be privatised in a hurry.

Another generalisation that emerges

out of this matrix relates to the fact that, except, perhaps, for cell 13, a good performance evaluation exercise will have to be a necessary precursor to the design of appropriate policy response for enterprises in all other cells. It is only after such an exercise, that real costs and benefits of various alternatives will become transparent.

Further, to find out whether privatisation has yielded the expected benefits, one must have an evaluation methodology in place. Only in cases where the sole objective of privatisation is increased financial profits without concern for any other trade offs, we need not worry about any other evaluation methodology but the conventional accounting profits. However, any reasonable observer of privatisation trends would agree that very few countries have gone for privatisation that would only promote unbridled profiteering.

Any privatisation effort without a proper *ex-ante* evaluation methodology may be termed a 'blind' privatisation. Because, after the privatisation the government will have no clue regarding the real impact of privatisation. It is little wonder that not a single rigorous study of the impact of a major privatisation effort exists. Most of the evidence in regard to the impact of privatisation is anecdotal.

TABLE 4: TAXONOMY OF CENTRAL PUBLIC ENTERPRISES

Cells in Privatisation Matrix	Market Structure	Profit/Loss	Social Obligations and Externalities	Representative Sample of Enterprises
1 Cells 3 and 7	Monopoly	Profit	High	Coal India; Indian Oil Corporation; National Airports Authority; Videsh Sanchar Nigam
2 Cells 11 and 15	Monopoly	Profit	Low	Container Corporation of India; Indian Telephone Industries; Mica Trading Corporation of India.
3 Cells 4 and 8	Competitive	Profit	High	Bharat Dynamics; Hindustan Latex; Bharat Electronics; Shipping Corporation of India.
4 Cells 12 and 16	Competitive	Profit	Low	Air India; Balmer Lawrie and Co; CMC; Hindustan Teleprinters; HMT.
5 Cells 2 and 6	Monopoly	Loss	High	Delhi Transport Corporation; Food Corporation of India; Cochin Shipyard.
6 Cells 10 and 14	Monopoly	Loss	Low	Bharat Gold Mines; Vayudoot.
7 Cells 1 and 5	Competitive	Loss	High	Artificial Limbs Manufacturing Corp; National Seeds Corp; Central Inland Water Transport Corporation.
8 Cells 9 and 13	Competitive	Loss	Low	Cycle Corporation of India; National Textile Corporation (Gujarat); Mining and Allied Machinery Corporation

Source: Monograph on the Performance Status of Central Public Sector Enterprises - Department of Public Enterprises, Government of India, December 1991.

Even in terms of sequencing, enterprises in cell number 13 ought to be disposed of first. In all probability, they are likely to be smaller enterprises which will be easier to handle technically as well as politically.

Nigel Adam, former editor of London-based monthly *Business*, recently summarised the general perception when he said:

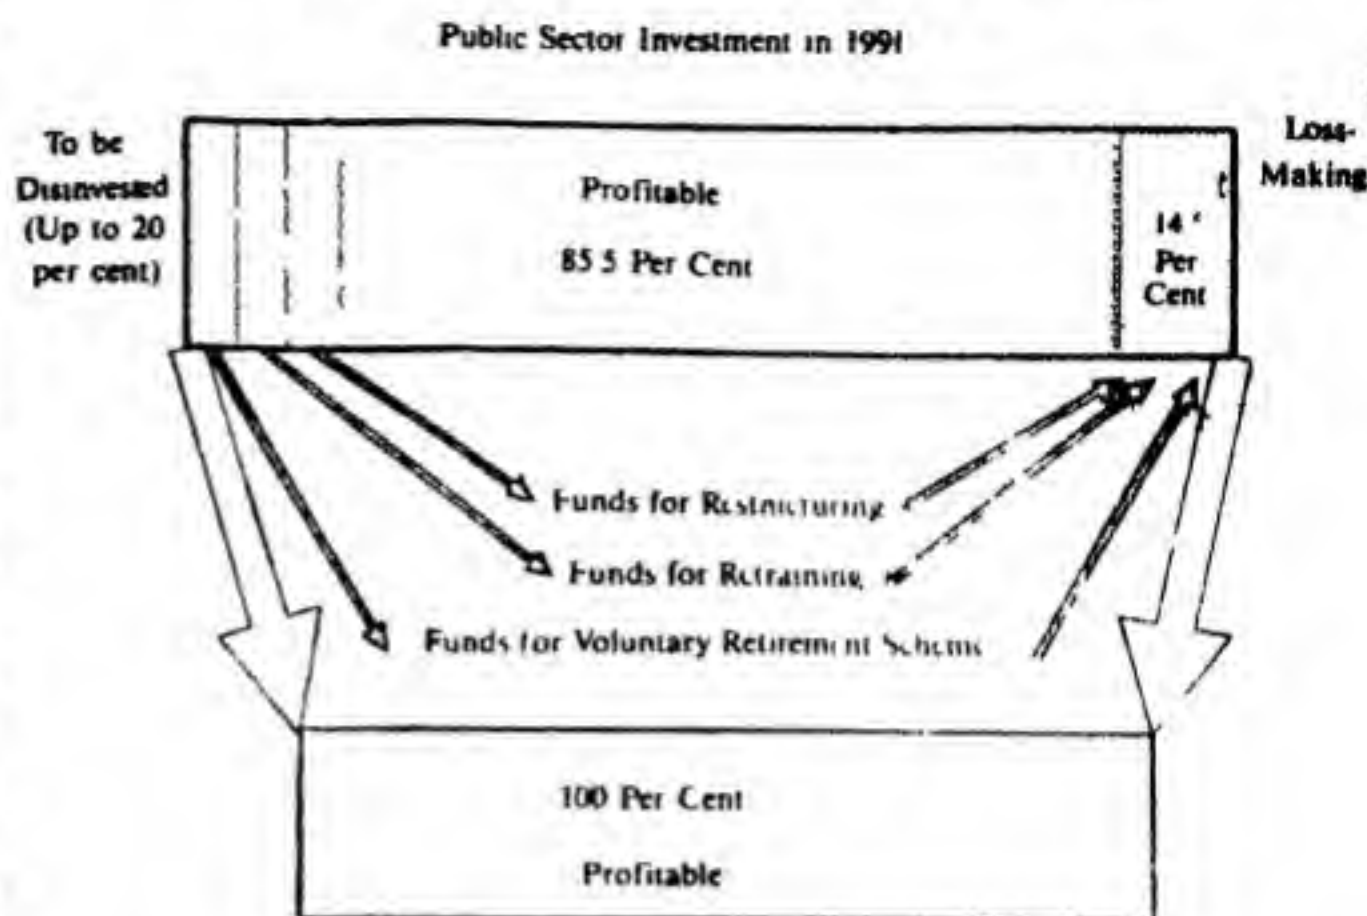

The jury is still out on the success of the UK privatisation experiment. The big utilities like British Gas and British Telecom have generated respectable profits since becoming privatised but this is largely because they still hold monopolies in their markets. Telecom has improved its services, but the industry regulator appointed by the government to keep an eye on standards, believes that services and prices could be even more favourable to the consumer.

It is to eliminate such confusion after the fact that one needs to have a performance evaluation system in place before privatisation. The current policy of memorandum of understanding (MOU) in India is precisely such a system. It has led to an intensive case-by-case discussion on the performance determinants for those enterprises covered by such a system. It is only through such a rigorous exercise that one will be able to properly categorise enterprises into the 16 cells of the privatisation matrix. It is in this sense that a system like MOU is both a necessary pre-condition as well as a complementary policy for a successful and pragmatic privatisation effort in any country.

Finally, it is only sound common sense to spruce up one's wares before hawking them off. Do not we clean up and paint our house before selling? Do not we wash our car before showing it to prospective buyers? Then, why not spruce up the performance of public enterprises before privatising them. This way, we will get a much better price. The only question is how to improve the performance of public enterprises before privatising them. To get the answer, let me again quote at length from the most recent writings of John Kenneth Galbraith, the distinguished economist who predicted the convergence of capitalism and socialism way before it became fashionable to do so.

The disaster of public ownership in much of Latin America, as also in the case of older industry in Europe and elsewhere, is that performance is irrelevant or largely so. There is indication that if a corporation is large enough, it does not matter who is the ultimate owner of its shares. It can be owned by the government or, with little difference, by scattered and anonymous investors. What matters is that the management of enterprise have full right of decision and be fully accountable for performance.

FIGURE 2: LOGIC OF DISINVESTING PUBLIC ENTERPRISE SHARES

It is for this reason that the new Industrial Policy Resolution of 1991 declares that all public enterprises in India except for the ones that are being referred to BIFR will sign a MOU with the government. The objective of the MOU policy is to give managers complete autonomy for day-to-day operations but hold them accountable for results at the end of the year for performance. This point is also stressed by the Monograph which implies that the MOU policy and policy of 're-organising and restructuring' of 77 public enterprises are complementary strategies.

III

Disinvestment Policy

In the previous two sections we have explored the rationale for the policy towards the 77 chronically sick public enterprises and the MOU policy. In this section we will try to explore the possible rationale for the 'disinvestment' policy and its interrelationship with the other two policies.

Contrary to popular perception, the majority of investment in the public sector yields a positive rate of return. In fact 85.5 per cent of the Rs 99,315 crore invested in the central government owned public enterprises yields a positive rate of return and only 14.5 per cent of the investment is loss making. Most of the 77 enterprises identified for reference to BIFR account for this 14.5 per cent loss making investment.

The overall objective of the disinvestment policy is to raise resources from within the public sector for meeting the

following three categories of costs associated with transforming the Indian public sector. First, a part of these resources will be used to pay for the costs associated with the closure of enterprises declared as terminally sick by BIFR. These costs would primarily include expenses relating to voluntary retirement schemes.

Second, another part of the revenues would be used for restructuring those enterprises which are on the verge of becoming chronically sick but are as yet not beyond redemption. These enterprises will be given extra infusion of capital after insuring that a management accountability system based on MOUs is in place. Without the MOU system being in place, there is risk that these enterprises may not make the most effective use of the additional resources given to them.

Finally, a big part of the money raised from disinvestment will be used for retraining of the workers displaced or affected as a result of the closure and internal restructuring involving downsizing.

While it is fair to say that the major goal of disinvesting up to 20 per cent of PSU shares is resource mobilisation, there is bound to be some positive impact on accountability of public enterprises as well. Once the shares of the public enterprises are quoted in the stock market, these enterprises will be under increased scrutiny from a commercial perspective. In addition, there is also the possibility of using prices of the shares as one of the indicators in the MOUs for these enterprises. Ultimately, the hope of the top policy makers appears to be that in about

five to seven years, the entire portfolio of the central government public enterprises would consist of healthy, viable enterprises which would be symbol of pride and achievement and not a symbol of ridicule. Figure 2 shows how the current portfolio containing 85.5 per cent profitable and 14.5 per cent unprofitable enterprises is sought to be transformed into a healthy portfolio of financially sound public enterprises by using funds generated from within the public sector—via disinvestment or surplus generation on current operations.

CONCLUDING COMMENTS

Our attempt to discover India's policy towards privatisation leads us to the following conclusions:

(1) In India the emphasis is on improving the performance of public enterprises. Privatisation in the conventional sense of the word is only one of the many options and the preference continues to be to treat it as a policy of last resort. Which is a big progress compared to a few years back when the 'P' word was unthinkable not only in public but also in private.

(2) If the performance of the public enterprises under the central government enterprises can be improved by installing a management accountability system through MOUs, then those enterprises will continue to exist within the public sector.

(3) For those sick enterprises which are in the competitive sector, with no social objective and very little hope of being turned around, closure or sale of assets will be considered as an option of the last resort.

(4) For those enterprises which are on the margin, i.e., they are drifting toward sickness but are not beyond redemption, efforts will be made to nurse them back to health by restructuring them.

(5) There will be a massive requirement of resources to accomplish these tasks and these resources will be raised from within the public sector by disinvesting up to 20 per cent of shares in the healthy public enterprises. Disinvestment will not only support the pruning and restructuring of the public sector but will contribute toward increased accountability of existing public enterprises.

Note

The author is grateful to Alfred Schipke for helpful comments on an earlier draft. Conclusions are based on information available till June 1992 and the author alone is responsible for any errors of omission or commission.]

Poverty and Income Distribution

Edited by

K S Krishnaswamy

While there has been, over the years, a perceptible increase in per capita income and expenditure and possibly some decline in the incidence of poverty in India, what still remains is massive and of a kind that is not remedied quickly or smoothly. Even with radical policies, the shifts in income and occupational structures to make a serious dent on it will take more than the rest of this century. In the welter of recent exchanges between the government and the opposition as well as between planners and market advocates on the strategy of growth, these issues, have been largely obfuscated. It is therefore more than ever necessary today to recognise the magnitude of the problem and the inadequacy of the measures adopted so far to deal with it.

Test-Marketing of New Products in Rural Areas

Rajendra K Aneja

Rural areas exhibit sharper and varied regional preferences with distinct predilections, habit patterns and behavioural characteristics. A company has to assimilate these regional and local variations in the marketing-mix of a new product.

This paper explores the possibilities of gauging the potential of rural markets through conducting test-markets.

RURAL markets are now contributing 30-50 per cent of the sales of a number of consumer products like soaps, detergents, washing powders, safety razor blades, batteries, torches, etc. Sales of other products like toothpastes, hair oils, talcum powders, milkfoods and beverages are also increasing. Rural markets are expected to grow at a faster rate than urban markets, in a number of product areas like toiletries, cosmetics, household convenience products, etc.

Marketers have hitherto tested products in the cities only, since the bulk of the sales were generated in the urban areas. Most companies do not conduct test-markets in the villages. Their approach can best be described as 'sink or swim'. If the product sells well in the rural areas, the company continues to distribute it. If the product does not pick up volumes in the rural areas, it is withdrawn and forgotten. Very few companies try to get formal feedback about the success or failure of products in the rural areas. With the rural markets emerging as a major segment, marketers will have to test-market their products in the villages also. The product and the marketing plan have to be tested out in a small number of villages, selected for their allround representation of the reactions of rural consumers. The objective of marketers would be to set up small prototypal 'laboratories' of clusters of villages. These pilot studies would provide some comprehension of the rationale for a rural buyer behaving in certain ways. The results of the test-markets would also provide a quantitative basis for extrapolating the broadscale market before launching a brand in all the rural areas.

ADVANTAGES OF RURAL TEST-MARKETS

Test-marketing of products in the villages has a number of advantages. It helps the company to fine tune the product, the marketing inputs and the communications programme, so as to ensure high trial rates and quick acceptance among rural consumers.

Corroborate Marketing Package: Test-marketing helps the company to gauge the reactions of the rural consumers, to the entire marketing package, i.e., product features and packaging, quality and formulation of the product, pricing of different packs, advertising message, credibility of the product promise or claim, reach of different advertising media in the villages, etc. Based on the feedback from rural consumers about the product mix, a company is in a position to refashion certain features of the

marketing-mix before launching the product in all the rural markets.

Estimate Levels of Sales: Test-marketing of products in the rural areas helps a company to determine the level of sales volumes it can achieve in the villages, given certain marketing inputs and investments. Different clusters of villages can be selected to test varying levels of promotional inputs. The company can then ascertain the optimum marketing-mix and promotion package, before launching a new product nationally. Moreover, the company can actually check how many consumers 'really buy' the product, as against 'intending to buy it'.

Understand Regional Variations: All consumers, irrespective of the fact whether they live in the urban or the rural areas, essentially want a quality product at a reasonable price. However, the concept of 'quality' and 'reasonable price' varies from person to person, and from region to region. Test-marketing of products in the villages also helps to comprehend possible regional variations in consumer reactions. This can help a company to harmonise its marketing inputs to different regions, depending on specific local characteristics.

It needs to be underscored that there are noteworthy dissimilarities in the use and preferences of consumer products even in the urban areas. In the rural areas, regional preferences are sharper and varied. There are very distinct predilections, habit-patterns and behavioural characteristics in the rural areas, even within a political state. In fact, there are cogent deflections between each district, and even between various clusters of villages. These regional dissimilarities have a vital impact on the types of consumer products used in the villages. A company has to assimilate these regional and local variations in the marketing-mix of the new product. For instance, company 'X' is launching a new brand of cooking oil in the villages. As a part of the promotional plan, it proposes to distribute free snacks at the village tea shops. If the promotion is to be run in a village in Uttar Pradesh, the company will have to fry and distribute 'samosas', since they are popular in the state. However, if the promotion is to be conducted in Madhya Pradesh, the company will have to fry and distribute 'kachoris'. If the company tries to distribute the same snack in both the states, the promotion will not be successful. Regional preferences in taste, smell, colour, etc., have to be infused into the marketing plan.

Resilience of Distribution Apparatus: The wholesale trade plays a crucial role in

carrying products from the cities and smaller towns to the feeder markets. Rural wholesalers visit these feeder markets every fortnight to make their purchases. It is imperative for a new product to get quick acceptance and mobility in the wholesale channels, if it is to be widely distributed in the rural markets. Parle's Gluco biscuits are stocked and distributed widely by rural wholesalers. This ensures the widespread geographical distribution of Parle's biscuits in the villages. A test-market also helps the company to determine the reactions of the wholesalers to the new product. If the wholesale channel accepts the product, the company will have to introduce promotions to motivate the wholesalers to buy more stocks. However, if the product does not seem to be a 'wholesale' brand, the company will have to consider evolving its distribution apparatus to deliver the product directly to the rural retailer or consumer.

Evaluate Packaging Problems: Test-marketing a product in the villages provides worthy feedback about the robustness of the product to withstand transshipment and transportation by different modes, i.e., by railway wagons, lorries, vans, etc. The distribution chain from the factory to a rural consumer comprises of 4-5 links. Stocks move through a chain consisting of a company depot, an agent of the company, an urban wholesaler, a rural wholesaler and finally a rural retailer. The container and outer packaging of the product should withstand transit handling and transshipment. Goods are generally loaded and unloaded 3-4 times from the factory onwards till they reach the rural consumer. If a company is selling products like a 'tetra-pack' drink, a test-market will help to determine whether the pack can stand repeated handling.

MANAGERIAL ISSUES

The conceptual and operational issues involved in a rural test-market, are different than the ones encountered in urban markets. A series of subjects like the number and location of villages in which the test-market is to be conducted, timing and duration of the test-market, obtaining accurate feedback, etc., have to be thought through rigorously.

Planning the Test-Market: A rural test-market poses major problems in terms of logistics, synchronisation of all activities and marketing inputs. The details of the test-market should be itemised in an exhaustive written brief. The brief should also incorporate the performance parameters for evaluating the success of the new product in

the test-market villages. The advantage of preparing a copious written brief on the test-market is that all the sequences are thought through and planned for in advance.

Conducting the Test-Market The company has to decide whether it will conduct the test-market on its own, or it will commission a third-party like a market research agency, to conduct the test-market. Most research agencies in India do not undertake the entire test-market assignment, even in urban areas. Companies therefore, usually conduct test-markets on their own.

Research agencies can provide professional help in the evaluation and interpretation of the test-market. There is a clear business opportunity for market research agencies, to specialise in conducting rural test-markets.

Selection of Villages The most critical decision in conducting the test market in the rural areas is the selection of villages. This is an arduous task, due to the wide variations that exist between different regions and among the villages. Each village can be stratified on the basis of a variety of parameters like income, quantum of land-holding, crops grown (cash or coarse), education-level, caste, etc. The marketer has to find a cluster of villages, which are representative of the 5,78,000 villages in the country. The selection of the villages will depend on two vital variables.

(a) The type of product, i.e. is it a popular product or a premium product, aimed at the upper income segment of rural consumers.

(b) The distribution pattern of the product, i.e. is the product to be marketed in certain geographical region or nationally. The villages selected for the test market, must be in the geographical region in which the product is to be eventually launched. If a product is to be launched in north India only, then the test-market should be in villages in the northern states like UP, Punjab or Rajasthan.

No single village or cluster of villages can be universally representative of all the villages in the country irrespective of the criteria used to select the villages. However, it is possible to segregate villages which are broadly representative of the region and the country. A typical village would have to meet some broad criteria.

(a) The village should have a relatively good cross section of various castes, like the 'brahmins', 'kshatriyas', 'vaishyas' and 'shudras' (This criteria may seem retrograde, but castes do exist and govern life in the villages, and the marketer cannot ignore this phenomenon).

(b) About 10 per cent of the population should be affluent farmers, about 30 per cent small landholders, about 50 per cent agricultural and unskilled labour and the balance 10 per cent petty shopkeepers, retailers and village artisans.

(c) There should be at least 5-10 retail shops in the village, of which half would be grocers.

(d) The level of literacy in the village should range between 50-60 per cent among men and 30-39 per cent among women.

(e) About 5 per cent of the households possess TV sets, and about 60-70 per cent own radios or transistors.

The type and characteristics of the product to be tested, will have a determining influence in the selection of the villages. For instance, if a new brand of coconut cooking oil is to be test-marketed, it should be conducted in Kerala, where coconut oil is used as a cooking medium. If a new brand of pressure cooker is to be test-marketed, there would be no point in selecting markets with a population of less than 25,000. Similarly, if a new electric iron is to be test-marketed, at least 70-80 per cent of the households in the village must have electricity.

Duration of the Test-Market The test market for a product could last from two months to about 18 months. The duration of the test-market would depend on the average repurchase cycle, the competitive reactions and the costs of administering the test market. Products which have a short repurchase cycle can have test-markets of a shorter duration. For instance, a match box is normally purchased after every 8-10 days. A test market for a match box could therefore last for about 2-3 months. Razor blades are normally bought after a gap of about 10-15 days. A test-market for razor blades could run for about 3-4 months. Batteries for torches and transistors, are normally replaced after 6-8 weeks. A test-market for batteries would have to be run for about 8-10 months.

Competition reaction also determines the length of the test-market in the rural areas. If a test-market is run for six to nine months, the competitors are bound to get wind of it. They can start monitoring the results of the test market, and develop their own counter-strategy products, to be launched in the rural areas. The danger of competitors monitoring the results of a test market in the rural areas, however, is rather limited. Most companies do not even undertake basic test-markets of their products in the rural areas. They would not, thus just be in a position to initiate quick counter measures.

Test-markets are extremely expensive depending on the type and quantum of marketing and promotional inputs. A test market for a new brand of cattle-feed would necessitate extensive trials on individual buffaloes, farmers' education meetings, intensive investments in manpower to monitor the trials, conduct the meetings and collate the results. It would also require expenditure on wall-paintings, and perhaps even press or television advertising. A company cannot sustain such expenditure indefinitely. Its ability to invest in a test-market is also tempered by the expected level of sales volume and profit margins, after the full-scale launch.

There is an opportunity cost in delaying the launch of a product till the test-market is complete. In addition, the company has

to incur the additional expenditure of supervising the operation and monitoring the results of the test-market.

Timing of the Test-Market: The timing of the test-market in the rural markets has a significant influence on the results. It is, therefore, important to select the timing of the test-market very judiciously. A test-market for premium and expensive product should always be conducted in the post-rabi or kharif harvest period, when the farmer has money to spend. Therefore, the ideal months for a test-market of a premium product are March-April or October-November. A daily necessity type of product, e.g. an analgesic can be test-marketed at any time of the year. Test-markets must be avoided during the monsoon months of June to August. During this period, it is difficult to monitor the results of the test market due to inclemental weather conditions. Due to the rains, some of the villages get insulated from the main highways. Supplies of stocks cannot be sustained on a continuous basis. A test-market with intermittent supplies of the product will not yield representative results which can be exploited.

Competitor Reaction. It is vital to monitor competitor activities minutely during a test-market due to three reasons.

(a) Competitors can vitiate the test-market of a new brand by retailing with a series of trade or consumer promotions on their own products. These promotions may prevent the consumer from buying the new product. Thus, they can have an adverse effect on the trial rate of the new brand.

(b) Competitors can 'jam' the test market by initiating a negative word-of-mouth campaign against the new product, which could depress the stocking of the product by the retailer or the purchase by the consumer.

(c) Finally, an agile competitor could introduce one or two of new brands in these villages at the time of the test-market. A plethora of new brands in the market at the same time could lead to a total restructuring of the market. A well researched pilot study under these 'artificial' conditions would yield no useful lessons.

Media Options: In conducting a test-market the company must take cognisance of the fact that the media options available to advertise the product in the rural areas are very meagre. An ORG-MRS study reveals that readership/viewership of various communication media is as follows:

Medium	Per Cent of Rural Adult Population	Numbers 1981 Census (Million)
Press	9	32
Radio	32	113
TV	31	108
Cinema	36	12
(Total Adults 352 million)		

It is, therefore, almost impossible to use the traditional media like the press, radio, TV

or cinema. If the test-market is confined to a limited cluster of villages. Selective use of the press, radio and cinema is possible, but, only if the test-market is in a wider geographical region, like an entire political state.

Briefing of Trade: The recommendations of the rural retailer have a significant bearing on the initial trial rate and usage of a brand. It is therefore important to brief the retailer minutely about the product being test-marketed. The recommendations of the rural retailer make a significant difference since the traditional media like press, radio, TV, etc. have a meagre role in generating awareness in a limited cluster of villages.

Flow of Goods: As test-market should be conducted under stable conditions to the extent possible. In the rural areas, it is important to ensure that stocks do not move inordinately between the villages, or between the towns and the villages and vice versa. Suppose, a test-market is being organised in a cluster of villages like Bareja (population 5,000), Randneja (population 2,500) and Pethapur (population 5,000) around Ahmedabad. It is necessary to ensure that stocks do not move freely from the villages to Ahmedabad during the test-market. In case stocks travel to other villages through the wholesale channels or to Ahmedabad, the results will be distorted. The actual sales in the concerned villages will be lower than those reported, because a part of the stocks have been exported. If the product is being test-marketed in Sholapur the stocks could travel to the villages also. When a product is being test-marketed in the rural areas, it should not be tested in the larger towns in the proximity of these villages to prevent the flow of additional stocks through the wholesale channels into the test-villages. Such interflow of goods distorts the test-market results. The consumption of the product will appear to be higher or lower than the actual consumption in the concerned villages. Therefore, if a new product is being test-marketed in some villages in Gujarat, the pilot-study should be undertaken in villages like Ravapur (population: 3,200), Katariya Juna (population: 2,200), Maliya (population: 9,100), Shihori (population: 8,200), Santhalpur (population: 3,200) and Paldi (population: 2,350), which are about 300 to 400 kilometres away from a large town like Ahmedabad. This will help to minimise flow of stocks from Ahmedabad to these villages and vice versa.

Feed-back from Rural Test-Markets: The test-market has to be monitored continuously by collecting data and processing it to determine whether the marketing-mix is meeting predetermined performance standards. The type of data to be collected by the company is determined by the objectives of the test-market, as incorporated in the written brief. For instance, the company may want feedback about the features of the product, the packaging or the pricing. It may also want to get feedback about the communication message and package. The com-

pany would also want to check whether the new product was available regularly and the width of distribution among rural retailers was satisfactory. Feedback on all these aspects can be obtained by the company from its own records, rural retailers and consumers.

Product Sales Data: The quantum of stocks despatched to the test-market villages, on a daily, weekly or monthly basis, can be ascertained by the company from its own despatch points, e.g., distributor or agent. However, data regarding stocks sent should be seen as 'despatches' and not as 'sales'. Daily and weekly levels of despatches do not necessarily reflect sales, due to variables like order execution lead time, transit time delays, change in stocking levels by trade, etc. The despatches from the company's stock-point, thus, merely give information about the sales of the company. They are not an indicator of consumer offtake.

Retailer Audits: To get precise information about consumer offtake, the company has to conduct a retailer audit. It will have to monitor the sales made to each such retailer, and also collect information about the sales to consumers on a weekly basis. By checking the quantity of stocks with the retailer, at each weekly visit, the company can establish the weekly offtake of the new product among the consumers. Data regarding the number of new buyers and repeat buyers can also be collected from the retailers, provided they are briefed in advance. Retailers also provide valuable qualitative feedback about the reactions of the consumers to the product. A number of modifications to the product are frequently suggested by retailers. It is beneficial to heed their views.

Rural Consumer Panels: To garner precise data about consumer characteristics, the trial and usage rate of the brand being test-marketed, a company can set up consumer panels in the test-market villages. This panel will have to be set up at the commencement of the test-market. It should be representative of various types of rural consumers. It must, therefore, comprise of big and small farmers, professionals like school teachers or doctors, different age groups, men and women-shoppers, etc. The purchases of this panel of rural consumers will have to be monitored every month to ascertain the brands they purchase, and any shifts that take place in their buying patterns.

In a test-market, it is important to ascertain the rate of repeat buying of the new product. A consumer may buy a new product for the first time due to its novelty or a promotional offer. However, a repeat purchase of the new brand delineates some degree of satisfaction with the product. The consumer panel helps to ascertain the rates of repeat buying of the new brand by the rural consumers. The data from the consumer panel can also be used to forecast future sales and market shares for the entire region based on the brand switching

patterns among the villagers. The advantage of setting up a consumer panel is that it can also be used to garner other indicative information about the shopping habits and behavioural patterns of rural consumers.

Interviews with Women: Women are playing an increasingly important role in buying decisions in the rural areas. However, they prefer to remain in the background. They have assumed a 'behind-the-scene' role. It is immensely useful to interview a cross section of the women in the village regarding their reactions to the product being test-marketed. These interviews should be qualitative and probing in nature. Rural women are reluctant to be included in consumer panels, where they are interviewed along with other men from the village or by male interviewers from the urban areas. Their interviews should be conducted by female market research investigators.

Consumer Surveys: The company can also ascertain reactions to a new product by preparing a questionnaire and interviewing villagers who have purchased the brand. In a consumer survey, it is extremely important to design the questionnaire very meticulously, so as to incorporate all the parameters on which the company would like to obtain information. Most rural retailers know their customers by name. They also know their addresses. It is, therefore, possible to obtain names and addresses of rural consumers to be interviewed from the retailers. The company can broaden the scope of the survey to obtain information about the preferences of the consumer to a whole range of products, if so desired. A company may be test-marketing a new brand of hair oil. If it has plans to enter the field of cosmetics, it can also include questions in the survey to obtain information about other cosmetic products being used by the villagers, e.g., talcum powder, face-powder, creams, etc.

Dialogue with Opinion Leaders: To obtain qualitative reactions of the rural consumers to a new product, it is useful to meet the opinion leaders in the village, like the 'sarpanch', the school teacher, the doctor or the village development officer. Admittedly, their reactions would not necessarily be entirely representative of the rest of the villagers. Nevertheless, the qualitative feedback from these opinion leaders provides some pointers to fine-tuning products for rural markets.

With the increased prosperity among villagers, the consumption of durable and non-durable consumer products in the rural areas will increase steadily in the future. Marketers will have to develop products and marketing programmes to achieve rapid trial and product-acceptance among the rural consumers. Even though test-marketing of new products in the rural areas is an expensive proposition, in the ultimate analysis, test-markets in the villages contribute significantly to fine tuning the products and the marketing mix for the rural consumer.

Guilt of Partition

Asghar Ali Engineer

Mohammad Ali Jinnah and the Creation of Pakistan by Sailesh Kumar Bandopadhyaya; Sterling Publishers, 1991; pp 374, Rs 350.

THE partition of India was a great tragedy for nationalists and patriots. Many think that it was an avoidable tragedy. Many attempts have been made, and will continue to be made, to analyse and understand the causes of the partition of India. On the causes too, there are varying views. Some feel Jinnah alone was responsible for it. Some others say it was the divide and rule policy of the British which caused this tragedy. Some, who do not agree with these views, theorise that Nehru, Sardar Patel and other nationalist leaders were no less responsible for it. Perhaps the truth may be that all these factors contributed to the tragedy in different degrees. In any case to hold Jinnah alone responsible for it would be a gross oversimplification. It may be a soothing balm for some to hold Jinnah alone responsible but it would not be honest history.

Among many attempts to understand and analyse the causes of the creation of Pakistan, here is one more by Sailesh Kumar Bandopadhyaya. It is certainly not an original piece of research but one must say that Bandopadhyaya has tried to examine all the circumstances in which this tragedy occurred. There are, as pointed out above, many factors responsible for the creation of Pakistan. Bandopadhyaya tries to examine most of them and quite objectively. He has relied both on original as well as secondary sources but more on the latter. Perhaps this was on account of the nature of the work he has undertaken.

In view of what is happening today in Punjab and Kashmir it also becomes necessary to examine whether India would have held together today even if it had not been divided in 1947. This question, though now hypothetical, could be examined in all seriousness. Even if Jinnah had been won over by the leaders of Indian National Congress and partition averted, it is anybody's guess if serious problems would not have arisen today in holding India together. As we know, the Sikh leaders then firmly turned down Jinnah's offer to opt for Pakistan, enabling Pakistan to extend its boundary right up to Delhi. But there is deep unrest in Punjab today and a section of Sikhs are clamouring for Khalistan. Kashmiris are also crying for *azadi*. These developments

cannot be dismissed lightly. However, Bandopadhyaya does not raise any of these questions with the benefit of hindsight.

Here again the question arises: can religion be a viable basis for nationalism? Some argue that in a certain context religion can become a divisive factor, but none can seriously argue that it can become a viable basis for nationalism. The religious savants of Jami 'at-ul-' Ulama too argued, with due support from scriptures, that religion is not a viable basis for nationhood. These savants even found in the practice of the Prophet a justification for composite nationalism and hence they opposed the creation of Pakistan. Maulana Abul Kalam Azad even described the notion of Pakistan as un-Islamic. Azad also felt that creation of Pakistan would do great harm to the interests of the Muslims of the sub-continent.

Azad felt that creation of Pakistan would divide the power of Muslims, which proved true. In a united India Muslims would have been much more politically influential than they are today; they would have constituted the largest Muslim population in the world; it would have avoided the massacre of one million people at the time of the partition. Another million were killed—all Muslims this time—when Bangladesh violently separated from Pakistan. Creation of Pakistan, with all this unprecedented sacrifice of human lives, did not, in any measure, succeed in providing a solution to the communal problem. Communal riots continue to take place in India. Pakistan too is rocked by ethnic riots between Sindhis and muhajirs and muhajirs and Pathans. The problem, if anything, has become more complicated. Bandopadhyaya does not deal with these questions, important though they are.

The first chapter of the book has been titled 'Apologia' perhaps because the author tries to show therein that Jinnah in his early years was a staunch nationalist. He defended Tilak gallantly when Tilak was charged with sedition. Jinnah also had great regard for Gokhale so much so he was described as a Muslim Gokhale by friends. In 1925 when the young Raja of Mahmudabad told Jinnah that he considered himself a Muslim first,

instantaneous was the retort of Jinnah: no, he should consider himself an Indian first then a Muslim. The author also draws readers' attention to the reported conversation of Jinnah with Horniman, the then editor of *Bombay Chronicle*, to suggest that "the sect amongst Muslims to which he belonged believed in the ten avatars and had much in common with Hindus in their inheritance laws and social customs".

Not only this; Jinnah, ironical though it might appear now, was opposed to the formation of the Muslim League in 1906. The author points out, "Jinnah kept himself aloof from the Muslim League as a matter of conviction. Subsequently, referring to the opposition of Jinnah to the activities of the Muslim League during its formative years, Aga Khan, the principal architect of the organisation had to observe: "Our doughtiest opponent in 1906 was Jinnah who came out in bitter hostility toward all that I and my friends had done and were trying to do... He said that our principle of separate electorates was dividing the nation against itself."

How is it then that the staunch opponent of Muslim League and separate electorates became not only a champion of the Muslim League and its supreme leader but also the bitterest critic of united Indian nationalism and the creator of Pakistan on the basis of the two-nation theory. The rest of the book is a search for an answer to this question. Bandopadhyaya does not come out with any hitherto unknown answers, or for that matter any hitherto unknown historical facts, but certainly makes an honest attempt to search for an answer—by no means an easy task. It must be said to his credit that the author discusses the entire gamut of the problem with a sense of balance and poise.

The first watershed, according to this reviewer, in bringing about the transformation in Jinnah's attitude was the discussion on the Nehru Committee Report in 1928. Jinnah was looking for an honest solution to the communal problem through the recommendations of the Nehru Committee. He had even persuaded Muslim leaders in their Delhi conference held on March 20, 1927 to accept joint electorates subject to certain conditions which the Congress also had accepted. The League had decided to participate in the All-Parties Conference at the invitation of the Congress on the basis of Delhi Muslim proposals. However, the All-Parties Conference held in Delhi in February 1928 began to deviate from the Muslim proposals right from the beginning. The

author has examined this in detail. Jinnah had proposed that the Muslim representation in central legislature be one-third, that in the absence of adult suffrage as proposed in the Nehru Report, Punjab and Bengal should have seats on population basis and no more and that residuary powers should rest in the provinces and not in the centre.

Though some Muslim leaders like Azad, Ansari, Ali Imam and Kichlew were in favour of the Nehru Report, many others were not and Jinnah's proposals were rejected by the All-Parties Convention due mainly to the tough stand taken by the top Hindu Mahasabha leaders and Sikh leaders. Jinnah was greatly disillusioned and it was the turning point in his political career. Speaking on the Nehru Report, Jinnah, as quoted by the author, had said, "...what we want is that Hindus and Muslims should march together until our objective is attained. Therefore, it is essential that you must get not only the Muslim League but the Musalmans of India and here I am not speaking as a Musalman but as an Indian. And it is my desire to see that we get seven crores of Musalmans to march along with us in the struggle for freedom..."

Citing examples from the constitutions of several countries, Jinnah observed, according to the author, that minorities are always scared of majorities. He was of the opinion that religious majorities were generally tyrannical. Therefore, he felt that minorities had the right to seek safeguards. This was the crux of the matter. It was not a question of religion but a question of interests, the majority normally dominating and denying even the legitimate interests of the minorities. Jinnah, in keeping with the apprehensions of the Muslim minority, was demanding certain crucial safeguards. The Hindu Mahasabha not only rejected these safeguards, a section of the Congress delegates misbehaved with Jinnah.

In fact a crucial chance was missed. Commenting on the failure of the Nehru Report, a League leader later observed: "The Hindu leadership lost the chance of securing their pet theme of a joint electorate, to which even the Muslim League under Jinnah's guidance had committed itself on March 20, 1927 and subsequently by the decision of the Calcutta All-India Muslim League session. Let the Hindu youth of India ponder over these bungleings of their leadership at that time before they blame the Muslims for the partition of the country."

The author has, it must be said, very objectively and impartially dealt with the developments after the report of the Nehru Committee was published. The author also deals with the question of the

round-table conference and Jinnah's role in it with the same objectivity. The conference drew a blank and no agreement could be reached on the crucial communal question. It must be noted that again an attempt was made by the Indian leaders to reach a settlement on the communal question at Allahabad in November 1932. Pandit Malaviya and others after a few days' deliberations devised a formula according to which Muslims would be allotted 32 per cent of the seats in the central legislature, Muslims would accept a joint electorate and Sind would be separated from Bombay province if no additional revenue assistance was demanded. The Muslims of Bengal and Punjab were also allotted 51 per cent of the seats. But before a formal agreement could be reached, the secretary of state for India, Samuel Hoare, announced the Communal Award conceding 33 1/3 per cent seats to the Muslims. This award frustrated the unity efforts. Thus the British divide and rule policy played no insignificant role in bringing about the division of the country.

The author also deals with the complicated developments after the 1937 elections and the question of including the League in the UP ministry. He has nothing new to say as the ground has been covered by several scholars already. Similarly, the author has nothing much to add on the Cabinet Mission Plan, Nehru's press statement about its non-finality and Jinnah's rejection of the Plan on that basis. In fact,

so much has already been written on all this that it is very difficult to say anything fresh on these issues. However, it is worth repeating all this for an objective analysis of the events leading to the creation of Pakistan. The author acquits himself creditably on this count. The book will be found worth reading by those who are not well acquainted with the developments of the period between 1937 and 1947 which is a crucial decade. It was a most difficult decade and before fixing responsibility for the creation of Pakistan on any single individual, party or group it is very necessary to grasp all the events which took place during this decade.

According to this reviewer, towards the end of 1946, when the provisional government was formed, the most crucial question was the division of powers—residual and others—between the states and the centre. Nehru and Patel, it seems, were not very enthusiastic about a weak centre which is what the Cabinet Mission Plan was about. Both wanted a strong centre for different reasons. The choice thus was between a weak centre and united India and a strong centre and divided India. Though the choice was very difficult and painful, it was very crucial. Who chose what is history now. But it should be considered as one—and only one—factor in the complicated drama. One can apportion blame only by emphasising some and de-emphasising some other factors. But that will detract from objectivity.

TECHNOLOGY AND COMPETITIVENESS

The Case of Brazilian and Indian Machine Tools

JAN PETER WOGART, AASHA KAPUR MEHTA and ARUN MEHTA

Industrial development throughout the world is being increasingly linked to technological developments and their adoption in industrial production. Given this framework, this study discusses major issues concerning the development of industrial technology in general and the impact of the electronics revolution in particular. It also examines the role of the government in targeting and supporting this high-tech sector, and makes policy recommendations based on comparisons of more and less successful countries. Using the Brazilian and Indian machine tool industries as examples, the authors show that excessive protection is counter-productive in industries undergoing rapid technological change.

Employment: Asian Experience

Tirthankar Roy

Employment Challenges for the 90s by ILO-ARTEP, New Delhi; pp 147.

CREATION of employment has been a major goal of economic policy in the countries of Asia, one of the world's most populated regions. But like economic growth, experience with job-creation has been uneven, and so has been the composition and quality of the labour force. The volume under review contains four essays describing and explaining these differences, identifying new areas of concern, and suggesting agenda for policy. The papers, written by members of the ARTEP (Asian Regional Team for Employment Promotion), were first presented at a seminar in Delhi. The four papers address, in that order, how the speed and quality of economic growth matter in job-creation, why women's participation in the workforce changes, what are the potentials and nature of jobs in the urban informal sector, and how urban planning matters in employment growth. By and large, the papers do not present original research, but summarise existing research. But they are easily readable, contain essential comparative statistics without being overburdened with data, and can be a useful introductory text for anyone interested in employment and labour market issues in Asia.

The Introduction by Gus Edgren and the paper by Edgren and M Muqtada explore the connection between growth and employment through contrasts between the east Asian NICs, the ASEAN, and the south Asian economies. In the last two decades, the share of agriculture in GDP has declined, but the employment-shares have changed more slowly. The paper contrasts two types: one in which services and manufacturing both expand in employment-shares (the NICs), and the other in which mainly services have grown, and suggests that the share of manufacturing indicates whether services growth "connotes dynamism or distress adaptation". The greater employment-elasticity in the NICs is attributed to the inherently labour-using nature of export-led growth, specially when accompanied by an incentive structure that does not favour capital, and by a concern for 'setting prices right'. However, the strategy also exposes economies to risks of changing relative costs and overseas demand factors unless domestic capabilities expand in the form of rising quality of the labour force. This 'human resource development' depends in particular on rural primary education. The experience, and partly the explanation, of labour absorption in agriculture is similar. In the course of agricultural growth labour-use increased in east Asia,

whereas HYVs led to an early mechanisation elsewhere. However, even in the latter, increased productivity and commercialisation, hold promises for employment expansion in rural non-farm sectors and agro-processing.

If one were looking for 'lessons' in success stories, one could be disappointed, for country experiences cannot be exactly transplanted, nor the same measure of success expected, in a changing world. Edgren and Muqtada conclude that the policy-agenda for India, say, "will have to exploit own situation as much as possible, relying increasingly on available resources and markets, and allowing structural change to take place through efficiency and productivity, through infrastructure and human resource development" (p 49). This combines the best part of east Asian experience with a measure of pragmatism. However, on policies specifically addressed to employment-elasticity of growth, the prescriptions might seem too general. In part, the policy agenda is constrained by an uncertainty about sectors like construction or rural non-farm, and by the sheer impossibility of doing anything with the urban informal, leading to the suggestion of "benign neglect". To call it a 'policy' is a little curious.

Economic growth induces women's participation in the workforce by opening up opportunities. Women's participation, in turn, could measure the quality of the labour force, and reduce population growth by lower fertility rates. A V Jose shows that rates of participation have increased uniformly in nearly all countries of Asia, but the occupational and age distributions of the new entrants vary. In general, education and better opportunities for the adults tend to remove the children and adolescents from the workforce. And economic growth pushes more of the new entrants into industry and services. Neither has happened in south Asia. Increased participation of women can, however, co-exist with gender disparities in earnings and mobility. This is partly determined by the conventions that govern 'exclusion' and 'selection' of women into specific jobs. The evidence suggests that education works in removing these barriers, but very slowly even in the rapidly growing economies.

The macro-economic issues addressed in informal sector research have hardly changed over the past decade: how large, how productive, is growth dynamic or 'involuntary', and so on. There is, however, a point in assembling recent findings, as Ola Hallgren, Rizwanul Islam, and
